
Every Essene rose before sunrise, and with his face turned toward the east, repeated his morning prayer. As soon as the light permitted they commenced their daily labors, farming, bee-keeping, cattle-raising, and such-like humble occupations. Each little colony had in

its midst a room or hall where the members met together at regular hours daily. They kept apart from commerce, war, and trade. Their dress was as plain and simple as possible—a light, sleeveless garment in summer, and in winter a warm hairy mantle. They cared only for decency and a moderate degree of comfort; all luxury and show were unknown among them. Both during winter and summer they wore leathern aprons. At 11 A.M. they ceased work, bathed, dressed themselves in spotless white linen, and assembled for their simple meal. A blessing was asked before the meal, and thanks returned after by a priest. They were both vegetarians and total abstainers. At the close of the meal they sung a hymn, and then worked again until sunset. The seventh day was one of perfect rest. On it they read and expounded the Law and their own peculiar writings. As their asceticism prohibited them from partaking of the feasts held at Jerusalem, and their mode of worship interfered with their entering the Temple, they broke the Law in one important point—they did not attend the regular feasts at Jerusalem. They forwarded their gifts instead. The majority of them were celibates, and they kept up their numbers by adopting children, whom they taught with great care and patience. If a man wished to join them, he was obliged to submit to a three years' novitiate, being rigidly excluded from their gatherings. At the end of each year he was advanced by ceremonies and privileges, and after three years became a full member. The only time oaths or vows were allowed was during the initiation into full membership. The candidate was bound by tremendous oaths to be worthy of the order and obedient to its rules. The Essenes were never very numerous. Philo gives their number as 4000. After the destruction of Jerusalem they disappear from history.

They believed in the immortality of the soul, in a fixed Providence, in the future rewards of the righteous, and punishment of the wicked. They did not believe in the resurrection of the body. They were said to practise magic, and were believed by all Jews to have prophets among their members. It is probable that they derived from the Zoroastrian religion their celibacy, sun homage, abstinence from sacrifice, magical rites, and intense striving after purity. They were everywhere known for their kindness to the sick and poor. Their knowledge of roots and herbs enabled them to perform many acts of healing that to the spectators seemed miraculous. They were greatly averse to slavery, and always opposed it. With few exceptions they abstained from all public affairs, being invariably modest and retiring. Philo gives the three chief rules of their conduct as follows: "The love of God, the love of virtue, and the love of man." It has been the theory of some rationalists that Jesus spent some time among the Essenes, and sought to widen and propagate their theology and communism. (See De Quincey's *Essays on the Essenes*.)

ESTATES (from Lat. *status*, stand or status) is used in political history for classes or orders in society. Since the earliest civilizations the tendency to make distinctions in the

relative position of one set of people toward others has appeared. Plato, in his *Republic*, divides men into three classes: philosophers or magistrates, warriors or gymnasts, and laborers or artisans. The first are the wise thinkers, who are fit to rule; the second the fighters—men of force and action; the third are the bulk of the common people, whose first care is the supplying of every-day necessities; and as the one or other element predominated in the nature of the individual, so he became either philosopher, warrior, or artisan. What was first, however, the natural selection of ability soon becomes a matter of inheritance; and after a time the distinction was looked upon as a direct act of Deity. The castes of India, the part and parcel of the Brahman religion, are unmistakably of such origin. According to Brahman theology, Brahma created three different men: one, the *Brahman*, emanated from his head, and was endowed with all knowledge of science and art; he has all wisdom and is king and head of all the earth. The second, the *Kohatriya*, came from Brahma's arms, and it was his right and duty, under the control of the Brahman, to make war and peace, to make laws and execute them, and to maintain social order and the division of the castes. The *Vaisyas* sprang from Brahma's feet, and were the tillers of the soil, the artisans, upon whom devolved the supplying of all the physical needs of humanity.

The development of the modern "estates of the realm" was brought about originally by the same natural selection of the fittest leaders of thought and the strongest protectors. In France, before the Revolution of 1789, the three estates were king, nobles, and clergy; while the three estates in England were king, lords, and commons. The substitution of commons for clergy in England was the direct result of the Reformation, and of the more independent thought of the English people. The conditions which M. Taine speaks of as being the reason of the power of the clergy undoubtedly still held good to some extent in England till Henry VIII. confiscated all their property. The English clergy, like their brethren in other new civilizations, were not only the most learned men, but also by their tact became powerful in the affairs of the nation. When, however, the Reformation swept away their monopoly of power over men's consciences, and when they lost their enormous estates, a new element began to arise. From early times the system of guilds had developed a certain amount of local self-government among the commoners, who had thereby gained confidence in their own judgment; and now a wish to act for themselves in matters concerning the whole nation grew up, which finally led to the execution of Charles I. and founding the Commonwealth. From that time the clergy ceased to have an independent standing of their own; and to-day the bishops have seats in the House of Lords by right of their office, they are practically no more than a section of the privileged class. Their place as rulers was taken by the wealthy commoners.

In France the "three estates" continued to hold sway long after their beneficial effects had ceased; until, indeed, the load of oppression

had become more than could be borne. As there was not even a nominal representation of the people, the evils continued until the volcanic wrath of the people swept away all three estates, and put the management entirely into the hands of the bourgeois commoners. They, however, were not yet equal to the task, and the warrior had again to be looked up to. The bourgeois were called the fourth estate; but the great mass of the people—the working people—are not of any estate as yet, tho the lesson of history goes to show that in due season there will be no distinctions of estates or classes. Modern socialism is sometimes considered the rising of the fourth estate, which shall abolish all estate and introduce equality. (See DEMOCRACY; SOCIALISM.)

ETHICS AND SOCIAL REFORM. See MORAL ELEMENT IN SOCIAL REFORM.

EVANGELICAL ALLIANCE, THE, organized in London in 1846, through the efforts of the Rev. William Patton, D.D., and to-day with branches in all portions of the world, has in its meetings, conventions, etc., given increasing attention to social reforms. Many of the most important recent utterances on the relation of Christianity to social reform (*q.v.*) have been made at its meetings. The Evangelical Alliance in the United States is now organizing local branches "to bring conscience to bear on the life of the nation; to close the chasm between the churches and working men; to gain the strength which comes from organization." It suggests committees on the following lines of work:

1. *Comity*.—Through this committee the various church extension societies of the city should be brought into touch, so as to prevent overlapping in some neighborhoods and neglect in others.

2. *Social Conditions*.—This committee should investigate the religious and social conditions of the community and of the surrounding country. They may appropriately form neighborhood or Church Reading Circles, Home-culture Clubs, and Maternal Associations. By enlisting the cooperation of a large number of judicious women, and assigning to each a small district, the churches can come into friendly and helpful personal relations with all of the needy homes of the community, and bring to them blessings, sanitary, economic, domestic, and spiritual.

3. *Evangelization*.—Through this committee the Alliance should care for the religious needs of prisons, workhouses, and neglected neighborhoods.

4. *Relief*.—To this committee will be referred cases of sickness and want not otherwise provided for.

5. *Temperance*.—This committee may profitably undertake, through subcommittees, work along various lines—*e.g.*, public meetings, the organization of church temperance societies, the systematic distribution of wisely selected temperance literature, the study of the local problem, with a view to finding the best solution, etc.

6. *Sunday Observance*.—Much can be done to improve Sabbath observance by showing the people the basis on which our Sabbath laws rest, which is very commonly unknown, especially by foreigners. Members of Endeavor Societies, Epworth Leagues, and the like might render great service by systematically distributing Sunday and temperance literature.

7. *Law and Order*.—Under this general head special attention will be paid to *saloons, disorderly houses, gambling, and Sabbath desecration*. The town should be districted and each member of the committee assigned a district, in which he will keep vigilant watch of all law-breakers.

8. *Legal Advice*.—Good legal advisers will be necessary.

9. *Publication*.—An important service is rendered by preparing a digest of the liquor, tobacco, gaming, and Sunday laws of the State; also of the laws speci-

fying the duties of public officials, such as Mayor, Prosecuting Attorney, the Board of Excise, Excise Inspector, the Police, etc. Knowledge of the fact that the public is well acquainted with the law will often bring officials up to duty, and also prevent the violation of law. Furthermore, knowledge of the law serves to strengthen public opinion in regard to its enforcement. This digest should be widely scattered.

Further service is rendered by first carefully verifying facts concerning the characters and records of unworthy candidates and of unfaithful officials, and then giving them publicity in a non-partisan way. An association of citizens in Boston so exposed an unworthy candidate for the mayoralty as to force him to leave the city.

10. *Municipal Reform*.—Instead of "going into politics," the Alliance will aim through this committee to separate municipal elections from State and National politics. It will insist on the official fitness of candidates, oppose incompetent and corrupt men, and sustain the constituted authorities in a faithful administration of the public service.

11. *Civic Improvements*.—Most cities in the United States are in need of public baths and lavatories. Many young and growing cities neglect to make adequate provision for parks until it is too late.

To this committee many suggestions for the public good will come, also complaints of abuses and nuisances. These latter, after first being investigated, should be referred to the proper authorities. Care should be taken not to antagonize officials unnecessarily.

12. *Labor*.—Through this committee the Alliance will seek to aid labor reforms, to encourage the arbitration of labor difficulties, to establish labor bureaus, form working girls' clubs, encourage cooperative housekeeping for self-supporting girls, oppose the sweating evil and child-labor, and demonstrate to working men the desire of the churches to serve them in every legitimate way.

13. *Education and Recreation*.—This committee will seek to create an intelligent interest in the public schools, to take the schools out of politics, to see that buildings are sanitary and that they provide adequate accommodations, that school laws, like that requiring instruction as to the effects of alcohol and narcotics on the human body, are enforced, and that the schools enjoy the best facilities for attaining the highest efficiency. This committee might appropriately consider the introduction of university extension, the kindergarten, manual training, cooking, and sewing classes, the English continuation and recreation schools, playgrounds, summer excursions for poor children and sickly mothers, outing clubs, fresh air funds, holiday houses, and the like.

14. *Legislation*.—This committee, by means of petitions and protests, will bring to bear the Christian conscience of the community on the legislature of the State with a view to encouraging good and defeating bad legislation touching social, moral and religious interests. Before the legislature convenes, this committee should district the community and assign to each district a competent person, who, on short notice, will circulate such petitions or protests as the Alliance may decide to send to the legislature.

Further information can be had from the general secretary of the Evangelical Alliance, United Charities Building, Fourth Avenue and Twenty-second Street, New York.

EVANS, FREDERICK WILLIAM, was born in Bromyard, England, in 1808. Spending his boyhood on a farm, he came to America with his father and brother, George Henry Evans (*q.v.*), in 1820. Apprenticed to a hatter, he managed to educate himself, and later traveled as far as New Orleans, also paying a visit to England. In 1830 he joined the Shakers at Mount Lebanon, N. Y., and in 1838 became assistant elder in the "North Family," and in 1858 elder of three families. From 1873-75 he edited a little paper, *The Shaker and Shakeress*. He has written *Compendium of Principles, Rules, Doctrines, and Government of Shakers*, with biographies of Ann Lee and

City Reforms.

others (1859); *Autobiography of a Shaker* (1869); *Tests of a Divine Revelation* (1869); *Shaker Communism* (1871); *Religious Communism*, a lecture delivered in St. George's Hall, London (1872); *The Second Appearing of Christ* (1873).

EVANS, GEORGE HENRY (brother of the above), was born in Bromyard, England, in 1805. He came with his father and brother to America in 1820. He edited and published the first labor papers in America: *The Man*, at Ithaca, N. Y., about 1822; *The Working Man's Advocate*, New York, a part of the time 1825-30; *The Daily Sentinel* in 1837 in New York, and *Young America* in New York and Rahway, N. J., 1853. The demands advocated by Evans and printed at the head of *Young America* were: 1. The right of man to the soil. "Vote yourself a farm." 2. Down with monopolies, especially the United States Bank. 3. Freedom of public lands. 4. Homesteads made inalienable. 5. Abolition of all laws for the collection of debts. 6. A general bankrupt law. 7. A lien of the laborer upon his own work for his wages. 8. Abolition of imprisonment for debt. 9. Equal rights for women with men in all respects. 10. Abolition of chattel slavery and of wages slavery. 11. Land limitation to 160 acres. 12. Mails in the United States to run on the Sabbath. Later G. H. Evans became a friend of Horace Greeley, and followed the political movements of the time with interest. He died in Granville, N. J., in 1855.

EVENING SCHOOLS.—The first evening school for boys and girls who had to work all day was founded in Bristol, England, in 1806, by the Benevolent Evening Schools Society. In 1811 the Rev. T. Charles established an evening school for adults at Bala, Merionethshire. In the course of a few years 30 towns possessed such schools. Bishop Hinds first *publicly* suggested the state establishment of evening schools in a letter to Mr. Senior, printed in 1839. In 1875 there were 73 such schools. At present Kings College, the University of London, the colleges at Nottingham, Cardiff, Newcastle, Bristol, report evening classes, with students varying from 700 to 2000 or more, while in London various technical and popular institutes do their main work in evening classes. These of course are mainly for working men and women. Some of the trade-unions have taken a leading part in establishing "recreative evening schools" in England.

In France, Italy, and Germany evening schools exist for children employed in factories. In Germany, Sunday-schools long alone met this need; but the evening schools are replacing these for adults.

In the United States the last census says:

"The available reports for public night schools justify the following statement, as approximately indicating the enrolment in the States named:

	Enrolment.
The United States.....	163,509
North Atlantic division.....	127,399

	Enrolment.
Maine.....	1,000
New Hampshire.....	1,200
Vermont.....	200
Massachusetts.....	24,820
Rhode Island.....	7,623
Connecticut.....	2,883
New York.....	55,000
New Jersey.....	6,673
Pennsylvania.....	28,000
South Atlantic division.....	3,510
Delaware.....	250
District of Columbia.....	2,510
Virginia.....	550
South Carolina.....	200
North Central division.....	26,800
Ohio.....	2,700
Illinois.....	10,000
Michigan.....	1,100
Wisconsin.....	3,000
Minnesota.....	5,500
Iowa.....	1,000
Missouri.....	2,200
Nebraska.....	1,300
South Central division.....	1,400
Kentucky.....	1,400
Western division.....	4,400
Colorado.....	200
Oregon.....	200
California.....	4,000

Says the census:

"Many cities maintain schools from 7 to 9 o'clock P.M. for from 30 to 90 or more sessions between November and May, presumably for those deprived of the benefit of ordinary schools by age or occupation.

"The tone of reports on these evening or night schools is more of faith in their future possibilities than of confidence in their present usefulness. Meagre numbers, irregular attendance, difficulty of discipline, exhaustion of both pupils and teachers by the employments of the day, damage to day schools by a loss of power in those who teach in night schools as well as day schools, are general comments relieved by some statements of excellent results.

"A somewhat common experience is a zealous fall opening, a good degree of interest to the Christmas holidays, then a break in the attendance and interest, followed by a more or less protracted struggle against decline till it is decided that the schools had better be closed."

EVOLUTION AND SOCIAL REFORM.

—That biological principles and the teachings of the evolutionary philosophy have an important bearing on social reform is to-day all but universally admitted; yet, strange to say, even the best writers and authorities are utterly disagreed as to the reform position to which these principles lead. Mr. Herbert Spencer and some other writers use the theory of evolution as an argument against state interference with private property and the necessity of industrial competition to human progress. Mr. Benjamin Kidd is equally clear that evolution teaches the necessity of a great expansion of state interference, tho it must be an interference which shall preserve and not destroy competition. Professor Huxley uses biology to ridicule Spencer's position, while Professor Ritchie and most socialists make biology prove the necessity and practicability of an organic social life, where industrial competition shall disappear. Finally Pro-

fessor S. N. Patton, in his *Theory of Social Forces*, a work published in January, 1896, says (p. 5): "Even the theory of evolution has had as yet but little influence on the social concepts and ideals of the race;" and he argues that economics are psychological quite as truly as biological. To understand this confusion it is necessary to ask what evolution is.

"Evolution," says Professor Huxley (*Evolution in Biology*), "is at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it." He says again (*American Addresses*, p. 10): "The hypothesis of evolution supposes that in all this vast progression there is no breach of continuity, . . . but that the whole might be compared to that wonderful process of development which may be seen going on every day under our eyes, in virtue of which there arises out of the semifluid, comparatively homogeneous substance, which we call an egg, the complicated organization of one of the higher animals."

Definitions of Evolution.

But we can be more definite than this. Says Spencer (*First Principles*, § 145):

"Evolution is an integration of matter and concomitant dissipation of motion, during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, and during which the retained motion undergoes a parallel transformation." But the word is often used in a still narrower sense than this, a sense which identifies it with some form of what is often also called Darwinism, and which makes it the theory of "the derivation or descent, with modification, of all existing species, genera, orders, classes, etc., of animals and plants from a few simple forms of life, if not from one" (*Century Dictionary*).

Thus far all authorities are practically agreed. But when we come to ask how this evolution has taken place we find more disagreement. We do not here refer to the fundamental questions of how evolution started; whether it is teleological; what it teaches concerning the existing of a divine power in or above nature. With these questions we are not here concerned. But the authorities differ even as to the ways in which evolution works wholly apart from the question of its origination or any divine element in it. There may be more agreement than first appears, but it is necessary to refer to the different views of evolution in order to understand their bearing on social reform.

The evolutionary hypothesis did not originate with Charles Darwin. The general thought of evolution is as old indeed as the Indian mystics and the Greek physicists. It finds a comparatively clear expression in Leibnitz's principle of continuity, and plays no small part in all German philosophy. Even in its Darwinian form it appears quite explicitly in the writings of Lamarck (Paris, 1809-22), of Dr. W. C. Wells, of Charleston, S. C. (1813), and of Sir Charles Lyell (1850). Lamarck taught, among other things, that the production of a new organ in an animal body results from the superintention of a new want (*besoin*) continuing to make itself felt, and a new movement which this want gives birth to and encourages.

It is this law which has been principally associated with Lamarck's name, and is often referred to as his hypothesis of the evolution of organs in animals by appetite or longing, although he did not teach that the animal's desires affect its conformation directly, but that altered wants lead to altered habits, which result in the formation of new organs, as well as in modification, growth, or dwindling of those previously existing.

Mr. Alfred Wallace, as early as 1855 (*Ann. and Mag. Nat. Hist.*, 1855), formally announced his belief in the

theory of descent of species, and intimated that the manifest adaptation of certain varieties to their surroundings secured them the best chances of perpetuation. Later records show that Mr. Wallace did not stop at this stage of development.

But it was Charles Darwin who, in his great book *The Origin of Species*, first placed the idea of evolution clearly before the world and gained the gradual assent of almost the whole thinking world to his argument in general, if not in detail. Darwin's theory has as its special points the inherent susceptibility and tendency to variation according to conditions of environment; the preservation and perfection of organs best suited to the individual in its struggle for existence; the perpetuation of the more favorably organized beings, and the destruction of those less fitted to service; the operation of natural selection, in which sexual selection is an important factor; and the general proposition that at any given time any given organism represents the result of the foregoing factors, acting in opposition to the hereditary tendency to adhere to the type or 'breed true.' Since Darwin's day two main schools have arisen. One school, sometimes called the Lamarckian, holds to the distinguishing principle of Lamarck, that acquired variations can be transmitted, and that since these variations are and must be adapted to external agencies and surroundings, and hence of greater value to the individual and the race, such variations are most important in the differentiation of new forms of life. The other school, following Weismann in Germany, has in the name of pure Darwinism or neo-Darwinism claimed that there is no satisfactory evidence that those variations which are the result of mechanical causes (acquired variations) can be inherited, that every instance in which the effects of use and disuse, of mutilations and prenatal influences and the like are supposed to be shown are capable of another explanation.

Most embryologists to-day probably incline to the school of Weismann; but the other side is ably supported, nor must it be forgotten that both sides admit that some variations at least can be transmitted.

Nor must the agreement of the two schools and the general acceptance by all biologists of the principle of evolution by the struggle for life and the survival of the fittest be forgotten. Says Mr. Benjamin Kidd (*Social Evolution*, p. 34):

"Progress everywhere from the beginning of life has been effected in the same way, and it is possible in no other way. It is the result of selection and rejection. In the human species, as in every other species which has ever existed, no two individuals of a generation are alike in all respects. There is infinite variation within certain limits. Some are slightly above the average in a particular direction as others are below it, and it is only when conditions prevail which are favorable to a preponderating reproduction of the former that advance in any direction becomes possible. To formulate this as the immutable law of progress since the beginning of life has been one of the principal results of the biological science of the century, and recent work, including the remarkable contributions of Professor Weismann in Germany, has all tended to establish it on foundations which are not now likely to be shaken."

With such a succinct statement as to the views of various schools of biologists as to evolution, we are now able to better understand the bearings of their views on social reform. That such a view must have deep bearing on social reform is obvious. That man's development is subject, in part at least, to the same laws which govern the development of plants and brute animal life no thinking man to-day denies, though, as we shall see, good authority questions whether these are the only laws which control human progress. We pass, therefore, to consider the different applications of evolutionary thought to social reform.

The leadership in the application of the doc-

trine of evolution to social science belongs undoubtedly to Herbert Spencer (*g.v.*), tho by no means all scientists follow his conclusions. Comte had already prepared the way by treating of human history as a natural process of continuous development, and much German philosophy tends the same way. But Herbert Spencer's *First Principles* (1862) first developed this thought into a connected system (*Synthetic Philosophy*), while his other works apply the thought to psychologic religion, ethics, sociology, education, etc. Bagehot's *Physics and Politics* applies the thought to politics. John Fiske's *Cosmic Philosophy* applies it still more to man's origin and development.

Herbert Spencer makes biology teach the folly of state intervention and the necessity of industrial competition. He argues that it is absolutely necessary to human progress that each individual should stand on his own legs, and that the "fittest" should survive. The struggle, he says, should go on "without violence" (*The Sins of Legislators in The Man versus The State*), but government should not interfere. He believes this process to be really benevolent, and says, "the poverty of the incapable, the distresses that come upon the imprudent, the starvation of the idle, and those shoulderings aside of the weak by the strong, which leave so many in shallows and in miseries, are decrees of a large, far-seeing benevolence" (quoted by Mr. William M. Salter in *Anarchy or Government from Social Statics*, and said by Mr. Salter to be reaffirmed with approval [save as regards its teleological implication] in *The Sins of Legislators, The Man versus The State*).

Mr. Spencer also believes this competition to be just. Each one should gain "neither more nor less of benefit than his activities normally bring" (*Sociology*, vol. ii., § 575). "The superior," he says, should "have the good of his superiority, and the evil of his inferiority," and he would put a "veto on all public action which abstracts from some men part of the advantages they have earned, and awards to other men advantages they have not earned" (*ibid.*, vol. ii., § 567).

Mr. Spencer gives particular instances of what he means—he condemns public libraries, public museums, and public schools, since these mean the taxation of the more well-to-do for the benefit of the less well-to-do, and every one, he maintains, should have all the benefits of his exertions to himself, and none should have more benefits than his own exertions entitle him to (*The Sins of Legislators and the Great Political Superstition, in The Man versus The State*. Cf. *Sociology*, vol. ii., § 569).

This gives Mr. Spencer's general position, which he has developed at length in his *Social Statics, Man versus The State*, etc. (For a fuller statement of his view, see SPENCER.)

On questions of the method in evolution, Mr. Spencer follows the Lamarckian view. Mr. Benjamin Kidd, however (in his *Social Evolution*) takes Weismann's theory. Of the bearing of this difference on social reform, Mr. Kidd says (p. 191):

"If the old view is correct and the effects of use and education are transmitted by inheritance, then the Utopian dreams of philosophy in the past are undoubtedly possible of realization. If we tend to inherit in our own persons the result of the education and mental and moral culture of past generations, then we may venture to anticipate a future society which will not deteriorate, but which may continue to make progress, even tho the struggle for existence be suspended, the population regulated exactly to the means of subsistence, and the antagonism between the individual and the social organism extinguished, even as Mr. Herbert Spencer has anticipated" (*Data of Ethics*, chap. xiv.). "But if, as the writer believes, the views of the Weismann party are in the main correct; if there can be no progress except by the accumulation of congenital variations above the average to the exclusion of others below; if without the constant stress of selection which this involves, the tendency of every higher form of life is actually retrograde; then is the whole human race caught in the toils of that struggle and rivalry of life which has been in progress from the beginning. Then must the rivalry of existence continue, humanized as to conditions, it may be, but immutable and inevitable to the end.

Benjamin
Kidd.

Mr. Kidd argues that this is the law of all progress. He says (pp. 35-37):

"Looking back through the history of life anterior to man, we find it to be a record of ceaseless progress, on the one hand, and ceaseless stress and competition, on the other. This orderly and beautiful world which we see around us is now and always has been the scene of incessant rivalry between all the forms of life inhabiting it—rivalry, too, not chiefly conducted between different species, but between members of the same species. The plants in the greensward beneath our feet are engaged in silent rivalry with each other, a rivalry which if allowed to proceed without outside interference would know no pause until the weaker were exterminated. . . . The trees of the forest which clothe and beautify the landscape are in a state of nature engaged in the same rivalry with each other. Left to themselves, they fight out, as unmistakable records have shown, a stubborn struggle extending over centuries, in which at last only those forms most suitable to the conditions of the locality retain their places.

"But so far we view the rivalry under simple conditions; it is among the forms of animal life as we begin to watch the gradual progress upward to higher types that it becomes many-sided and complex. It is at this point that we encounter a feature of the struggle which recent developments of biological science tend to bring into ever-increasing prominence. The first necessity for every successful form engaged in this struggle is the capacity for reproduction beyond the limits which the conditions of life for the time being comfortably provide for. . . . Recent biological researches, and more particularly the investigations and conclusions of Professor Weismann, have tended to greatly develop Darwin's original hypothesis as to the conditions under which progress has been made in the various forms of life. It is now coming to be recognized as a necessarily inherent part of the doctrine of evolution, that if the continual selection which is always going on among the higher forms of life were to be suspended, these forms would not only possess no tendency to make progress forward, but must actually go backward. That is to say, if all the individuals of every generation in any species were allowed to actually propagate their kind, the average of each generation would continually tend to fall below the average of each generation which preceded it, and a process of slow but steady degeneration would ensue."

Natural
Selection.

Mr. Kidd applies this principle to man, and says (pp. 31-34):

"These laws, the observer soon convinces himself, have not been suspended in human society. On the contrary, he sees that they must have their most important seat of action there. To recognize this truth, one has only to remember that the discovery which in our time has raised biology from a mere record of isolated facts to a majestic story of orderly progress was not

suggested by the study of life among the lower animals. The law, by the enunciation of which Darwin most advanced the science of the nineteenth century,

Applied to Man.

took shape in the mind of the great biologist, after observation of human society—that society in particular which we see around us at the present day. Speaking of the workings of his mind before the *Origin of Species* was begun, Darwin says: 'In October, 1838—that is 15 months after I had begun my systematic inquiry, I happened to read for amusement Malthus on population; and being well prepared to appreciate the struggle for existence which everywhere goes on, from long-continued observation of the habits of animals and plants, it at once struck me that under these circumstances favorable variations would tend to be preserved and unfavorable ones to be destroyed. The result of this would be the foundation of a new species. Here, then, I had at last got a theory by which to work' (*The Life and Letters of Darwin*, by his son, autobiographical chapter, vol. 1). . . . Looking around at the lowest existing types of humanity, and comparing them with the highest, one feels immediately constrained to ask, 'Do we ever fully realize how this advance of which we are so proud, and which is represented by the intellectual social distance between these two extremes, has been brought about? We talk vaguely about it, and take for granted many things in connection with it; but the number of those who have grasped certain elementary biological laws of which it is the result, and which have controlled and directed it as rigidly as the law of gravity controls and directs a body falling to the earth, is surprisingly small. . . .

"At the outset we find man to be in one respect exactly like all the creatures which have come before him. He reproduces his kind from generation to generation. In doing so, he is subject to a law which must never be lost sight of. Left to himself, this high-born creature, whose progress we seem to take for granted, has not the slightest innate tendency to make any onward progress whatever. It may appear strange, but it is strictly true, that if each of us were allowed by the conditions of life to follow his own inclinations, the average of one generation would have no tendency whatever to rise beyond the average of the preceding one, but distinctly the reverse. This is not a peculiarity of man; it has been a law of life from the beginning, and it continues to be a universal law, which we have no power to alter."

As a result of this view, Mr. Kidd believes that to insure progress society must insure the perpetuation of competition. This, he says, is against the immediate interests of the industrially weaker classes, and therefore they are advocating socialism, the essence of which Mr. Kidd finds to consist in the elimination of competition. But Mr. Kidd says this cannot prevail, because it would mean biological deterioration and death. Through all our Western civilization Mr. Kidd finds a process going on born of the superrational sanctions of Christianity, tending to altruism, lifting up the lower classes, by an ever-widening democracy not toward socialism, but toward a condition where all classes can compete on planes of more perfect equality. He says (pp. 154-65):

"The Reformation liberated, as it were, into the practical life of the peoples affected by it that immense body of altruistic feeling which had been from the beginning the distinctive social product of the Christian religion" (p. 154). The clue to modern history, he says, lies "in the fact that it has consisted essentially in the gradual breaking down of the military organization of society which had previously prevailed and in the emancipation and enfranchisement of the great body of the people hitherto universally excluded under that constitution of society from all participation on equal terms in the rivalry of existence. . . . And it tends to culminate in a condition of society in which there shall be no privileged classes, and in which all the excluded people shall be last brought into the rivalry of life on a footing of equality, of opportunity, the significance of the whole process consisting in its tendency to raise the rivalry of existence to the highest degree of efficiency as a cause of progress, to which it has ever attained in the history of life."

Mr. Kidd thus formulates his conclusions as to social reform (pp. 237, 238):

"In the era upon which we are entering, the long, uphill effort to secure equality of opportunity, as well as equality of political rights, will of necessity involve not the restriction of the interference of the State, but the progressive extension of its sphere of action to almost every department of our social life. The movement in the direction of the regulation, control, and restriction of the rights of wealth and capital must be expected to continue, even to the extent of the State itself assuming these rights in cases where it is clearly proved that their retention in private hands must unduly interfere with the rights and opportunities of the body of the people. But the continuity of principle may be expected to remain evident under the new appearances. Even in such cases, the State will, in reality, assume such functions in order to preserve or secure free competition rather than to suspend it. Hence, the general tendency must be expected to be toward State interference and State control, on a greatly extended scale, rather than toward State management. It may, perhaps, be inferred from this that the development of society in the direction indicated will itself be a movement toward socialism. This is not so. The gulf between the state of society—toward which it is the tendency of the process of evolution now in progress to carry us—and socialism is wide and deep. The avowed aim of socialism is to suspend that personal rivalry and competition of life, which not only is now, but has been from the beginning of life, the fundamental impetus behind all progress. The inherent tendency of the process of social development now taking place among us is (as it has been from the beginning of our civilization) to raise this rivalry to the very highest degree of efficiency as a condition of progress, by bringing all the people into it on a footing of equality, and by allowing the freest possible play of forces within the community, and the widest possible opportunities for the development of every individual's faculties and personality. This is the meaning of that evolutionary process which has been slowly proceeding through the history of the Western peoples."

Not Socialism.

Contrary both to Mr. Spencer and to Mr. Kidd are the views of Professor Huxley. Of Mr. Spencer's view, Professor Huxley says (*Administrative Nihilism*, an address delivered to the Midland Institute, October 9, 1871):

"One of the profoundest of living English philosophers, who is at the same time the most thoroughgoing and consistent of the champions of astynocracy, has devoted a very able and ingenious essay to the drawing out of a comparison between the process by which men have advanced from the savage state to the highest civilization, and that by which an animal passes from the condition of an almost shapeless and structureless germ to that in which it exhibits a highly complicated structure and a corresponding diversity of powers. . . . All this appears to be very just. But if the resemblance between the body physiological and the body politic is any indication not only of what the latter is, and how it has become what it is, but of what it ought to be, and what it is tending to become, I cannot but think that the real force of the analogy is totally opposed to the negative view of State function."

"Suppose that, in accordance with this view, each muscle were to maintain that the nervous system had no right to interfere with its contraction, except to prevent it from hindering the contraction of another muscle; or each gland, that it had a right to secrete, so long as its secretion interfered with no other; suppose every separate cell left free to follow its own 'interests,' and *laissez faire* lord of all, what would become of the body physiological?"

"The fact is, that the sovereign power of the body thinks for the physiological organism, acts for it, and rules the individual components with a rod of iron. . . . Hence, if the analogy of the body politic with the body physiological counts for anything, it seems to me to be in favor of a much larger amount of governmental interference than exists at present, or than I, for one, at all desire to see. But, tempting as the opportunity is, I am not disposed to build up any argument in favor of my own case upon this analogy curious, interesting, and in many respects close as it

Huxley Opposed to Spencer's View.

is, for it takes no cognizance of certain profound and essential differences between the physiological and the political bodies."

Professor Huxley then goes on to state his own views, and says:

"When men living in society have once become aware that their welfare depends upon two opposing tendencies of equal importance—the one restraining, the other encouraging, individual freedom—the question, 'What are the functions of government?' is translated into another—namely, What ought we men, in our corporate capacity, to do, not only in the way of restraining that free individuality which is inconsistent with the existence of society, but in encouraging that free individuality which is essential to the evolution of the social organization? The formula which truly defines the function of government must contain the solution of both the problems involved, and not merely of one of them.

"Locke has furnished us with such a formula, in the noblest, and at the same time briefest, statement of the purpose of government known to me:

'THE END OF GOVERNMENT IS THE GOOD OF MANKIND'
(Of Civil Government, § 229).

"But the good of mankind is not a something which is absolute and fixed for all men, whatever their capacities or state of civilization. Doubtless it is possible to imagine a true 'Civitas Dei,' in which every man's moral faculty shall be such as leads him to control all those desires which run counter to the good of mankind, and to cherish only those which conduce to the welfare of society; and in which every man's native intellect shall be sufficiently strong, and his culture sufficiently extensive, to enable him to know what he ought to do and to seek after. And in that blessed state police will be as much a superfluity as every other kind of government.

"But the eye of man has not beheld that state, and is not likely to behold it for some time to come. What we do see, in fact, is that states are made up of a considerable number of the ignorant and foolish, a small proportion of genuine knaves, and a sprinkling of capable and honest men, by whose efforts the former are kept in a reasonable state of guidance, and the latter of repression. And such being the case, I do not see how any limit whatever can be laid down as to the extent to which, under some circumstances, the action of government may be rightfully carried. . . . The question when to draw the line between those things with which the state ought, and those with which it ought not, to interfere, then, is one which must be left to be decided separately for each individual case. The difficulty which meets the statesman is the same as that which meets us all in individual life, in which our abstract rights are generally clear enough, tho it is frequently extremely hard to say at what point it is wise to cease our attempts to enforce them."

Professor Huxley wrote before Mr. Kidd's *Social Evolution* appeared; but among his latest utterances he showed that there was a deep division to be drawn between the biological laws which govern the development of the lower forms of creation and those which govern man. He says (*The Struggle for Existence* in the *Nineteenth Century*, February, 1888, pp. 165, 166):

"Society, like art, is a part of nature. But it is convenient to distinguish those parts of nature in which man plays the part of immediate cause as something apart; and, therefore, society, like art, is usefully to be considered as distinct from nature. It is the more desirable, and even necessary, to make this distinction, since society differs from nature in having a definite moral object; whence it comes about that the course shaped by the ethical man—the member of society or citizen—necessarily runs counter to that which the non-ethical man—the primitive savage, or man as a mere member of the animal kingdom—tends to adopt. The latter fights out the struggle for existence to the bitter end, like any other animal; the former devotes his best energies to the object of setting limits to the struggle.

"The history of civilization—that is, of society, is the record of the attempts which the human race has made to escape from this position (*i.e.*, the struggle for existence in which those who were best fitted to cope with their circumstances, but not the best in any other

sense, survived). The first men who substituted the state of mutual peace for that of mutual war, whatever the motive which impelled them to take that step, created society. But in establishing peace, they obviously put a limit upon the struggle for existence. Between the members of that society, at any rate, it was not to be pursued *à outrance*. And of all the successive shapes which society has taken, that most nearly approaches perfection in which war of individual against individual is most strictly limited."

Professor D. G. Ritchie, in his *Darwinism and Politics*, carries the argument still further, and shows, in the first place, that "the survival of the fittest" does not necessarily mean the survival of the best. He says:

"The phrase 'survival of the fittest' is very apt to mislead, for it suggests the fittest or best in every sense or in the highest sense, whereas it only means, as Professor Huxley has pointed out, 'those best fitted to cope with their circumstances' (article in *The Struggle for Existence*, in *Nineteenth Century*, for February, 1888, p. 165), in order to survive and transmit offspring. Now when we come to consider society, we have to deal with a very complex set of phenomena, and what is fittest in one aspect may not be fittest in another. But natural selection implies no further morality than 'nothing succeeds like success.' If the struggle for food and mates be carried on its lowest terms, the strongest and the strongest only would be selected. But cunning can do a great deal against strength. Now we cannot be sure that a good combination of strength and cunning will be selected: strength in some cases, cunning in others, is what we find by comparing different species of animals and different races of men. Again, the strongest and largest and in many ways finest animals are not necessarily those most capable of adapting themselves to changed circumstances. The insignificant may more easily find food and escape enemies. We cannot be sure that evolution will always lead to what we should regard as the greatest perfection of any species. Degeneration enters in as well as progress. The latest theory about the Aryan race makes the Aryans come from the north of Europe, conquer the feeblar races of the south, and, having proved its fitness in this way, prove its unfitness in another by being less capable of surviving in a warm climate than they; so that an Aryan language may be spoken where there remains little or no Aryan blood. Are we entitled to maintain, with regard to human races and human individuals, that the fittest always survive, except in the sense in which the proposition is a truism, that those survive who are most capable of surviving?"

**"Survival
of the Fit-
test" Not
the Best.**

"Further, we must emphasize the fact that the struggle goes on not merely between individual and individual, but between race and race. The struggle among plants and the lower animals is mainly between members of the same species; and the individual competition between human beings, which is so much admired by Mr. Herbert Spencer, is of this primitive kind. When we come to the struggle between kinds, it is to be noticed that it is fiercest between allied kinds; and so, as has been pointed out, the economic struggle between Great Britain and the United States is fiercer than elsewhere between nations. But so soon as we pass to the struggle between race and race, we find new elements coming in. The race which is fittest to survive, *i.e.*, most capable of surviving, will survive; but it does not therefore follow that the individuals thereby preserved will be the fittest, either in the sense of being those who in a struggle between individual and individual would have survived, or in the sense of being those whom we should regard as the finest specimens of their kind. . . . Admirable, doubtless—this scheme of salvation for the elect by the damnation of the vast majority; but, pray, do not let us hear anything more about its beneficence."

"I am not speaking at random about these ethical applications of the conception of struggle for existence. Darwin himself, as always, is most cautious and guarded in his reference to anything that lies outside his own special sphere of observation. He looks forward to the elimination of the lower races by the higher civilized races throughout the world (*Life and Letters*, I, p. 316). He points out how 'a struggle for existence, consequent on his rapid multiplication,' has advanced man to his present high condition; 'and if he is to advance still higher, it is to be feared that

he must remain subject to a severe struggle. Otherwise he would sink into indolence, and the more gifted men would not be more successful in the battle of life than the less gifted' (*Descent of Man*, p. 319). This, doubtless, includes the old objection which Aristotle brought against Plato's communism, that man needs a stimulus to exertion and industry. But there is no jubilation, no exaltation of a natural law into an ethical ideal. And let us know how Darwin modifies this very statement in the words that follow:

"Important as the struggle for existence has been and even still is, yet as far as the highest part of man's nature is concerned there are other agencies more important. For the moral qualities are advanced, either directly or indirectly, much more through the effects of habit, the reasoning powers, instruction, religion, etc., than through natural selection; tho to this latter agency may be safely attributed the social instincts which afforded the basis for the development of the moral sense."

Socialists, however, usually go farther than any of the above writers, and argue from evolution not only that the struggle for existence is not the only law of human progress, but that it teaches the development and survival of combination over competition. Says a recent writer (anonymously):

"This law of organic evolution does not stop with the development of the physical. It is the same throughout the entire realm of phenomena. It passes over into the immaterial and builds up political, social, and moral institutions in almost precisely the same manner as physical organisms are formed. In the political aspect of the world the start is also had with the individual or unit.

Then follows a community of units, the town, for instance. The same law of development or community of vital interests results in the organization of counties, States and nations, each a political organism, with functions peculiar to its specific plane of being or place in the body politic; but all, when perfected, working harmoniously together for the common good and equal rights of the units, the individual men and women that form the organism or political body. This same law of progressive development also foreshadows the time when there will be a confederacy of nations, a political world organism, a race unity, the highest functions of which will be to secure to the race—unit—man the freedom of a fair chance in the exercise of his inalienable right to preserve and enhance his inherent individuality."

Socialists believe in the evolution of competition. Says W. D. P. Bliss (*Handbook of Socialism*, p. 21):

"Competition was once mainly physical; this produced the survival of the fittest to survive in *physical strife*. 'There were giants in those days,' the Nimrods, the Goliaths, the Agamemnonns, 'kings of men.' Organized society gradually restrained that physical strife, and competition became chiefly military between States. This was the distinguishing feature of the Greek State and of the Roman civilization. It produced an Alexander, a Hannibal, a Caesar, and continued to the time of Napoleon, and is not yet dead. But gradually advancing fraternalism has replaced military by industrial competition. To-day men strive neither with guns nor with poisoned arrows, so much as with cornerings of the market and with poisoned groceries. It has produced the survival of the fittest to survive in such a strife—the Rothschilds, the Jay Goulds, the Vanderbilts, the Pullmans, the Napoleons of finance. Therefore, socialists do not urge the abolition of competition. They simply say that it is time to lift competition to a higher level, and make it intellectual, not industrial. As organized fraternalism has to a large measure put down physical strife, and is putting down militarism, so socialists would have it gradually supplant industrial competition by industrial cooperation."

A recent work, however, on social evolution is Professor S. N. Patton's *Theory of the Social Forces* (January, 1896). He says (p. 7): "Evolution has thus far been studied as a problem of biology. This has been due more to what I

would call a happy accident than to any necessity of the situation. Darwin admits that he obtained the clue to his theory through reading Malthus's *Essay on Population*, and in many respects the attitude of the author of the *Origin of Species* is that of an economist. It is only by later writers that the economic elements in the problem are neglected, and that the theory is based solely upon biologic evidence. The happy accident to which I have referred is the fact that the history of past organic life is so plainly recorded in the various organisms of the present and in the fossil remains of earlier forms."

Professor Patton then goes on to argue that evolution is the result of the action of environment upon organism; that biology has studied organism (because of the "happy accident" that this is what could be best historically studied), but has neglected environment. He quotes Spencer as saying (*Psychology*, vol. i., p. 134): "Throughout biology proper the environment and its correlated phenomena are either but tacitly recognized, or overtly and definitely recognized, are so but occasionally, while the organism and its correlated phenomena practically monopolize the attention." Here Professor Patton finds the weak point in current economic discussions. They have overlooked environment, and, says Professor Patton (p. 5), "the present environment of the race is so different from its predecessors that a new social philosophy is demanded to explain its effects." Hence Professor Patton's essay is "an attempt to recast current social philosophy and to introduce into it elements which thus far have been overlooked." These elements are largely psychologic, and, according to Professor Patton, deserve to rank equally with the biologic factors. By such an analysis of man's present environment Professor Patton forecasts "a social commonwealth," based upon a pure pleasure economy, even as state socialism, according to him, is the ideal of those suffering from the evils of a fair economy. This social commonwealth, however, he says, must not be assumed to be the highest or final state. "If a progressive evolution continues," he tells us (p. 6), "other societies will be possible, each of which will differ from its predecessor as radically as the society I describe differs from our present society."

EXCHANGE, in economic science, may be defined as the giving of one commodity or service for another commodity or service. It lies at the basis of almost all modern production and distribution. Little is produced to-day by one's self for one's self. Without exchange of services and of commodities there could scarcely be production or distribution on any large scale. This is so much so that some have identified all political economy as the science of exchange or catalactics. (See POLITICAL ECONOMY, also CATALACTICS.) Others have proposed to do away with exchange as a separate title or subject, considering it under production and distribution. Most economists make it, however, a distinct and important part of political economy. Adam Smith attributes exchange to the division of labor, and treats it before he considers wages,

profits, or rents (*Wealth of Nations*, book i., chap. iv.). Both James and John Stuart Mill treat it after treating of production and distribution and slight exchange. The latter says: "Exchange and money make no difference in the law of wages, in the law of rent, nor in the law of profit" (*Principles*, book iii., chap. xxvi.). On the other hand, most economists believe wages, rent, and profit are not possible without exchange, and cannot be studied till we understand exchange. Professor Walker puts exchange at least before distribution; and Professors Sedgwick and Marshall treat distribution and exchange as too intimate to be separated.

Under the section "Exchange" (*Political Economy*, Part III., revised edition), Professor Walker says:

"Under the title 'Exchange' in a systematic treatise on political economy, I would consider the ratios of exchange, the terms on which goods, commodities, articles possessing value, items in the sum of wealth exchange for one another. Why does so much of this commodity exchange for so much of that?" It is obvious that this raises the whole question to-day so much mooted of value. It will, therefore, in this encyclopedia best be treated under the head VALUE (*q. v.*).

EXCHANGE, FOREIGN. See FOREIGN EXCHANGE.

EXCHANGE, STOCK. See STOCK EXCHANGE.

EXCHANGE VALUE. See VALUE.

EXCISE (from Lat. *ex-cide*, cut off) is a duty laid upon any commodity produced within a country in distinction from those custom duties (see **TARIFF**) which are levied upon imports. The derivation implies that the excise is something cut off from the price for the benefit of the state. It is an indirect tax, because, tho levied on the product, it falls on the consumer. Excise duties are an old form of duty, begun in England under this name as early as 1643, being laid on ale and all forms of intoxicating drinks, and later on a long list of articles of food and clothing. The necessities of life were later excepted. Excise duties were at first duties on commodities produced in or out of a country. Robert Walpole, in 1733, introduced a famous excise scheme, whereby tobacco and, later,

wine paid no duty, but was warehoused under the control of excise officers, and paid excise duties only as sold within the country. It produced a great excitement, and was abandoned. To-day excise duties are paid in England on beer, wine, spirits, tobacco, dogs, gun and game licenses, carriages, male servants, armorial bearings, railway tickets, by auctioneers, peddlers, farm brokers, tavern-keepers, etc.

In the United States, excise duties were disliked as inheritances from the English Government, and an effort was early made to enact a constitutional amendment forbidding excise duties; but in 1790 Hamilton proposed and got passed an excise duty on spirits. In 1792 it was lowered, and under Jefferson abolished. The War of 1812 led to an excise duty on distilled spirits, domestic refined sugar, salt, carriages, etc. But in 1817 these were abolished, and no excise duty was levied till the internal tax of 1862. (See **INTERNAL REVENUE**.) The excise duties in Great Britain for the fiscal year ending March 31, 1895, were \$129,378,130. The internal revenue of the United States in 1895 was \$143,421,672. (For a discussion of excise duties, see **TAXATION**.)

EXECUTIVE. See **PRESIDENT**; **SOVEREIGN**, etc.

EXPENDITURES (FAMILY).—According to the well-known laws formulated by Dr. Engels, head of the Prussian Royal Bureau of the Statistics of Labor, expenditures in different families conform to the following principles:

1. That the greater the income, the smaller the relative percentage of outlay for subsistence.
2. That the percentage of outlay for clothing is approximately the same, whatever the income.
3. That the percentage of the outlay for lodging or rent, and for fuel and light, is invariably the same, whatever the income.
4. That as the income increases in amount the percentage of outlay for sundries becomes greater.

These principles seem in the main substantiated by the most careful investigation.* The most extensive investigation thus far made is probably that reported by the United States Commissioner of Labor for 1891, the result of which we condense here. It is based on investigations in the iron, coal, glass, cotton and woolen industries. The following tables are abridged from the report (vol. ii., pp. 864, 865):

PERCENTAGE OF EXPENDITURES IN NORMAL FAMILIES.

OBJECTS OF EXPENDITURE.	INCOME UNDER \$200.		INCOME, \$200-\$300.		INCOME, \$500-\$600.		INCOME, \$900-\$1,000.		INCOME ALL SIZES.	
	Europe.	United States.	Europe.	United States.	Europe.	United States.	Europe.	United States.	Europe.	United States.
Rent	9.38	15.48	12.05	14.65	10.26	15.15	10.49	14.06	11.29	15.05
Fuel	5.38	7.07	5.62	6.59	3.32	5.63	5.19	4.00	4.88	5.01
Lighting	1.66	1.01	1.68	1.06	1.37	.97	1.53	.74	1.54	.90
Clothing	19.08	12.82	14.16	14.33	15.21	15.27	14.15	16.84	15.00	15.31
Food	48.32	49.64	49.62	44.26	50.06	43.84	46.24	34.34	48.78	41.05
Other Purposes	16.18	13.98	16.87	19.21	19.78	19.14	22.40	29.12	18.51	22.68

* Dr. Engels is now publishing a series of studies on the family budgets of all countries.

Expenditures (Family).

Expenditures (Family).

The following gives comparisons for different countries for the above industries :

COUNTRIES.	Income.	AVERAGE EXPENDITURES.			
		Rent.	Fuel.	Food.	Other.
United States.....	\$657.39	\$76.03	\$26.67	\$250.62	\$305
Great Britain.....	502.76	47.21	20.47	232.61	202
France.....	413.80	32.99	13.44	182.21	185
Belgium.....	433.27	29.93	15.99	200.64	187
Germany.....	320.02	27.07	10.59	168.82	123
Switzerland.....	358.56	25.44	23.48	179.28	130

COUNTRIES.	CLOTHING.			Taxes.	Insurance.	SOCIETIES.	
	Husband.	Wife.	Children.			Labor.	Other.
United States.....	\$33.68	\$23.72	\$54.83	\$7.37	\$24.84	\$7.33	\$8.64
Great Britain.....	22.15	20.50	37.94	8.44	15.60	7.34	7.93
France.....	29.49	14.76	38.35	2.47	4.34	3.79	3.78
Belgium.....	23.98	12.38	48.25	4.69	2.75	3.23	5.68
Germany.....	20.04	11.20	25.88	3.54	10.34	1.30	3.15
Switzerland.....	22.68	11.78	30.92	2.07	8.89	.39	3.35

COUNTRIES.	Amusements and Vacations.	Intoxicating Liquors.	Tobacco.	Books and Newspapers.	Religion.	Charity.
United States.....	\$13.38	\$22.82	\$10.66	\$6.41	\$7.99	\$3.93
Great Britain.....	23.55	23.22	11.43	4.95	6.74	3.08
France.....	13.38	31.84	6.60	3.35	3.00	3.47
Belgium.....	17.43	25.77	6.20	2.33	0.96	1.83
Germany.....	7.97	12.50	3.87	2.11	1.17	0.78
Switzerland.....	20.57	15.97	3.25	1.77	1.76

These statistics for the United States are based on the expenditures of 487 families in the pig iron industry, 203 in the bar iron, 70 in the steel, 309 in the bituminous coal, 104 in the coke, 66 in the iron ore, 639 in the cotton, 323 in the woolen, 773 in the glass. Each industry was averaged separately, and the above averages are the average of the industry averages.

For Great Britain, the statistics are based on the expenditures of 39 families in the pig iron industry, 73 in the bar iron, 72 in the steel, 137 in the bituminous coal, 11 in the coke, 164 in the cotton, 59 in the wool, and 22

in the glass. For France: 40 in the bar iron, 61 in the cotton, 128 in the wool. For Belgium: 71 in the pig iron, 45 in the bar iron, 9 in the bituminous coal, 4 in the coke, 24 in the glass. For Germany: 22 in the bar iron, 35 in the steel, 16 in the bituminous coal, 10 in the coke, 37 in the iron ore, 70 in the cotton, 23 in the woolen. For Switzerland: 46 in the cotton industry.

The following tables, taken from various earlier investigations in Massachusetts, Illinois, and Great Britain, and quoted in the above-mentioned United States report, confirm the same general results.

MASSACHUSETTS.—PERCENTAGES OF EXPENDITURES.—AMOUNT, \$754.42.

ITEMS OF EXPENDITURE.	Massachusetts Budgets, 1883.	Engel's Prussian Law.	Massachusetts Bureau Table, 1875.	Average.
Subsistence.....	\$49.28	\$50.00	\$56.00	\$51.76
Clothing.....	15.95	18.00	15.00	16.32
Rent.....	19.74	12.00	17.25	16.25
Fuel.....	4.30	5.00	6.00	5.10
Sundry expenses.....	10.73	15.00	6.00	10.57
Totals.....	\$100.00	\$100.00	\$100.00	\$100.00

COMPARATIVE PERCENTAGES OF EXPENDITURES BY THE FAMILIES OF WORKING MEN IN ILLINOIS, MASSACHUSETTS, GREAT BRITAIN, AND PRUSSIA.

ITEMS.	Illinois.	Massachusetts.	Great Britain.	Prussia.*	Average.
Subsistence.....	\$41.38	\$49.28	\$51.36	\$55.00	\$49.25
Clothing.....	21.00	15.05	18.12	18.00	18.27
Rent.....	17.42	19.74	13.48	12.00	15.66
Fuel.....	5.63	4.30	3.50	5.00	4.61
Sundries.....	14.57	10.73	13.54	10.00	12.21
Totals.....	\$100.00	\$100.00	\$100.00	\$100.00	\$100.00

* It is to be noted that for Prussia a family of the intermediate class is taken.

EXPORTS AND IMPORTS.—We devote this article exclusively to statistics of the exports and imports of the United States and Great Britain. (For a discussion of the principles involved, see COMMERCE; FREE TRADE; PROTECTION; VALUE, etc.)

THE UNITED STATES.

According to the Statistical Abstract of the United States for 1895, p. 83, the merchandise imported and exported, and the annual excess of imports or of exports from 1845 to 1895 in specie values were as follows:

YEAR ENDING JUNE 30.	EXPORTS.		Imports.	Excess of Imports over Exports.
	Domestic.	Foreign.		
1845.....	\$9,455,330	\$7,584,781	\$13,184,322	\$7,144,211

1885.....	726,682,946	15,506,809	577,527,329	— 164,662,426
1886.....	665,064,529	13,560,301	635,436,136	— 44,888,694
1887.....	703,224,923	12,100,288	602,319,768	— 23,863,443
1888.....	783,862,104	12,092,423	723,957,114	28,002,607
1889.....	639,282,600	11,182,766	745,131,652	— 2,730,277
1890.....	845,293,828	12,534,856	789,310,409	— 68,158,275
1891.....	872,297,283	12,100,527	844,166,196	— 39,564,614
1892.....	1,015,733,011	15,546,137	827,402,462	— 202,875,686
1893.....	831,030,785	16,430,490	866,400,922	— 18,737,728
1894.....	869,204,937	22,935,635	654,994,622	— 237,145,959
1895.....	793,392,599	14,145,566	731,969,605	— 75,568,200

The minus sign (—) before the amount indicates excess of exports over imports.

According to the same authority, the values of domestic merchandise, grouped according to sources of production, exported during 1860, 1870, and from 1875 to 1895, were as follows:

YEAR ENDING JUNE 30.	EXPORTS OF DOMESTIC MERCHANDISE OTHER THAN MANUFACTURES.*						EXPORTS OF DOMESTIC MANUFACTURES.	
	AGRICULTURE.		MINING.	FOREST.	FISHERIES.	MISCELLANEOUS.	Values.	Per Cent.

* The group "Other than manufactures" embraces substantially all articles crude or slightly enhanced in value by manufacture.

Note 1. For the kinds of articles embraced in the respective groups, see Appendix to the Annual Report on Commerce and Navigation, 1893, p. cxxx.

Note 2. The values of exports of products of domestic agriculture from the United States for decennial fiscal years prior to 1860 were as follows: 1820, \$1,657,673, or 81 per cent.; 1830, \$48,905,184, or 82 per cent.; 1840, \$92,548,067, or 83 per cent.; 1850, \$108,605,713, or 81 per cent. of all exports of merchandise.

The value of some main exports for the different years ending June 30 are :

	1889.	1890.	1891.	1892.	1893.	1894.	1895.
Raw cotton.....	4,872,060	5,020,913	5,820,779	5,891,411	4,431,220	5,397,509	6,965,358
Wheat	46,414,129	54,387,767	55,131,948	57,280,351	117,121,109	88,415,230	76,102,704

GREAT BRITAIN.

According to the *Statesman's Year Book* for various years, the declared value of the imports and exports of merchandise of the United Kingdom was as follows, together with the imports and exports to and from the most important countries, and the values of the most important articles. One half the value of the British and Irish products exported consists of textiles. The imports consist mainly of articles of food and raw cotton, and are almost twice the exports of British produce.

It is interesting to note the large amount of imports from the United States, altho the value seems to have decreased during the past few years.

YEAR.	Total Imports.	Exports of British Produce.	Exports of Foreign and Colonial Produce.
1884.....	£390,018,569	£233,025,242	£62,942,341
1885.....	379,967,955	213,115,114	58,359,194
1886.....	349,863,472	212,725,200	56,234,263
1887.....	362,227,504	221,913,910	59,348,975

F.

FABIAN SOCIETY, THE (AMERICAN).—A movement to establish in America a Fabian Society and carry on a work like that of the Fabian Society in England (see the next article) was commenced in Boston in February, 1895, under the lead of the Rev. W. D. P. Bliss. Similar beginnings were made almost simultaneously in California and Washington under the influence of Mr. Lawrence Gronlund. A monthly has been established in Boston, *The American Fabian* (now published in New York); a few tracts have been published, and branches started in Boston, New York, Philadelphia, Madison, Wis., San Francisco, Seattle, Wash., and a few other places. As yet, however, little definite organization has been reached.

FABIAN SOCIETY, THE (ENGLISH).—The Fabian Society is an organization of English socialists, formed in London in 1883, and to-day one of the most influential economic and political societies in England. Its basis of organization is as follows:

"The Fabian Society consists of socialists.

"It therefore aims at the reorganization of society by the emancipation of land and industrial capital from individual and class ownership, and the vesting of them in the community for the general benefit. In

this way only can the natural and acquired advantages of the country be equitably shared by the whole people.

"The society accordingly works for the extinction of private property in land and of the consequent individual appropriation, in the form of rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites.

"The society, further, works for the transfer to the community of the administration of such industrial capital as can conveniently be managed socially. For, owing to the monopoly of the means of production in the past, industrial inventions and the transformation of surplus income into capital have mainly enriched the proprietary class, the worker being now dependent on that class for leave to earn a living.

"If these measures be carried out, without compensation (though not without such relief to expropriated individuals as may seem fit to the community), rent and interest will be added to the reward of labor, the idle class now living on the labor of others will necessarily disappear, and practical equality of opportunity will be maintained by the spontaneous action of economic forces with much less interference with personal liberty than the present system entails.

"For the attainment of these ends the Fabian Society looks to the spread of socialist opinions, and the social and political changes consequent thereon. It seeks to promote these by the general dissemination of knowledge as to the relation between the individual and society in its economic, ethical, and political aspects.

"The work of the Fabian Society takes, at present, the following forms:

"1. Meetings for the discussion of questions connected with socialism.

"2. The further investigation of economic problems, and the collection of facts contributing to their elucidation.

"3. The issue of publications containing information on social questions, and arguments relating to socialism.

"4. The promotion of socialist lectures and debates in other societies and clubs.

"5. The representation of the society in public conferences and discussions on social questions.

"The members are divided into local groups, are pledged to take part according to their abilities and opportunities in the general work of the society, especially as regards their own localities, and altho there is no compulsory subscription, are expected to contribute annually to the society's funds. The amount of each member's subscription is known only to the Executive Committee.

"The society seeks recruits from all ranks, believing that not only those who suffer from the present system, but also many who are themselves enriched by it, recognise its evils and would welcome a remedy.

"The society meets for lectures and discussions on two Fridays in the month, at 8 P.M."

The society attaches small importance to mere numerical growth. Its rules of membership are quite strict.

Candidates resident within the area of the London groups must sign a declaration that they accept the basis of the society, must attend two meetings as visitors, and must be proposed and seconded by members from personal knowledge. The names of all candidates must be printed in the *Fabian News* every month, and they shall not be elected before the second meeting of the Executive Committee after such publication. The proposer and seconder must sign the nomination paper, and must each forward a letter to the Secretary stating that the candidate is a socialist, and likely to be a useful member of the society. Candidates shall be elected by an unanimous vote of the Executive Committee. If a candidate be rejected his proposer shall have a right of appeal to the society, in which case a ballot shall be taken at a private meeting, with due notice given, when one black ball in five shall exclude.

Candidates who cannot qualify by attending the public meetings of the society may attend meetings of the group in whose area they reside, and on the recommendation of the Secretary of the group, two such attendances shall be deemed to qualify.

Every candidate for election shall make a contribution to the funds of the society prior to his election, the amount being returned to him if he is not elected.

The Executive Committee may by an unanimous vote, for special reasons, suspend such parts of this rule as specify qualifications for membership, except that part which requires acceptance of the basis.

Nevertheless, the growth in membership has been steady. Its present membership is as follows :

Number of members in London groups.....	374
Number of members elsewhere.....	365
Total number.....	739

Fabian societies exist outside of England in South Australia, Victoria, Ireland, Scotland, Canada, and the United States. (See previous article.) The secret

Fabian Societies. of success has been its steady work, led by a half dozen of its original members, men of unusual ability, who are now becoming known throughout England, and who have steadily worked together from the first. Says its efficient secretary, Mr. Edward R. Pease :

"The society has never attempted to form itself into a political party. It has never sought a large membership, or contemplated running candidates of its own. It has adopted the general rule that it is cheaper and more effective to write for the public press than to publish an organ of its own; to lecture to Radical clubs rather than to Fabian branch meetings; to write programs for Liberal associations rather than to create a new organization for itself. In one recent year 119 members reported over 3300 lectures delivered almost entirely to outside bodies."

Its educational work, however, has by no means been confined to writings. It has published over 60 tracts, many of them having a very large sale. The society sold in 1894-95 80,376 tracts at a penny or over, and literature amounting in all to \$1400. The great literary success of the society, however, has been its *Fabian Essays*. In 1889 a course of seven lectures, which had been previously delivered before the society by members of the society (George Bernard Shaw, Sidney Webb, William Clarke, S. Olivier, Graham Wallas, Annie Besant, and Hubert Bland) was published under the name of *Fabian Essays in Socialism*, and met with most marked success. Over 30,000 copies have been sold in England, and two American editions have appeared.

Method of Propaganda. The tracts are accurate and concise statements of industrial facts or explanations of the application of the principles of socialism to actual and existing political and social problems. They have treated such subjects as *Facts for Socialists* ; *Why are the Many Poor ? Facts for Londoners* ; *The Worker's Political Program* ; *What Socialism Is* ; *An Eight-Hour Bill* ; *English Progress toward Social Democracy* ; *Land Nationalization* ; *A Labor Policy for Public Authorities* ; *Christian Socialism*. One of the most valuable is *What to Read : a List of Books for Social Reformers*. It includes all the best books on economics, socialism, labor movements, poverty, etc., with suggested courses of reading.

The society publishes a little monthly record entitled *The Fabian News*, confined mainly to news of the society itself.

Its political work has been as important as its educational.

In 1888 the *Star* evening newspaper was started, and, adopting Fabian ideas, became at once an enormous success. In 1889 the people of London elected their first County Council, and, to the surprise of everybody, the Progressive majority proved to be socialist in all its leading ideas.

In 1890 an active lecturing campaign was started in the country districts by Sidney Webb, Bernard Shaw, Graham Wallas, William Clarke, Hubert Bland, and others, and in a short time nearly every large town in the country had formed a local Fabian Society affiliated with the London body.

In 1892 the second London County Council election was fought on the *London Programme*, written by Sidney Webb, and again the Progressives secured an overwhelming victory, in which every Fabian who ran as a Progressive was elected. In national politics the society has not yet accomplished much. The efforts of Fabians and others to "permeate" the Liberal leaders with collectivism have been more successful in name than in reality. A recent move of the Fabians was a manifesto published in the *Fortnightly Review* for November, 1893, pointing out the failure of the Liberal ministry to redeem its pledges, especially in matters of administration, and calling on the great trade-unions to run their own candidates at the next election. In the recent election of the County Council in 1894, in spite of the Conservative reaction,

all the Fabian Progressive candidates were still successful. Speaking generally, it is probably not too much to say that the phenomenal spread of socialism in England is largely due, as far as propaganda goes, to the work of the Fabian Society. Its lectures have been given wherever an opportunity appeared before all classes, but very largely before London's working men's clubs. Ten years ago these clubs stood mainly for radical, unthinking individualism. Boasting of their individual freedom, even when they were really slaves, the members were more busy with denouncing Christianity than in working for reform. To-day both radicalism and orthodoxy in religion are little talked of, and the clubs are largely political clubs, working on socialist lines. This change has been brought about mainly by the Fabian Society. It may be of interest to Americans to know that the society took its impetus from an interest in social problems occasioned by the lectures of Henry George in England, and the reading of *Progress and Poverty*, and that its founders were first brought together by Professor Thomas Davidson, of New York. The company gathered by Professor Davidson divided into two groups, one founding the ethical movement of the New Fellowship, the other the political and economic Fabian Society.

The name of the society originated in the motto, "For the right moment you must wait, as Fabius did, most patiently, when warring against Hannibal, though many censured his delays; but when the time comes you must strike hard, as Fabius did, or your waiting will be in vain and fruitless."

"Fabian Socialism" does not differ from any other socialism in its aims, but in its economic analysis follows the theory of value (*q.v.*) held by Jevons rather than that inherited by Karl Marx and the German socialists from Adam Smith and Ricardo. In propaganda, Fabians usually follow a progressive policy of advancing their principles through any party where an opening may be found. The address of the Secretary is Edward R. Pease, 276 Strand, London, W. C.

FACTORY LEGISLATION.—The body of laws which has come into existence since the opening of the present century relating to the regulation of factories, workshops, and all places where industry is carried on, comes under the general title of "factory legislation," and it has stamped itself most emphatically upon the written law of all countries where the factory system has taken root, and also upon the social and moral laws which lie at the bottom of the forces which make written law what it is. The establishment of the factory system of labor, resulting in the congregation of large bodies of people working in the same branches of labor, called attention to industrial conditions, and while prior to the establishment of the factory system industrial conditions were apparently much worse than after its establishment, the workers under the old system were so distributed that their surroundings did not attract public attention, or, at least, the attention of legislators; but when great bodies were brought under one roof or into one community,

whatever evils existed became noticeable, and the attention of the legislator was called to them. The factory system was first instituted in England. At the time there were few laws relating to master and man upon the statute-books of England, and those which did exist bore mostly **In England**, upon criminal matters. There was one law, however, in force which had been considered by many as an obstruction to advancement in the mechanic arts, but which, with the establishment of the factory system, was to become the only point upon which labor legislation could turn. This old law was known as "The Apprenticeship Act," and was passed in 1562, during the reign of Elizabeth. It is to be found in 5 Elizabeth, c. 4. It provided that no one should work in certain trades as journeyman until after an apprenticeship of seven years. It was under this act that the custom of apprenticing pauper children by parish officers grew up, and under it there grew also the very worst practices, for the act allowed apprentices to be worked from 5 A.M. until between 7 and 8 P.M., from March to September, and, as the law expresses it, from September to March, from the "spring of the day until the night closed in." When the first cotton factories were erected in England, necessarily where water-courses were found sufficient to supply power, they became so numerous in such localities that the supply of children from the immediate neighborhoods was found to fall far short of the demand. The reverse of this condition prevailed in the agricultural counties, where general misery existed on every hand. The unprincipled poor-law guardians in the latter counties, being anxious to rid their parishes as speedily as possible of pauper children, were very eager to meet the requirements of the industrial communities where the factory system had been established for cheap labor. Children were, therefore, transferred in large numbers to the North, where they were housed in pent-up buildings adjoining the factories, and were kept to long hours of labor. These primary facts soon drew attention to the evils of the factory system as they appeared at its inception, and for the first time the consequences of congregated labor were made clearly apparent. A generation of operatives was growing up under conditions of comparative physical degeneracy, of mental ignorance, and of moral corruption; and it was then that the great questions began to be asked, Has the nation any right to interfere? Shall society suffer that individuals may profit? Shall the next and succeeding generations be weakened morally and intellectually that estates may be enlarged? These great questions forced themselves upon the public mind, and the fact that pauper apprenticeship might be better off under such apprenticeship than in the workhouse had no great weight under the influence of the religious and moral waves which affected England in the last quarter of the last century. **The Nineteenth Century.** The first man to ask such powerful questions of Parliament was Sir Robert Peel, in the year 1802. Sir Robert was a master manufacturer, to whom

the new system of labor had brought wealth and power and station, but he sought to remedy the evils which he knew, from his own personal experience, had grown with the factory system ; so in 1802 he introduced a bill, the object of which was to interfere by law with the natural tendencies of unrestricted competition in the labor of human beings ; but he could not, under the sentiment of the English legislature that precedent must be sacred, go very far beyond the regulation of the labor of parish apprentices. His bill was therefore entitled "An act for the preservation of the health and morals of apprentices and others employed in the cotton and other mills and in cotton and other factories." The whole notion of Peel's measure was that as apprentices were already under statutory provisions, and were subjects of a legal contract, it was permissible that their hours of labor should be regulated by positive enactment ; but Parliament, which was familiar with restrictions on the products of labor, and with restrictions of monopoly on labor itself, would not listen to any proposal to regulate what was called "free" labor for the purpose of avoiding even the most frightful moral evils. In the case of apprentices, however, it was conceded that restriction might be tolerated. Such a concession came under the power of precedent, and the act of 1562, which had theretofore been an obstacle, became the very legal precedent the law-makers of England must have before they could consent to protect human rights, and as that law had regulated the hours of labor of apprentices, Parliament crept through this narrow door, and allowed Sir Robert Peel's bill to restrict the hours of labor of parish apprentices at work in the factories ; and so the first factory act known in legislation was passed. This act is known as 42 and 43, George III., cap. 73, and while it was of no great value to the operatives themselves, it has been of the greatest value to the world, for it made the assertion, which has never yet been retracted, that the nation did have the right to check not only open evils, but those which grow individually through the nature of employment. It dealt simply with the unregulated employment of apprentices. By the provisions of the law the employer was compelled to clothe his apprentices, whose work was limited then to twelve hours a day, night work being prohibited. Every apprentice was to receive daily instruction during the first four years of his time, school attendance to be reckoned as working time. There were many other regulations embodied in the act, stimulated by Sir Robert Peel. The law was substantially repealed in 1814, but in 1815 Sir Robert Peel came back to Parliament, told it that the act of 1802 "had become useless, that apprentices had been given up, but that the same exhausting conditions, from which Parliament had intended to relieve apprentices, was the lot of thousands and thousands of the children of the free poor," and in the following year (1816) Parliament instituted a great inquiry into the condition of the factory population, tho it did not enact a new law until 1819. Under this act the right of the nation to limit the age at which children might be admitted to the

Progress.

factories was established. From 1816 to the present time there has been no cessation in the attempts to regulate by law some of the conditions of labor ; and in all countries where the factory system has taken any hold, as already stated, factory acts are to be found. Such legislation has had for its chief object the regulation of the labor of women and children, but its scope has been constantly enlarged by successive and progressive amendments until law has attempted to secure the physical and moral well-being of the working man in all trades and to give him every condition of salubrity and of personal safety in the workshops.

The most elaborate code of factory laws is that of Great Britain, the present act being a consolidation of all the acts since Sir Robert Peel's law of 1802. In that country the law makes provision for sanitary conditions, for safety from accidents occurring from machinery, regulating employment and meal hours and the employment of young persons and women and children, providing for holidays, for the education of children, for certificates of fitness for employment, regulating overtime and night work, and embodying a great many minor provisions, all looking to the well-being of the operative.

Present English Law.

In France, the factory laws relate to the hours of labor and regulate some of the conditions. Female labor under ground is forbidden, and boys below the age of 16 are not allowed in such work.

Germany has a fair factory code, and is now in the experimental years of a great system of legal and compulsory insurance of work people, the results of which the empire and the governments of other continental countries are watching with great interest.

In this country nearly every State in which textile factories are found has factory laws of some kind, and many of them provide, as does Great Britain, a body of factory inspectors for the enforcement of legislation. Several of our States have regulated the age at which children can be employed in any manufacturing, mechanical or mercantile establishment, for the attendance upon schools, and such matters ; and they are following rapidly in the footsteps of Great Britain in providing that proprietors of factories shall make specific provision against accidents from dangerous machinery, providing penalties for the cleaning of machinery while running, etc. ; and also providing that factories shall be well ventilated and kept clean ; that hoistways, hatchways, elevators, and well-holes shall be protected by good and sufficient trap-doors or other appliances ; that establishments of certain height shall be provided with sufficient fire-escapes, practically constructed, and that they shall be kept in good repair and free from obstruction. Factory acts, varying in their provisions, have been placed upon the statute-books of nearly every State of the Union. To summarize these into a digest would require a volume by itself, but the principles involved in the factory legislation are those indicated, and they relate to the personal well-being and the safety

The United States.

of the operatives employed. The effect of the laws everywhere has been to elevate the standard of employment, to improve the health and increase the longevity of operatives, to reduce their hours of labor from 13 or 14 per day to 9 or 10, and to surround them with good sanitary, healthful conditions. Very many factory and workshop people in different countries find themselves in better surroundings, as to air and general sanitary conditions, while at work than in their homes. The improvement in the moral tone has been sufficient to warrant the existence of factory legislation, but the constant elimination of children from factory labor is one of its most beneficial results.

The student of factory legislation should examine, *History of the Factory System*, by R. Whateley Cooke Taylor; a Report on the Factory System, in Vol. II. of the Reports of the Tenth Census, and *Labor Laws of the United States and Territories*, United States Department of Labor, 1892. *The Reign of Law*, by the Duke of Argyle, is also a work dealing with the subject from a philosophical point of view, and should be carefully studied.

CARROLL D. WRIGHT.

For further consideration of factories, see MACHINERY; FACTORY SYSTEM; LABOR LEGISLATION. The *Political Science Quarterly* publishes annual summaries of the industrial legislation of each year. The laws are, however, so continually modified and added to, and in the United States are so various in various

States that it is impossible to give any accurate detailed statements concerning either the whole country or any general period. The questions of the short-hour movement (*q.v.*) and of arbitration are, perhaps, the factory questions most mooted to day in the United States. In England, the question of a living wage is added. Some believe that the industrial question of the day is rather one of a market than of factory legislation—at least the capability of the factories to produce seems to exceed the capability of the people to “consume,” *i.e.*, to buy. As the people unquestionably want more goods, their inability to consume means a lack of money or faulty distribution. The factories may not be the main places of faulty distribution, but, so far as they are concerned, higher wages are the main need in order to produce better distribution. It is questionable, however, if this can be effected or even materially influenced by legislation, at least by factory legislation. Whatever will improve the general market will undoubtedly be the best aid to-day to factory employers and employees. In many factories to-day the tendency is not to short hours, but to short time. Factories run at rapid speed and during long hours per day, are often shut half the week or for weeks together. But this is rather a general industrial problem than a factory question. See OVERPRODUCTION.

Mr. Hobson, in his *Evolution of Modern Capitalism*, pp. 322, 323, gives the following convenient summary of the leading points in the development of factory legislation in England:

DATE.	Industries Affected.	Class of Workers Chiefly Protected.	Nature of Regulations.	Mode of Administration.	Effectiveness.
1802	Cotton and "other mills" (applied exclusively to cotton).	Apprenticed pauper children.	12 hours day. Night-work regulated. Education, sanitation.	Local justices to appoint visitors.	Virtually inoperative.
1819 } 1820 }	Do. Do.	Children (not paupers).	Prohibition of work under 9 years. Young persons (under 16) a 12-hour day. Regulation for meal-time. Amendment of 1802 Act.	Do.	Do.
1825	Do.	Do	Shortened Saturday labor. Penalties provided for breach of factory regulations.	Do. (Millowners and relatives prevented from acting on the Bench in reference to factory acts.)	Generally evaded.
1833 } 1834 }	All textile industries.	Children and young persons.	48 hours week for children (9-13), 69 hours for young persons (13-18). Prohibits night-work for young persons. Children in silk mills, 10 hours day.	Government inspectors (4).	1 out of every 11 millowners convicted in 1834, in spite of defiant attitude of magistrates.
1842	Mines.	Children and women.	No underground work.	Mine inspectors.	
1844 } to } 1846 }	Printworks.	Children, young persons, women.	Factory acts applied. "False relay" system for children checked. 6½ hours day for children. Female young persons age raised to 21. 12 hours day for women. No night-work for women.	Government inspectors.	Improved administration, but "false relay" system reestablished. Fines inadequate.
1847 } to } 1850 }	Textile factories, printworks, etc.	Do.	10 hours day, afterward 10½ hours day for young persons and women, practically for men.	Increased staff of Government inspectors.	Largely defied or evaded for some time.
1860	Bleaching and dyeing.	Do.	Do., with special regulations for overtime.		
1860	Coal and iron mines.	All workers.	Restriction on male labor under 12. Safety, ventilation, etc.	Mine inspectors.	

DATE.	Industries Affected.	Class of Workers Chiefly Protected.	Nature of Regulations.	Mode of Administration.	Effectiveness.
1863	Finishing processes in bleaching and dyeing, bakehouses, alkali works.	Children, young persons, women.			
1864	Non-textile factories (earthenware, fustian cutting, cartridges, lucifer matches, paper-staining).	Do.	Factory acts generally applied.		
1867	All factories and workshops.	Do.	Factory Acts Extension Act. Workshops Regulation Act, applying to workshops. Factory rules affecting hours, education, etc., in modified form.	Workshops Act left at first to local authorities, brought under factory inspectors, 1871.	Workshops Act dead letter in 1868-69. Later, fines inadequate. Inspectors inadequate.
1867	Agriculture.	Children, women.	Act for Suppression of Agricultural Gangs fixing minimum age at 3, regulating employment of women.		
1870	Print works, bleaching, dyeing.	Children, young persons, women.	Application of chief provisions of 1867 Factory Act.		
1871	Brickworks and fields.	Children and young female persons.	Forbids employment. Improved conditions for women.		
1873	Agriculture.	Children.	Minimum age raised to 10.		
1878	Factories, workshops, agriculture.	Children, young persons, women, (incidentally men).	Consolidation of Factories and Workshops Act (extending some provisions to agriculture).	Increased staff of inspectors.	
1891	Do.	Do.	Amendment of Factories and Workshops Act. Age for children raised to 11. Protection in dangerous trades.	Board of Trade power to schedule dangerous trades.	
1892	Shops.	Children, young persons.	Limits working-day.		
1893	Various trades.	All workers.	Restrictions on dangerous trades.	Appointment of working men and women inspectors. Increased number of inspectors.	
1893	Railways.	Adult males.	Restrictions on hours of labor.		

(For the details of American factory laws, see LABOR LEGISLATION.)

FACTORY SYSTEM, THE.—Altho what is called "the factory system" is a product mainly of the close of the eighteenth century, and of the application of machinery and steam power to industry, factories existed in Greece and Rome and in the older civilizations of Egypt, Assyria, India, and China. In the later Middle Ages they developed in all the industrial cities in connection with the guilds (*q.v.*). In the Elizabethan age they are said to have multiplied in England. But these establishments were not factories in the modern sense. In ancient civilizations they were slave shops, where the slaves worked under a taskmaster; in medieval days they were shops where the master workman labored with his apprentices and his journeymen.

The first factory in the modern sense seems to have been a silk factory, built by Sir Thomas Lombe, in Derbyshire, in 1719. Through all the eighteenth century factories multiplied in England as industries became localized in certain localities or sections. The main cause, however, of the development of the present factory system was, of course, the invention of

machines and the application of steam power in production, necessitating the carrying on of industry in buildings especially adapted to the purpose and in connection with an ever-increasing plant. A realization of what a change this meant in production can be seen by the following picture of the woolen trade before the development of the factory system.

"The work was entirely domestic, and its different branches widely scattered over the country. First, the manufacturer had to travel on horseback to purchase his raw material among the farmers, or at the great fairs held in those old towns that had formerly been the exclusive markets, or, as they were called, 'staples' of wool. The wool, safely received, was handed over to the sorters, who rigorously applied their gauge of required length of staple and mercilessly chopped off by shears or hatchet what did not reach the standard as wool fit for the clothing trade. The long wool thus passed into the hands of the combers, and, having been brought back to them into the combed state, was again carefully packed and strapped on the back of the sturdy horse, to be taken into the country to be spun. . . . Here, in each village, he had his agents, who received the wool, distributed it among the peasantry and received it back as yarn. The machine employed was still the old one-thread wheel, and in summer weather on many a village green might be seen the housewives plying their busy trade, and furnishing to the poet the vision of contentment spinning at the cottage-door. Returning in safety with his yarn, the manufacturer had now to seek out his weavers, who ultimately delivered to him

his camblets or russels, or serges, or tammies or calimancoes (such were the leading names of the fibers) ready for sale to the merchant or delivery to the dyer" (James, *History of the Worsted Manufacture*, p. 323 [quoted by R. Whately Cooke Taylor], *The Modern Factory System*, pp. 61, 62).

With the use of machinery this was all changed. All the processes were gradually brought together in factories, and men, women, and very soon children were gathered together to tend the machines. The first factories were of the rudest description, and the employees were worked the longest hours and without the least regard to health or morality. It was the day of absolute *laissez faire*. There were no factory laws (*q.v.*), and experience had not taught that it pays the employer to consider the needs and health of his employees. Men and women were worked like cattle and housed worse than the cattle. Women, since they would work cheaper, displaced men, and children soon displaced women. The horrors of the early factory system to-day can scarcely be credited. Yet the facts are proven by the unquestioned evidence of parliamentary commissions and English Blue Books.

The demand for children commenced and kept pace with the growth of the whirling spindles. When the adjacent supply was found insufficient, pens were established on the banks of the canals, into which hundreds of boys and girls were collected, from scattered cottages and villages, the poorhouse and street, and shipped by barge to feed the merciless mills.

Infants five years old were allowed to work in the cotton factories from five in the morning until eight at night, and in the bleaching works uncomplaining little ones of 11 and under were kept continuously at labor during the same hours in a temperature of 120°. In the unhealthy occupation of pin-making similar conditions prevailed. Children often walked 20 miles a day in the performance of their tasks. Mothers who lived near the cotton factories might be seen taking their crying innocents to work at dead of night. Half the infants of Manchester died before three years of age, and in some districts the death-rate under 20 was larger than in other parts of England under 40. In portions of factory counties, the youthful population was physically worn out before manhood; a notable decrease took place in the height of adults, and the effect began to be nationally apparent in the physique of the recruits who offered themselves for the army and navy. The following description shows the atrocity of these early factory days:

"Trafficers contracted with the overseers for removing their juvenile victims to Manchester or other towns. On their arrival, if not previously assigned, they were deposited in dark cellars, where the merchant dealing in them brought his customers and where the mill-owners, by the light of lanterns, being enabled to examine the children, their limbs and stature having undergone the necessary scrutiny, the bargain was struck and these poor innocents were conveyed to the mills. . . . In very many instances their labor was limited only by exhaustion, after many modes of torture had been unavailingly applied to force continued action. . . . Discrimination of sexes was not regarded; vice, disease and death luxuriated in these receptacles of human woe" (*History of the Factory Movement*, by Alfred (pseud.), vol. 1, chap. II, p. 17).

It was such conditions as these that led to the factory laws (*q.v.*) of England.

In the United States the factory system was not developed till the present century. It was the policy of England to prevent her American colonies from having machinery, in order to keep them dependent upon the trade of the mother country. The first spinning-jenny seen in America was exhibited in Philadelphia in 1775. Efforts at a factory were made at Worcester, Mass., in 1780. Parliament, however, enacted strict laws, forbidding, under severe penalties, the export of machinery from England. After the War of Independence machinery was rapidly developed. The first textile factory was erected at Beverly, Mass., in 1787. Samuel Slater, whom President Jackson called "the father of American manufactures," erected the first factory with power machinery at all adequate in Pawtucket, R. I., in 1790. In 1794 Eli Whitney, of Massachusetts, invented in Georgia the cotton-gin. Only gradually, however, did the factory system replace home industries. Women preferred to work in their homes, and reluctantly entered the factories. The early factory employees were drawn from the American families and homes in the neighborhood, and from the most intelligent homes.

The spirit and intelligence of the factory girls of Lowell and other New England towns are well known. But gradually conditions changed. Factories grew larger and larger. The duties of the employees grew more and more merely technical. Immigration set in. Factory populations developed. The moral tone of the factory was lowered. Uneducated girls and families, being able to do the merely manual work of tending the machines, were employed. Gradually the factory system, as we know it to-day, was developed.

In his report of the Bureau of Statistics of Labor of Massachusetts for 1881, Mr. Carroll D. Wright said (p. 466):

"In our cotton mills especially, the women and children largely exceed the men, being often from two-thirds to five-sixths of the whole, and the proportion is steadily increasing. And what are these women and children but the very weakest and most dependent of all the people?"

Elsewhere an operative testifies:

"Mill life has a most demoralizing effect upon women and children, especially on girls who have no parents in the mills to watch over them. I will not permit my girls to work in any other mill than the one I am in, and where I can keep my eye on them. Not that I am afraid they will do anything wrong, but the influences of a mill are very bad. If a child of a tender age goes to work in the mill, constantly breathing a temperature of 90 degrees both winter and summer, it is sure to grow up puny and die early. I get so exhausted that I can scarcely drag myself home when night comes."

Another operative testifies:

"Young girls from 14 and upward learn more wickedness in one year than they would in five years out of a mill."

Mr. Connolly, Factory Inspector of New York, says (Report for 1887, pp. 31, 45, 46):

"Many children overestimate their strength and endurance, and take hold of work for which they are unfitted by nature, and thus work themselves into consumption or sustain ruptures or other bodily damage. . . . The water-closets for males and females adjoin each other in 95 per cent. of the workshops and

factories throughout the State of New York, where females are employed, and in hundreds of cases the sexes both use the same retiring-rooms. . . . The ventilation of the average water-closet in manufactories is very poor, the science of hygiene not being well understood or considered when the structures were erected. The odors very often have no other escape but into the work-rooms, and the smell is very perceptible to the nostrils of the visitor. Disease must of necessity burden the air of these institutions, and the health of the operatives be gradually but surely undermined."

The reader, however, must not consider these descriptions as true of existing conditions.

There has been in most States considerable improvement. Yet many condemn even the most carefully built and regulated factory, and believe the factory system itself hurtful and unnecessary. Says the socialistic author of *Merry England* :

"What are the invariable accompaniments of the factory system?

"Foul air, foul water, adulterated foods, dirt, long hours of sedentary labor, and continual anxiety as to wages and employment in the present, added to a terrible uncertainty as to existence in the future.

"Look through any great industrial town in the colliery, the iron, the silk, the cotton, or the woollen industries, and you will find hard work, unhealthy work, vile air, overcrowding, disease, ugliness, drunkenness, and a high death rate."

This is all but invariably the view of the factory system held by labor reformers. Even Mr. Hobson (*Evolution of Modern Capitalism*) argues that the factory system breaks up family life. He says (pp. 319, 320) :

"Before the industrial revolution women were quite as busily and numerous engaged in industry as now, and the children employed in textile and other work were often worked in their own homes with more cruel disregard to health and happiness than is now the case. Even now the longest hours, the worst sanitary conditions, the lowest pay, are in the domestic industries of towns which still survive under modern industry. But tho the regular factory women and the half-timers are generally better off in all the terms of their industry than the uninspected women and children who still slave in such domestic industries as the trimmings and match-box trades, the growing tendency of modern industry to engage women and children away from their homes is fraught with certain indirect important consequences. When industry was chiefly confined to domestic handicrafts, the claims of home life constantly pressed in and tempered the industrial life. The growth of factory work among women has brought with it inevitably a weakening of home interests and a neglect of home duties. The home has suffered what the factory has gained. Even the shortening of the factory day, accompanied as it has been by an intensification of labor during the shorter hours, does not leave the women competent and free for the proper ordering of home life. Home work is consciously slighted as secondary in importance and inferior because it brings no wages, and if not neglected, is performed in a perfunctory manner, which robs it of its grace and value. This narrowing of the home into a place of hurried meals and sleep is, on the whole, the worst injury modern industry has inflicted on our lives, and it is difficult to see how it can be compensated by any increase of material products. Factory life for women, save in extremely rare cases, saps the physical and moral health of the family. The exigencies of factory life are inconsistent with the position of a good mother, a good wife, or the maker of a home. Save in extreme circumstances, no increase of the family wage can balance these losses, whose values stand upon a higher qualitative level.

"The direct economic tendency of machine-industry to take women and children away from the home to work must be looked upon as a tendency antagonistic to civilization."

There is, however, another view, the contrary of this. Mr. Carroll D. Wright argues in the

American supplement to the *Encyclopædia Britannica* (article "Factory") that the system, tho by no means perfect, is far in advance of previous methods of production. He says :

"As to the assumption that the factory tends to destroy domestic ties and habits, it may be said that this charge against the factory grows out of another assumption : that the cottage of the domestic worker was the ideal home. It is poetry which calls such home a cottage ; history rather calls it a hut. The home of the worker of old was the workshop also, and the wheels or looms disputed with the inmates for the room. Small, close, crowded, with bad air and bad surroundings, the hut was occupied day and night by a class which cannot find its kin under the factory system, for the operative of to-day, as a rule, occupies a home, even in the factory, tenement or boarding-house, superior in every sense to the home of the domestic worker. The morals in all respects under the individual system were greatly below those of the factory operatives of to-day. The evils which became apparent during the early days of the factory system were simply the results of bringing together the labor which had become pauperized under the domestic system, and in agricultural districts. The employment of young children is now forbidden by law wherever the factory has gained a strong foothold. The factory has not so much destroyed the home as it has enabled members of broken families to earn a livelihood. If it has at times taken the mother from the care of her young children—the worst feature of the employment of married women—it has enabled more who had no home to become self-supporting. . . .

"We are deceived because the factory, by and through the perfection of machinery and the development of the division of labor, is constantly employing a less and less cultivated class of operatives ; . . . are too apt to conclude that the factory degrades, when the fact is it has enabled the lower order to step up in the scale of employment, in living, and consequently in civilization. This process is constantly narrowing the limits of the class which occupies the lowest step in the progress of society. This mission alone stamps the factory system as an active element in the moral elevation of the race. Of course we speak of the factory under men who realize that they have some responsibility beyond declaring dividends. A narrow-minded, close-fisted employer, who regards his people as his machines, taking no pains relative to their moral well-being, never recognizing that by congregating labor for his own profit he owes it something besides wages, such an employer will have a factory which will convince any community that it is not an element in civilization. The man should be condemned, not the system.

"If it could be shown that the factory leads to intemperate habits, it would follow conclusively that it is productive of unthrift and poverty—the sure conditions resulting from intemperance. It is true that a great deal of drunkenness exists in factory towns and among factory operatives ; it is not true that the factory is the creator of this.

"The charge that the factory feeds prostitution and swells the criminal lists is absolutely unfounded. This impression first grew from the condition of Manchester, England, where a large cellarage population, which has entirely disappeared, was attributed to the factory. It has been shown by the returns from the penitentiary of Manchester that the ranks of prostitution were not fed from the factory, eight only out of 50 coming from the factory, and 29 out of 50 from domestic service. An extensive examination of the criminal records of a large number of British factory towns discloses the fact that neither the ranks of prostitution nor the criminal lists are increased to such extent from the factory population of these towns as from other classes. This is equally true in this country. It should be borne in mind that regular employment is conducive to regular living, and that regular employment does not harmonize with a life of prostitution, intemperance, and crime. The virtue of the factory women of this country and of Europe will compare favorably with that of any other class, and much better than with many departments of social life. Certainly there is nothing in factory employment conducive to vicious lives. (See PROSTITUTION.)

"The impression that the factory tends to intellectual degeneracy is a greater fallacy than the preceding. Through the simplification of mechanical processes ignorant labor is congregated in factory centres, but, as we have said, it is not created nor induced by the

The Favorable View.

factory. The fact that ignorant masses are enabled by the factory to engage in what it once took skilled labor to perform has given the widespread impression that the factory has degraded the skilled, when the truth is, it has lifted the unskilled; and this is the inevitable result of the factory everywhere. Certainly it is better for the persons engaged than the filthy little shop, occupied by a few foul-talking people, which characterized the domestic system. Instead of dwarfing the minds and the skill of the skilful, as is often alleged, the factory enlarges the minds and increases the power of the unskilful.

"That some factory employments are injurious to health is true, but it is not true that factory employment as such, in comparison with any other mechanical employment, is unhealthy. The first requisites of a watch-factory are neatness and abundance of light. It is now recognized that no man can do his best work unless he is physically comfortable. Before the system can be condemned in its entirety, it must be shown that it is worse than that which is displaced. We need not apologize for the weaknesses of the present, for they come mostly from ignorance, not from the system. (See also WAGES; LABOR; CHILD LABOR; WOMAN'S WORK AND WAGES; UNEMPLOYMENT; PRODUCTIVITY; MANUFACTURING; MACHINERY).

Hobson (1894); *Report on the Factory System of the United States*, by Carroll D. Wright, in vol. ii. of the Tenth Census (1882); *The Industrial Revolution*, by Arnold Toynbee (1887).

FAIR TRADE.—During the period of industrial and commercial depression that prevailed in England as well as the United States from 1873-79, the idea became somewhat popular in England that the cause in the case of that country was the *unfair* condition which characterized British international exchanges; Great Britain admitting into her own ports without duty nearly all the products of foreign nations, while these same nations at the same time not only imposed heavy and often prohibitory duties on the importation into their territory of British products, but also in some instances, as in the case of the beet-root sugar of France, subsidized competition to make it possible to undersell British products in England's own market by the granting of bounties on exports.

It was therefore proposed to institute a system of *fair* trade by having England affix to each country a tariff as nearly as possible corresponding to the tariff which such country enforced against English products. The proposition gained some passing favor, but has made no serious impression on England's settled policy and conviction that free trade is best. (See FREE TRADE.) The same idea has to some extent been agitated in this country under the name of reciprocity (*q. v.*).

FALKNER, ROLAND POST, was born in 1860 at Bridgeport, Conn. He was graduated with the title of A.B. at the Philadelphia Central High School in 1879; entering the Wharton School of Finance and Economy of the University of Pennsylvania, he received the degree of Ph.B. in 1885. Studying at Paris, Berlin, Leipzig, and Halle, he received, in 1888, the degree of Ph.D. at Halle. Becoming an instructor in the Wharton School of Finance and Economy, he was elected to the associate professorship of statistics in the same institution in 1891. The same year he was chosen Statistician of the Senate Subcommittee on the Tariff—a position he has since held. He was the first Corresponding Secretary, and is now Vice-President of the American Academy of Political

and Social Science. He has been from the beginning an associate editor, and is now editor of the *Annals* of the Academy. He is a member of various learned societies, among them the American Economic Association and the American Statistical Association. Since 1890 he has been Assistant Secretary of the National Prison Association. His writings are, among numerous monographs: *Prison Statistics of the United States* (1889); *Statistics of Prisoners* (1890, 1892); a translation of Meitzen's *Geschichte, Theorie und Technique der Statistik* (1891); *The Theory and Practice of Price Statistics* (1892), etc.

FAMILY.—By the word *family*, in sociology, is usually meant the small community formed by the permanent union of one man and one woman, or of one or more men with one or more women, together with the children born to such unions, either living in one house or forming one domestic group. This word is sometimes, however, used to include the servants or slaves belonging to the family proper and living immediately with the family proper. Again, going to the opposite extreme, and putting the emphasis, not upon the living together, but upon the legal or the blood relation, the word is used to denote the unity of those related by legal blood relation, primarily parents and their children alone, no matter where they reside, but sometimes made to include parents, children, uncles, aunts, cousins, sons-in-law, daughters-in-law, and even still more remote connections.

Etymologically, the word, by most authorities, is derived through the Latin *familia*, from the Oscan *famel* (servus), originally signifying the servile property, the thrall of a master, and later used for all domestic property, things as well as persons, bearing only too plain impress of what we shall find to be the Roman conception of the family relation.

We shall consider the subject under the following heads:

I. The Origin of the Family. II. The Prehistoric Family. III. The Classic Family. IV. The Early Christian Family. V. The Medieval Family. VI. The Modern Family. VII. The Sociologic Function of the Family. VIII. Various Theories of the Family: (a) Theory of Permanent Monogamy; (b) Theory of Ready Divorce; (c) Theory of Free Love. IX. The Family Threatened and How to Defend it.

I. THE ORIGIN OF THE FAMILY.

All sociologists find the origin of the family in general in the sexual relation, but as to the more exact form of its origination there is still diversity of opinion, and we must trace a development of view. Before the discussion of the question in the scientific spirit in the study of comparative biology, ethnology, etc., it was generally held by orthodox tradition that the family arose by the ordering of God in the union of the first man and the first woman. When science began to study the question, and the hypothesis of evolution became prevalent, the earlier writers—McLennan, L. H. Morgan, Bachofen, Lubbock—generally taught that the sexual

relation of men and women was at first one of promiscuous union, from whence the family was a comparatively late evolution in the process of civilization, through the survival of the fittest—that is, in this case the institution or custom best fitted to preserve life. Later and more careful study by such men as Sir Henry Maine, Herbert Spencer, Charles Darwin, Peschel, Starcke, Letourneau, Westermarck, finds that the theory of promiscuous union is, to say the least, not proven, tho these writers disagree as to what to put in its place. Sir Henry Maine holds that the original communities of men may have taken "all sorts of forms" (*Dissertations on Early Law and Custom*, p. 281). Darwin says:

"If we look far enough back on the stream of time, it is exceedingly improbable that primeval men and women lived promiscuously together. Judging from the social habits of man as he now exists, and from most savages being polygamists, the most probable view is that primeval man aboriginally lived in communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men" (*Descent of Man*, ii., p. 346).

Spencer holds that the family relation evolved itself thro being the relation best fitted to produce and rear children (*Principles of Sociology*, vol. i., part 3, chap. 9). Starcke

Various Views.

finds the evolution of the family the best means of enjoying property. De Coulanges finds the family, at least in Aryan races, forming around the religious worship of ancestors. The theories of Westermarck and Letourneau we shall consider later. Yet however the authorities differ, in much they are agreed. They all hold that out of very various beginnings, more or less loose, the monogamic family has been evolved as, for one reason or another, the best (altho that this is a finality they are not agreed).

General Conclusion.

They all hold that monogamy was not, as a rule, the first form. Among animals different forms of the family exist, yet the family has certainly been evolved on the plane of evolution that they have reached; why not, then, among even the earliest and lowest men? Among only a few wild animals does promiscuity prevail. A strict pairing is the rule among some monkeys, ruminants, ungulates, and predatory animals; other monkeys are polygamous, but still in families. Moreover, the male animals are jealous of the possession of females. It is also well known that promiscuity tends to infecundity. Yet a study of all the facts will warn one from dogmatism as to the origin of the family, and show the variety of forms which the family relation has taken among men. We therefore condense some of the arguments for an origin in promiscuity as well as the arguments against it.

Of the arguments for the origin of the family in promiscuous union, Mr. Andrew Lang has made, perhaps, the best summary in his article in the *Encyclopædia Britannica*. He says:

"The following facts are to be noticed: "1. At whatever epoch civilized travelers have visited peoples of less cultivation, they have noted, with unconcealed surprise, not the family, but promiscuity and polyandry. They have found men and women living together in what seemed unregulated

community, or they have found that the woman had several husbands, and often that these husbands were brothers. . . . Thus Herodotus says of the Agathyrsi, a Scythian people (iv. 104): 'They have their women in common, that they may all be brothers of each other.' The Nasamones (iv. 172) have similar customs; of the Massagetæ (i. 216) it is said that each marries a wife, *καί ἕνα ἄνδρα ἀπέθραυε*. Aristotle alludes to similar promiscuity among the Libyans (*Pol.* ii., 3, 9); they have their women in common, and distribute the children by their likeness to the men. Diodorus Siculus reports the same manners among the Troglodytes and the Ichthyophagi on the coast of the Red Sea. . . . Turning to modern savages, we find the custom of lending wives, as an act of friendliness and hospitality, very common. This may be no more than mere profligacy in a society where male kin is recognized; but the marriage custom of Thibet, which assigns to a woman several brothers as joint husbands, cannot be thus explained. This amazing practice is the rule of life 'among 30,000,000 of respectable people' (Wilson, *Abode of Snow*). As to the area over which some form of polyandry extends, the reader may consult Mr. M'Lennan's *Primitive Marriage* (Edinburgh, 1865, pp. 178, 183), where it is traced 'to points half round the globe.'

"2. If we can trust the traditions of Indo-European and other polite peoples, they too once lived in a stage which can hardly be discerned from promiscuity, and they too allotted many husbands to one wife. Beginning with Greece, we find the legend in Suidas (p. 3102), that the women of Attica abandoned themselves to unchecked vice, and that the male parentage of children could not be ascertained. According to the story of Varro (Augustine, *De Civ. Dei*, l. xviii., c. 9), it was Cecrops, the serpent king, who first instituted marriage, just as the Australian natives credit the lizard with the discovery. The Hindus give it to Svetaketu, before whose date, 'women were unconfined, and roamed at their pleasure. . . . This ancient custom is even now the rule for creatures born as brutes. . . . and it is still practised among the northern Kurus' (Muir, *Sanscrit Texts*, part ii., p. 336). The Egyptians attributed the origin of marriage to the rule of Menes; the Chinese to Fohi. As to polyandry among Aryans of India, a famous passage in the *Mahabharata* tells how the five brothers Pandava 'married the fair Draupadi with eyes of lotus blue.' The whole legend of these princes is so marked with the stamp of polyandrous institutions, that the very terminology of polyandry, the system of nomenclature called 'classificatory,' is retained. Granduncles, in this episode of the *Mahabharata*, as among the Red Indians, are called grandfathers, and uncles, fathers.

"3. If the practices which make kindred through males difficult or impossible to recognize were ever universally prevalent, they will have left vestiges of their existence in the custom of tracing descent through females. Again, where that custom is met with, the marriage has become fixed, and where women are mistresses of the household and heads of the family, it is not easy to give any other explanation of these facts than this, that they are survivals from a time when the union of the sexes was vague and temporary. Where, then, do we meet with examples of kindred traced through the female line? Kindred through women is recognized in Australia (with exceptions among certain tribes), in the Marianne Islands, in Fiji, Tonga, and some other isles of the Pacific, and in the Caroline Islands. Among the Kars of the Golden Chersonese, the tribes are divided into Sgans, who recognize male descent, and Pwos, who reckon by the mother's side. The natives of the province of Keang-se

'are celebrated among the natives of the other Chinese provinces for the mode or form used by them in address, which is Laon peon,' paraphrastically translated (Morgan, *Systems of Consanguinity and Affinity of the Human Family*, p. 452), 'Oh, you old fellow, brother mine by some of the ramifications of female relationship!' To select some more modern instances from M. Giraud Teulon's collections (*Origine de la Famille*, Geneva, 1874, p. 15), the Singhalese, the Nairs of Malabar, the Kocchs, an Indian tribe, and the Zaporogue Cossacks, with the red men of North America as a rule, and the Indians of British Guinea, to whom we may add many African tribes (Bowditch, *Mission to Ashantee*, p. 185, London, 1873; Munzinger, *Ost-Afrikanische Studien*, 1864), count kindred by the mother's side. Another collection of examples will be found in Mr. M'Lennan's *Primitive Marriage*. . . .

Evidences of Promiscuity.

Descent Traced through Females.

"4. It has been shown that the actual practices of many barbarous races make the existence of the patriarchal, and still more of the monogamous family impossible, and that the traditions of the races called Aryan, with many fragments of their customs, testify to a similar state of things in the past experiences of nations now organized on the basis of the family. We must now ask—(1) Of what nature are the wider tribal associations of savages? (2) How did they come into existence? (3) Are there any vestiges of similar and similarly formed associations among peoples which now possess strict marriage and kinship through males? We find that the Australian black fellows and the red men of North America are grouped in *local tribes* which generally are named from the lands they occupy. Thus, the Onondaga are people of the hills, the Mohawks people of the flint, the Senecas people of the great hills, the Oneidas people of the granite, and so forth (Morgan, *League of the Iroquois*, 1851). In Australia the tribes take the names of districts, as Ballarat, Wandyalloch, and Moreton Bay. Within these local tribes there are smaller associations, variously called 'clans,' 'families,' 'septs,' 'tribes,' 'by travelers. They are, as a rule, governed on this principle in Australia—'All the children take after the clan of their mother, and no man can marry a woman of the same clan, altho the parties be born of parents in no way related, according to our ideas' (G. S. Lang, *Aboriginals of Australia*, Melbourne, 1865, p. 10; Gray's *Journals*, etc., ii. 227). These smaller associations which may not intermarry are named after some animal, vegetable, or other natural object. A member of the Kangaroo associations may not slay or eat the kangaroo, which he holds in honor, and a Paddymelon must abstain from paddymelon. The obvious result of this scheme of prohibited marriage is to make every local tribe

Tribes.

contain much the same assortment of smaller communities. Looking at North America, we find the local tribe of Senecas to be composed of sets of persons called by the name of Wolf, Bear, Turtle, Beaver, Deer, Snipe, Heron, Hawk, and many of the same names prevail among Cayugas, Oneidas, Mohawks, and the rest. Just as in Australia no man may marry a woman of the same name, tho she may have been born hundreds of miles away, and may be no sort of relation in our sense of the word. As in Australia, the animal or plant from which each association takes its name is sacred; in America it is called the totem. . . .

"The essential features of these associations and groups of kindred are, for our present purpose—(1) Their indubitable growth out of *female* kinship, and the rule which prohibits marriage between persons who are of the same name, and own descent from the same plant, animal, or thing; (2) their existence as stocks of different blood in the same local tribe; and (3) their acknowledgment of kinship with, and of the duty to support in war, or to revenge, other members of the same name.

"5. The question now rises, Do we meet similar associations among civilized peoples who now possess the family? First we find Mr. Hart, of Canton, saying (*Ancient Society*, pp. 364, 365): 'In some parts of the country large villages are to be met with, in each of which there exists but one family name; thus in one district will be found, say, three villages, each containing two or three thousand people, the one of the Horse, the second of the Sheep, and the third of the Ox family name. . . . Just as among the North American Indians husband and wife are always of different families—that is, of different surnames. Custom and law alike prohibit marriage on the part of people having the same family surname. The children are of the father's family—that is, they take his surname.' (Compare *Narrative of Two Mahometan Travelers*, Pinkerton, vol. vii.) The Arabian travelers had the same law at home, prohibiting marriage between people of the same family name.

"Looking at India, we find in the *Institutes of Menu* (iii. 5) that a man of the twice-born classes may not marry 'a woman descended from his paternal or maternal ancestors within the sixth degree, nor [in words believed to be a comment on the original] one who is known by her family name to be of the same primitive stock with his father.' No one, that is to say, may marry within the

ghotra, just as no Red Indian may marry within the limits fixed by the totem. If the *ghotra* was counted, or if the Chinese family name ran, on the female side, Chinese and Brahmans would be exactly in the position of Australian blacks, as far as prohibited degrees are concerned. Mr. Cunningham (*Digest of Hindu Law*, Madras, 1877) says that the old rule about the

ghotra is falling into disuse, and that local custom in many places permits it to be disobeyed. Now, just as observers in India note this change of practice, so observers among the Red Indians and Australians note another change of practice. Kindred among these peoples is very gradually beginning to be reckoned by the male line; children are being counted among some tribes in the clan of the father (Morgan, p. 86).

"Leaving India, and turning to Greece and Rome, we find the local tribe, and subordinate to the tribe, two forms of associations called the *yévos* and gens, which are prominent in early history and gradually die out. Thus, tho in the Twelve Tables, as we have seen, the members of the gens succeed to the property of an *instans*, yet in the second century Gaius declares (*Inst.*, iii. 17) that all Gentile law had fallen into desuetude. The gens, then, was, as its very name implies, a form of kindred, but old and hastening to decay. . . .

"In the example of the Greek *yévos* we again find the common name a patronymic, generally thought to be derived from a hero. We find that all who bore the name shared certain religious rights, and before Solon's date were co-heirs to property, and took up the blood feud if one of the *yévos* were slain. Yet the *yeuvétra* are often defined as *not* akin in blood, so entirely did the old sense of relationship dwindle, in Greece as in Rome. . . .

Classic Customs.

"It has been usual, almost universal, to explain the Greek *yévos* and Roman gens by simply saying, like Mr. Freeman (*Comparative Politics*, Macmillan, 1873, p. 111), 'The family grew into the clan, the clan grew into the tribe.' Mr. Freeman says we can trace this process best 'among men of our own blood.' But when we examine the early associations of the English (Kemble's *Saxons in England*, vol. i. p. 458), we find, just as in America, just as in Australia, groups of kindred of the same name—take Billing, by way of example—scattered from north to south through all the local tribes. We have seen how this happens in America and Australia, we have seen that there the family, in Mr. Freeman's sense, does not grow into the clan. Did it do so in Attica and Italy, and, if so, how did a tribe, which was *ex hypothesi* but a swollen clan, contain so many stocks which claimed distinct origin and distinct mythical ancestors? How did these stocks come to be scattered through local tribes, not grouped in one? The growth of savage tribes is not a development of the family; tribes singularly like those of savages are found in early civilizations. Had the two kinds of kindred different origins?

"There remains a point to notice. The thoroughly savage totem-kindreds reverence the animal, plant, or other object from which they take their name and claim descent, and they use it as a badge. For Greek and Rome survivals of this usage see Plutarch, *Theseus*; M'Lennan, 'The worship of plants and animals,' in the *Fortnightly Review*, 1869-70; and the *Antiquities of Heraldry*, by W. S. Ellis, 1869. If the ordinary theory, that the tribe and clan are overgrown families, be rejected, the converse theory may be stated thus: The totem-kindreds of savages grow up through exogamy and female kin. The change to male kinship (a change which is demonstrably taking place in America and Australia) produced something like the Chinese circle of relationship. The substitution of the name of a fictitious ancestor for that of the sacred plant, animal, or natural object produced a circle of affinity like the Hindu *ghotra* of customary religion. The decay of the prohibition to marry within the kin united by the family name, like the growing laxity of rule in the *ghotra*, produced something like the Greek *yévos* and the Roman gens. Nothing remained but joint religious rites, a common place of burial, a common name, a vague feeling of connection, traditions of the prohibition to marry within the gens, the duty of taking up the blood-feud, and vestiges of the joint-heirship. In process of time the intenser affections of the family caused the old gentile ties to disappear, and gentile law became an empty memory. . . .

"There are next certain customs to be examined, which tend, as far as they go, to show that civilized society passed through savage stages. The chief of these customs are the ceremony of capture and bridal etiquette. As to the ceremony of capture it is superfluous to say much, as the subject has been handled, with complete originality and copious illustrations, in M'Lennan's *Primitive Marriage*. The classic example of the ceremony of capture is thus stated by C. O. Müller (*History and Antiquities of the Doric Race*, English translation, Oxford, 1830, vol. ii. p. 208): 'Two things were requisite as an introduction and preparation to marriage at Sparta: first, betrothing on the

part of the father; secondly, *the seizure of the bride*. The latter was clearly an ancient national custom.' Müller then describes the clandestine intercourse, which lasted for some time, before the man 'brought his bride, and frequently her mother, into his house.' The intercourse of bride and groom among the Iroquois of Lafitau's time was likewise clandestine.

Capture.

For the practice in Crete, Müller quotes Strabo, x. 482, D. A similar custom prevailed in Rome (Apuleius, *De As. Aur.* iv.; Festus, s. v. "Raptus"), and was supposed to be derived from the time of the Sabines. Mr. McLennan finds the practice necessary to the constitution of the relations of husband and wife among the Calmucks, the Tunguzians, the Khonds, the Fugians, the Welsh, the Arabs, the Irish, and various other races. He explains its existence by the institutions of exogamy (*i.e.*, the rule prohibiting marriage between people of the same blood), and by the prevalence of hostility between the tribes of rude times. . . .

"A strange piece of barbarous etiquette may hint that the kindred of the bride and groom were once hostile groups. The daughter-in-law, among many races, is forbidden to speak to her father-in-law; the mother-in-law must hide when she sees her son-in-law. The wives treat their husbands with what may be a survival of hostility, and never name them by their names. Examples are collected in Sir John Lubbock's *Origin of Civilization* (pp. 11, 12). The practices are found among races on the border of the Polar Sea, in the Rocky Mountains, in Southern Africa, among the Caribs, Mongols, and Calmucks, in China, in Siberia, and in Australia. To these instances adduced by Sir John Lubbock we may add Bulgaria (Dozon, *Chants Populaires Bulgares*).

"Herodotus says (i. 146) that the wives of the early Ionians would not call their husbands by their names nor sit at meat with them, and instructed their daughters to practise the same reserve. The reason assigned is that the women were originally Carians, whose parents the Ionians had slain. It may be allowed that this world-wide practice, too, testifies to a time when men married out of their own group, and all groups were hostile each to the other. Perhaps the English local custom, which forbids the parents of bride and bridegroom to be present at the marriage ceremony, holds the same antiquity.

"We have now to note the widespread existence of a system of nomenclature, which can hardly have arisen in times when the monogamous family was the unit of society. Mr. Lewis Morgan, of New York, was the discoverer of a custom very important in its bearing on the history of society. In about two thirds of the globe persons in addressing a kinsman do not discriminate between grades of relationship. All these grades are merged in large categories. Thus, in what Mr. Morgan calls the 'Malayan system,' all consanguineal, near or far, fall within one of these relationships—grandparent, parent, brother, sister, child, and grandchild." No other blood-relationships are recognized (*Ancient Society*, p. 385). This at once reminds us of the Platonic Republic. "We devised means that no one should ever be able to know his own child, but that all should imagine themselves to be of one family, and should regard as brothers and sisters those who were within a certain limit of age; and those who were of an elder generation they were to regard as parents and grandparents, and those who were of a younger generation as children and grandchildren (*Timæus*, 18, Jowett's translation, first edition, vol. ii., 1871). This system prevails in the Polynesian groups, and in New Zealand. Next comes what Mr. Morgan chooses to call the Turanian system. 'It was universal among the North American aborigines,' whom Mr. Morgan styles Ganowanians. 'Traces of it have been found in parts of Africa' (*Ancient Society*, p. 386), and 'it still prevails in South India among the Hindus, who speak the Dravidian language,' and also in North India, among other Hindus. The system, as Mr. Morgan says, 'is simply stupendous.' It is not exactly the same among all his miscellaneous 'Turanians,' but, on the whole, assumes the following shapes. Suppose the speaker to be a male, he will style his nephew and niece in the male line, his brother's children, 'son' and 'daughter,' and his grandnephews and grandnieces in the male line, 'grandson' and 'granddaughter.' Here the Turanian and the Malayan systems agree. But change the sex; let the male speaker address his nephews and nieces in the female line—the children of his sister—he salutes them as 'nephew' and 'niece,' and they hail him as 'uncle.' The reader is referred for particulars to Mr. Morgan's great work,

Kinship.

Systems of Consanguinity and Affinity of the Human Race (Washington, 1871)."

For the argument for the origin of the family in other than promiscuous union we may turn to many authors, but best to Westermarck, who, in his *History of Human Marriage*, has treated this portion of the subject the most fully.

He argues that the family has probably existed from the beginning of the human race, because (1), accepting the evolutionary hypothesis of the ascent of man from the lower animals, the family is found among many of the higher animals. It is here evidently an evolution; among the lower animals it has not been found. Among the *invertebrata* the young owe their preservation mainly to chance. Even the mothers are exempted from nearly all care for their progeny. To the male's share falls nothing but the function of propagation. The mother usually does nothing but find a place to lay her eggs, perhaps an object to which she may fasten them; or sometimes something with which they may be covered. The eggs of insects, the highest order, are hatched by the heat of the sun. Among *mammals* the mother has great anxiety for her young, tho the father still has little, and is sometimes even the foe of his young. There are some mammals, however, where the father does care for the young, such as whales, seals, hippopotami, gazelles, antelopes, reindeer, squirrels, moles; and some carnivorous animals, as a few cats and martins, and possibly the wolf. Among the *quadrumanæ* what was before the exception is now the rule. The male and female live in pairs during the rearing of the young, and sometimes beyond, the father being the protector. This is especially true of the gorillas and man-like apes. The father usually sleeps at the foot of the tree on guard, while the mother and young are above. Among the Siamangs the father carries about the male young and the mother the female young. Among the gorillas the father sometimes builds a rude nest for the mother until after delivery. Among all animals there seems to be a rut season, yet among the higher animals the male and female keep together through the year. The evidence seems to be that such family life is evolved through natural selection. When the father protects the young they are more likely to live. Among the lower animals other means insure the existence of the species. Among most, enough eggs are laid to allow an enormous number to perish. Fish spawn enough roe to more than fill the sea, if it were all fecundated and hatched. The eggs of reptiles need no help from the father. Birds and mammals need paternal care, and thus get it. Among walrus, elephants, and bats, the females seem to herd together with their young, and thus seek protection rather than from the males. Among the Primates, marriage (defined as "a more or less durable connection between male and female, lasting beyond the mere act of propagation, till after the birth of the offspring," p. 10) Westermarck thinks due to the small number of the young, the long period of infancy, and the danger involved, incurred by the young. Marriage, he says, is thus rooted in family, and not the family in marriage (p. 22).

Animals.

Coming now to man, he finds the family existing from the start, as among the higher animals, tho more developed. He says that the asserted promiscuity of certain tribes is a mistake, and does not exist, while among the lowest tribes we find abundant proof of rude family life. If the father does nothing else, he builds the hut. Among the North American Indians it is considered disgraceful for a man to have more wives than he can support. Among the Fuegians, a youth can marry as soon as by fish or bird catching he can support a wife. Among the Australian Kurnai, a man, as a Kurnai once said, "hunts, fishes, fights, and sits about." Among the cannibals of New Britain, the chiefs see that their warriors maintain their wives, or the warriors are punished like school-boys. The South American Guaruanies will not risk their lives in hunting while their wives are pregnant; some tribes will not fight. Among the Bechuana and Kafirs, the youth is not allowed to marry till he has killed a rhinoceros. Family life is thus always connected with the support of the family. Among many tribes marriage is not thought to be completed, and sometimes is not recognized, unless a child is born; among the Shawanese and Abipones and other tribes the wife remains at her father's house till she has a child. Among the African

Early Family Life.

Baelle, the childless woman is not considered married. Among the Bedouins of Mount Sinai, a wife does not enter her husband's tent till far advanced in pregnancy. In Siam a wife does not receive her dowry, nor among the Aleuts does the husband pay for his wife, till a child is born. The Igorrotes of Luzon consider no engagement binding till the woman has become pregnant. Among many of the wild tribes of Borneo there is almost unrestrained intercourse between the youth of both sexes; but if pregnancy occur, marriage is held necessary. Westermarck thinks that among men there was once a rutting season. Beaumarchais says: "That which distinguishes man from the beast is drinking without being thirsty, and making love at all seasons." Westermarck says this was not always so. Every animal has its especial rutting season, often in spring, but not always. The same is said to be true of the wild Indians of California, the Watch-and-dies of Australia, the Tasmanians, the Hos, an Indian hill tribe, and many others. They have great religious feasts for procreation, sometimes regular saturnalia, as among the last named, when men become like animals, and women lose all modesty. In Rome a feast of Venus took place in April, and curious customs looking in this direction can be traced in Germany, England, and other countries. Westermarck finds the origin of the rutting season in the fact that at certain seasons the young are more likely to live, and that this season disappears among men, because they are more and more able to preserve their young at all periods. The development of separate families among man and the higher animals is said to be due in part to the difficulty in getting food. They must separate to range and get

Separate Families.

food, just as later they come together in tribes for defense. Westermarck believes that the theory of promiscuity has arisen from mistakes of travelers not understanding family customs, and says that sometimes unchastity has been increased by contact with civilization, as the aborigines of Australia brought into contact with the lower class of the whites, and the women of the South Sea Islands, the Sandwich Islands, and Patagonia corrupted by licentious sailors and adventurers. He says: "The immorality of many savages is certainly very great, but we must not believe that it is characteristic of uncivilized races in general. There are numerous savage and barbarous people—peoples among whom sexual intercourse out of wedlock is of rare occurrence, unchastity, at least on the part of the woman, being looked upon as a disgrace and even a crime" (p. 61). He mentions the Kafirs, the equatorial Africans, Dahomey, the Kabyles, the Central Asian Turks (among whom he says a fallen girl is reported as unknown). Among the Nias of the Indian Archipelago a pregnant unmarried girl and her seducer are both killed; among the Hill Dyaks licentiousness is prohibited; and thus in many tribes we have chastity side by side with tribes of great licentiousness. He mentions among the chaste, besides the above, tribes of the Philippine Islands, New Guinea, Tasmania, Loyalty Islands, Western Victoria, the Aleuts, Greenland, the Northern Indians, the Nez Percés, Apaches, the South Slavonians, the Finns, the primitive Turk-Tartars. He quotes Drury as saying that in Madagascar there are more modest women in proportion to the population than in England (*Adventures during Fifteen Years' Captivity on the Island of Madagascar*, p. 323). Westermarck says: "We may perhaps say that irregular connections between the sexes have, on the whole, exhibited a tendency to increase along with the progress of civilization" (p. 69). Among many savage tribes intercourse is very free among the young, but after pregnancy there is great strictness. Even in Scotland, before the Reformation, the practice of "hand-fastening" was common, whereby at the public fairs men selected female companions with whom to cohabit for a year, at the end of which period they could either leave or marry. The very extended if not almost universal custom of lending wives and sometimes children and servants among savages, Westermarck refers not to primitive promiscuous customs, but to conceptions of hospitality, the father looking upon his wife and children as property at his disposal. So too with the *jus prima noctes*, which has so generally existed in fact if not in law; it was held as a property right belonging to the strong. The weaker families felt honored if their kings, priests, or rulers made use of their wives. This custom is very common, and has existed very recently in Russia.

As for the fact that relationship is usually traced through the females, Westermarck gives a long list of tribes where it is traced through the males, and says that even where it is traced through the fe-

males, there are a good many other reasons that may be given for it other than that of uncertainty of the paternity. He says, for one reason, that in polygamous families, the paternity be certain, the relation is naturally traced through the mother, to distinguish the one wife's offspring from another's. The tie of the child to the mother is also naturally much closer than that to the father, so that in the "classificatory system" of blood ties, traced through the mother, Westermarck finds no evidence of a time when paternity was uncertain, because promiscuous union was the rule. He shows, too, that promiscuous union as among prostitutes tends to infecundity, and therefore is not probable as the origin of the race; also that the natural jealousy of men and animals is contrary to it. Polyandry he shows to be not rare, as in Thibet,

Descent Traced through Males.

but that is usually in pastoral peoples, where only one husband is at home at a time. He gives many instances of the jealousy of men over their wives. The Fuegians will let no one, especially young men, enter their huts. The Moquis allow their wives only to work indoors. Licentiousness and jealousy often go together. The jealous guard of Mohammedans over their harems is well known. A Tartar may repudiate a wife who shakes hands with a man. Among the nomadic Koriaks and other tribes, the women refrain from dressing their hair and from washing, and dress in rags to prevent their husbands growing jealous of them and killing them. Some Indians are said to cut off the hair and even noses of their wives, to render them safe against solicitation. Among many tribes husbands demand virgins for wives, or at least, as with the negroes of Togoland, pay a higher price for one. The Jewish "tokens of the damsel's virginity" are well known. Among many tribes the woman belongs to her husband even after his death. Among the Comanches, in Darien, Panama, and India, and many other countries, a man's wives are killed at his death, usually burned. Among many other tribes the wife must long worship his dead body. Second marriages are frequently condemned. All these are indications of the theory among such tribes of the woman as the property of the man. Such is also the fact that often the daughter is not consulted when given or sold in marriage. The fact that in many tribes she seems to have had greater liberty in earlier times than in later may be explained by the fact that at first marriage and the family were mainly matters of safety for the young, into which relation the mother entered more freely, and only gradually did the man come to consider himself the owner of his wife and children, and so buy his wife and sell his children. Among the Eskimos, and the same often occurs even now among the Turks, parents will arrange marriages for their children as soon as they are born. Early betrothals exist among many tribes. In Australasia girls are sometimes promised even before they are born, and the same is true in New Guinea, New Zealand, and Tahiti. Among the North American Indians the woman has more liberty. Among the Kurnai the girl often elopes with her husband and then returns and elopes two or three times till she is forgiven. In Radack marriages depended on a free convention, as seemed to be the rule in Micronesia. Among still more tribes the bride is stolen, and in most marriage ceremonies the capture of the bride by force is symbolized. Over the children, almost all tribes give full power to the parents. Even sons may be married against their will. "In Japan," says Mr. Griffis, "the Japanese maiden, as pure as the purest Christian virgin, will at the command of her father enter the brothel to-morrow, and prostitute herself for life. Not a murmur escapes her lips as she thus filially obeys" (*The Mikado's Empire*, p. 555). The power over children, even adult, is almost universal even in semi-civilized races, and in Judea, Greece, and Rome. According to Wallace, the father, in early Russia, was rather the administrator of a labor association than anything else. Even now French law gives great power over children until of age.

Woman the Property of Man.

Among all tribes and nations of men incest has always awakened horror, but there have been various degrees of prohibited marriages. Many tribes have very involved and far-reaching systems of kinship, within which marriage is forbidden. In a few tribes men will marry their sisters, and among the Veddahs of Ceylon these are considered the proper marriages. But among most tribes it occasions great horror.

Many tribes practise exogamy (*i.e.*, marriage outside the tribe); and some much prefer endogamy, but *almost* all seem to have some rule or practice.

The reason for the horror of incest and the practice of exogamy has been very variously stated. By some it has been thought due to an observation of the better results of cross-breeding than of inbreeding; by others, to the fact that tribes killed their own female children, as being expensive to rear; by others, to the fact that all women were private property, and it was cheaper and more glorious to capture a wife from a hostile tribe. These explanations, however, while with some truth, do not explain all the facts. There seems to be an innate aversion to marriage with those with whom one has long lived. Even horses and dogs are said to prefer those of other stalls. Marriage, however, by capture has usually passed into marriage by purchase. The price is often one of service, as with Jacob. Some times a kinswoman is given in exchange. The most common compensation is property. Among the Californian Karoks a wife was bought, unless unusually pretty and aristocratic, for half a string of dentalium shell. In British Columbia and Vancouver Island the prices range from £20 to £40; among the Kafirs, from 5 to 30 cows. The Damaras will give a girl for one cow. In Uganda, a wife can be bought for three bullocks, or six sewing needles, or a pair of shoes. Among the Fijians the usual price is a whale's tooth or a musket. In Japan and China the bridegroom gives presents to the bride, and this is sometimes stipulated for. Among early Aryan races the bride was usually bought. In the Homeric age a maid was called ἀλφεῖβονα, one "who yields her parents many oxen." Aristotle says that the ancient Greeks bought their wives. In Germany, the expression "to buy a wife" was in use till the end of the Middle Ages. The giving of the ring in the English wedding service is said to be a relic of the same custom. In Servia, in the beginning of the present century, Black George limited the price of a girl to one ducat. Presents to the bride during courtship are said to come from the same custom. In many tribes the adulterer simply pays the husband a fine for stolen property. Women are bought for what they can do. The Fægiens buy as many wives as possible to row their canoes. The purchase by marriage, however, among all peoples has more or less disappeared. In many the price paid for the bride came to be given by the father, after he had received it, to the bride, and hence rose the custom of the dower, or settling of a "portion" by the father upon the bride.

Wives by Purchase.

With this conception of marriage as a purchase of the wife, it is easy to see how those who could afford it should buy many wives, and polygamy become common tho not universal among savage tribes. Many North American tribes are strictly monogamic. Many Asiatic and African tribes are the same, including some of the lowest, as the Veddahs of Ceylon. But in almost all tribes it seems to be mainly a matter of money and power, since most princes have many wives. In China and most Mohammedan countries, while there may be only one wife, the law allows concubines. Polyandry is much rarer, but exists among the Aleuts, sometimes among the Esquimos. Polyandry is not unknown to the *Rig Vedas*. It seems to have existed among the Picts, and to have developed mainly in mountainous or rude climates, where women were few, and men would combine to own a wife, the one staying with her, while others would be away on excursions of chase or war. In almost all cases woman is owned for service. An Arab shiek said of his four wives: "This one carries water; this grinds the corn; this makes the bread; the last does not do much, as she is the youngest and my favorite." Polygamy thus means a division of labor, and is sometimes therefore favored among savage women. Monogamy seems usually to have gone before polygamy, and then to have returned. Divorce seems almost tho not quite universal. A wife that is bought can be sold, exchanged, or discarded. Such, then, according to one of the best modern authorities, is the origin of the family: *first*, the union of male and female, animal or man, to care for and defend the young—a union easily broken, where the woman, however, has considerable freedom; *second*, a union where the man rules the wife, and she is considered his property, with her children, he having obtained her, at first by capture, and later by service, exchange, or purchase, and where she is his servant, he going on to buy as many wives as he can afford to maintain; and, *thirdly*, a union rising from this into monogamy, and with more liberty for

woman. M. Letourneau, in his *Evolution of Marriage*, takes substantially the same ground as Westermarck in his view of the origin of the family. In the system of *Totems* found in Australia, and essentially, tho under other forms, in most uncivilized communities, he sees no remnant of a time of promiscuous intercourse, or trace of descent through the mother, but rather a property institution, which in general he believes marriage to be, marrying together in general, a large number of men and women connected by one *totem*. M. Letourneau believes that evolution has proven the enduring monogamic marriage to have been thus far the most fitted to survive, but holds all evidence to-day to indicate that the marital relation is now evolving still further into one of monogamic marriage, but not of enduring monogamy, but rather of easy divorce and "free-love."

Totems.

II. THE PREHISTORIC FAMILY.

Passing, then, from the question of the origin of the family, we come next upon the question of its form in civilized society as it exists when fully developed, tho not yet in the clear light of certain history. Here we are met with two clear types, the Semitic and the Aryan. The Semitic family is patriarchal and polygamous. Semitic races know little of individual liberty. They have found no medium between the anarchy of nomadic tribes and the hard tyranny of the despot. They have given the world its religion; above all, its conception of a one supreme and all-powerful Ruler. The family has partaken of this conception. It is founded upon obedience to one head. The wives and children are slaves; their duty is to serve and obey. Love has not been wanting, yet obedience is the fundamental relation. The Bible picture of Jacob with his wives and slaves and concubines and flocks and herds is a typical instance. Women were objects of sale, purchase, and ownership. The fathers of the bride and groom really contract the marriage. Marriage within the tribe and sometimes within the kin is the rule. Female captives are taken as wives (see the Bible stories), marriage is universal, and childlessness is a disgrace. Divorce is at the pleasure of the husband, and barrenness is a sufficient cause. Divorce is, however, less common than the introduction of a second wife. The son is the heir instead of the wife or daughter. The son may sometimes inherit even the father's wife. (See Absalom, in the Bible, when he seizes his father's throne.) Yet the family is strongly developed. It is the social unit. Family relationship and descent is carefully maintained. When a man dies childless it is his brother's duty to raise children for him. (See the Levirate in Bible customs.) Land is held by families.

The Semitic Family.

The Aryan family is monogamic. It is also the social unit. The family lives separately. It possesses rights and never dies. The principle and purpose for which the family is founded is the performance of the *sacra* or worship of ancestry. Personal immortality is the common faith. The dead, save a few great souls who, some believed, might inhabit heaven, are thought to descend into the earth. Hades is there, the place not only of the wicked, but of all, or, at least, well-nigh all.

The Aryan Family.

"For Hades underneath the ground,
A strict examiner is found."

—*Eumenides*, 273-275.

Æschylus in another place makes a son address his dead father: "Oh, thou who art a god under the ground." Isaiah says: "The grave cannot praise thee, death cannot celebrate thee; they that go down into the pit cannot hope for thy truth" (Isa. xxxviii. 18). They connected the dead with the tomb, perhaps as living there or hovering there. Hence they brought cakes, fruit, wine, milk, fire, etc., and laid them by or in the tomb. Ancestor worship they put first. In India Agni, in Italy Vesta meant the sacred fire burned to ancestors. Prayers to Agni and to Vesta came always first. There was in every home the sacred fire, never allowed to go out, always kept pure, and burning only certain woods. If in Rome there was one day in the year when all ancestral fires were allowed to go out, they were relit with special forms. Near the home of the living was the home of the ancestral dead. It was one home; in one part lived the living, and in one part lived the dead. On certain days the living ate solemn feasts by the dead. The first thing in the morning and the last at night they said prayers and chanted ancestral hymns before the sacred fire. Around this center grew the family. Only relatives could be buried in the ancestral home. When a woman married, she left her home and her gods and joined the home and gods of her husband. The fire was their protectress. Hecuba says to Priam: "Thy arms will not defend thee; this altar will protect us." Generation was not the center of the

family, but the fire. The daughter was not equal to the son. The object of marriage was to bear a son who could keep up the family fire. If sterile, a man could divorce his wife and marry again; or in Sparta and other places, intro-

duce some one else to give conception to the wife. The bridegroom, according to some, "must marry a daughter of his own people; he must not marry a woman of his own kin. The race on the one side and his own name on the other side marked the limits of his selection" (Hearn's *The Aryan Household*, p. 156). Not every son could receive and transmit the ancestral obligations. He must be born of legitimate union. In neither Greek, Roman, nor German law did the bastard receive recognition. The legitimate son was at birth received into the household with ceremonies and joy. No woman could perform the *sacra*. She was a part of the household, but not of the State. Thwing (*The Family*, p. 22) suggests that perhaps she was not allowed to celebrate the *sacra* because not belonging to the family permanently, as she might marry and belong to some other family. Chosen for a religious purpose, the wife, however, could not be put away except for sterility or sufficient cause. Such is the Aryan conception of the family, perhaps best given in Fustel de Coulanges' *Ancient City*. This ancestral worship seems to have existed with more or less distinctness among the Hindus, Iranians, Slavonians, Greeks, and Romans. Even Menu, at the time he wrote his laws, calls it the earliest

religion known to man. "The Semitic family," says Thwing, "is the germ of monarchy, the Aryan of the commonwealth."

III. THE FAMILY IN CLASSIC TIMES.

It is still a religious institution, but this is not so prominent. In the Homeric type there is great delicacy, dignity, tenderness, simplicity, love. No trace of polygamy appears. Concubinage is practised only by a few. Of domestic concubinage there is no trace. The essence of marriage lies in cohabitation, with a solemn public acknowledgment. Death alone dissolves the conjugal relation. The love of Penelope for Ulysses has rarely been surpassed. The tenderness of Hector and Andromache, the heroic love of Alcester, voluntarily dying that her husband may live, the filial piety of Antigone, the majestic grandeur of Polyxena, the saintly resignation of Iphigenia, the joyous, modest and loving Nausicaa—these, says Lecky, are "pictures of perennial beauty, which Rome and Christendom, chivalry and modern civilization have neither eclipsed nor surpassed" (*History of European Morals*, Am. ed., II., p. 296). Women, however, are servants. They perform indoor work, fetch water, and grind flour. Telemachus bids his mother mind her spindle and loom and not interfere in the debates of men.

Homer.

The family of the classical period proper of Greece is more religious in form and less pure in fact. Concubinage and intercourse with *hetairai* are not only allowed by the State, but publicly favored. The wife is kept well at home. She is married by her parents. Sophocles makes a woman describe the lot of her sex by saying: "When we are grown up we are driven away from our parents and paternal gods" (*Frag. Terms*). Athenians marry Athenians. The wife cares for the house and does not share the intellectual life of her husband. For this the husband goes to *hetairai*. Demosthenes says frankly: "We have *hetairai* for our pleasure, wives to bear us children and to care for our households" (*kata Neaupag*). Socrates asks: "Is there a human being with whom you talk less than with your wife?" (Xenophon, *Economics*, III., 12). The higher *hetairai*, like Aspatia, were queens; the lower lived a wretched life. The wife superintends the servants, cares for the sick, educates the children. Fidelity is required of the wife.

Greece.

Laxity is allowed the husband. Adultery on the part of the wife results in divorce; the adulteress, taken in the act, the husband can kill. The wife has some rights. She can bring action against her husband. The Spartan wife is more like the Homeric. She receives a large dower. In the time of Aristotle two fifths of the territory of Sparta had come into the possession of women. Their morals were purer. The Spartan husband was accused of being ruled by his wife. The ideal of Plato was far from the actual. He would instruct boys and girls alike in music, gymnastics, and even in war. He would make the woman and man equal, and minimize their differences. But he

advocates practically sexual communism, yet the reverse of licentiousness. No indulgence is allowed the passions. "In a city of the blessed, licentiousness is an unholy thing which the rulers will forbid" (*Republic*, Book V.). He would have as great care in breeding men as cattle. The State should put an end to the existence of the offspring of inferior parents. Men between 25 and 55 should alone marry women of 20 to 40. Precautions should be taken that neither father nor mother recognize their offspring; the State should assume the care of the children (*Republic*, Book V.).

The Roman family was at first like the Homeric. Phryne nor Aspasia could hold sway there. Marriage was of three kinds: *Confarreatio*, the religious; *coemptio*, the civil; *usus*, effected by a man and

Rome.

woman living together for one year. The husband is the priest of the domestic altar. He is responsible for the perpetuity of the family. If his wife is sterile he can divorce her. He has the right to reject or accept the child at birth. He has the right to join his daughter in wedlock and to compel the wedlock of his son. He has the right to exclude the son from the family hearth and to introduce a stranger. He is the judicial authority in the household, the judge of his wife. If she commit adultery he can put her to death. Over his children his power is the same. In the laws of Menu we read:

"Woman during her infancy depends upon her father; during her youth upon her husband; when her husband is dead, upon her sons; if she has no son, on the nearest relative of her husband, for a woman ought never to govern herself according to her own will" (*Laws of Menu*, v. 147, 148).

This was true in Rome as well as India. A mother need not be asked to consent to the marriage of her only daughter. This position was true only of marriage by *confarreatio*. In *usus* and *coemptio* she had more rights; it was more of a bargain. The Roman matron, however, had dignity if not power. She was addressed as *materfamilias*, as her husband *paterfamilias*. She pronounced to her husband on entering his household "*Ubi tu Catus, ego Caia*," implying equality in dignity. She was the object of veneration. She had her place near the sacred fire. On her death her husband lost his place as priest. Her position was often happy. Cato thought it better "to be a good husband than a great senator" (Mommsen's History, III., chap. 13). It was said to be 500 years after the foundation of the city before the first divorce occurred. This was the divorce of his wife by Carvilius Ruga, B.C. 234, on account of sterility, and for his oath's sake, tho "he loved her tenderly" (*Aulus Gellius*, IV., 3). After the Punic wars a change set in. Sylla, Cæsar, Antony, and Augustus repudiated their wives. Divorce was a religious form, not a civil one. The disintegration and immorality that set in under the empire are well known. (See CHRISTIANITY AND SOCIAL REFORM.) Men and women outdid each other in wanton indulgences. Seneca says that marriage was contracted to give piquancy to adultery (*De Benef.*, III., 16, 2,3). Friends exchanged wives. Yet there were brilliant exceptions—Cornelia, the

devoted wife of Pompey; Marcia, the friend, and Helvia, the mother of Seneca. Augustus tried to encourage marriage by offering rewards for the married, and decrees against the unmarried, but it availed not. Rome was rotten to the core.

IV. THE FAMILY IN EARLY CHRISTIANITY.

The conception of marriage as a lifelong union of one man with one woman, and that outside of this any sexual relation is sinful, came in with Christianity. The Hebrew family was Semitic and had tolerated polygamy, tho after the captivity it was little practised, and woman had much influence. (Cf. Miriam, Deborah, Jael, Jezebel, Athaliah.) The Greeks honored the *hetairai*. The Romans allowed many forms of marriage. The Germans allowed their princes many wives. Christianity knows but one wife for one husband, and that while life lasts, save for the one cause of fornication. So Christ taught (Matt. xix. 9). For man and woman there is but one standard. Purity is to be of the heart. He "who looketh on a woman to lust after her hath committed adultery with her already in his heart" (Matt. v. 28). Christianity does not give detailed enactment. It elevates the whole conception of woman and of marriage to a spiritual plane. Christ gives the same authority and power to the mother as the father. The two are equal and the two are one. St. Paul seems to have had a lower idea of woman. He says more than once, "For the husband is the head of the wife, even as Christ is the head of the Church" (Eph. v. 23). He com-

The New Testament.

mands wives to be subject "to their own husbands in everything" (Eph. v. 24). Celibacy is held to be better than marriage, tho marriage may be allowed to prevent fornication (1 Cor. vii. 2). Yet he and all the writers of the Epistles and Revelation elevate marriage by making it the symbol of the relation of Christ to the Church. The Church is continually spoken of as the bride of the Lamb. Chastity is held very high through all the early Christian centuries. (See CHURCH AND SOCIAL REFORM.) "The chaste woman," says the Clementine homilies (Clark's *Ante-Nicene Christian Library*, pp. 220,221), "is adorned with the Son of God as with a bridegroom. She is clothed with holy light. Her beauty lies in a well-regulated soul, and she is fragrant with ointment, even with a good reputation. She is arrayed in beautiful vesture, even in modesty. She wears about her precious pearls, even chaste words. And she is radiant, for her mind has been brilliantly lighted up. Into a beautiful mirror does she look, for she looks into God." The husband is not forgotten: "He who wishes to have a chaste wife is also himself chaste—gives her what is due to a wife, takes his meals with her, keeps company with her, goes with her to the word that makes chaste, does not grieve her, does not rashly quarrel with her, does not make himself hateful to her, furnishes her with all the good things he can, and when he has them not he makes up the deficiency by caresses" (*ibid.* 221, 222). In the apostolical constitutions the tendency to celibacy

is beginning. Bishops, presbyters, and deacons are forbidden marriage. They need not repudiate wives, but they must not marry. Deaconesses are to be virgins or widows. The reason for this is plain—licentiousness was the prevailing sin of the times. Christianity in this corrupt age produced the home. Says Origen: "There is not a Christian community which has not been exempted from a thousand vices and a thousand passions. . . . Compared with contemporary pagans, the disciples of Christ shine like stars in the firmament" (*Contra Celsum*, L. 7, iii. 29). "Concubina" or "concubinalis" is never found on the grave of the Christian wife. In one respect only was woman's liberty narrowed by early Christianity. Under Rome woman had gained some freedom by relinquishing religious marriage and bargaining for freedom in the civil marriage. Christianity, by making marriage again religious and not civil, brought her legal position back to being under her husband again. The old law proclaimed liberty of divorce; the Christian declared marriage indissoluble. The Christian idea of the family pervaded later legislation. (See CHRISTIANITY AND SOCIAL REFORM.) It restrained the power of the parent, putting love in place of law. The freedom of the Roman matron was bought by her disgrace. If Christianity took away some of this freedom, it was by taking away her disgrace. It is for Christianity to-day to give her freedom without weakening family love. The early and medieval Church made a fearful mistake in the overpraise of celibacy,

yet almost all the Fathers do commit this error. Tertullian says **Asceticism**, celibacy must be chosen even if mankind perish. Origen thought marriage profane and impure. St. Jerome says, the marriage may fill the earth, it is virginity that replenishes heaven (Wester-marck's *History of Marriage*, pp. 154, 155). The same feeling is found in other religious writings. The Buddhist *Dhammika Sutta* say that "a wise man should avoid married life as if it were a burning pit of live coals" (Monier Williams' *Buddhism*, p. 99). Almost all savage religions, too, require celibacy of their priests and holy men and women. A Munda Kol, when asked, "May a dog sin?" answered: "If the dog did not sin how could he breed?" In all religions a veil of modesty, however transparent, is drawn over all the relation of the sexes. The need is for a true spirituality that shall not draw away from life, but shall spiritualize all of life's relations.

V. THE MEDIEVAL FAMILY.

The barbarians who invaded the empire honored woman. The family was pure. Domestic virtues prevailed. Salvian wrote in the fifth century (*De Gubernatione Dei*) of the Romans and the Christians, at this time largely infected by Roman impurity:

"You, Romans and Christians and Catholics, are defrauding your brethren, are grinding the faces of the poor, are frittering away your lives over the impure and heathenish spectacles of the amphitheater; you are wallowing in licentiousness and inebriety. The barbarians, meanwhile, heathens and heretics who they may be, and however fierce toward us, are

just and fair in their dealings with one another. The men of the same clan and following the same king love one another with true affection. The impurities of the theater are unknown among them. Many of their tribes are free from the taint of drunkenness, and among all, except the Slavs and the Huns, chastity is the rule."

Monogamy was universal save among the princes. Divorce was uncommon. Adultery was punished with great severity. Women accompanied their husbands on campaigns. The great invasions were migrations of families. The German family was a republic. Legally the position of woman, in the Germanic States, as they began to crystallize, was a mass of contradictions. One code grants her the right of inheritance; another denies it. One causes the wife practically to be sold to the husband; another causes her to come to him bringing a dowry. But however it was legally, morally woman was ever regarded as man's equal or superior. She was not confined to household cares. In battle she stood in the rear to inspire the warriors. In worship she stood near the priest, examined the entrails, and pronounced the verdict. In Iceland, which was never touched by Roman influence, a kiss forced upon woman was, in the twelfth century, punished with exile. Yet in other Germanic races woman was virtually a slave. In some she was immolated on the pyre of her husband.

As royal power arose and civilization became a war between robber barons, more and more honor was almost of necessity given to the physical power of man. Woman needed a protector. She was more and more placed under tutelage. Yet as feudalism became settled it tended to **Feudalism**, develop the family. The lord, marked off from his dependents, was more forced to seek equal comradeship with the few who were his feudal equals—his family. It tended to develop the individual family. It tended, too, to put the family on terms of equality. The children, and especially the eldest son, were more honored. This developed the aristocratic pride of family. But this lowered the condition of the dependent family. The lord often lorded it over the family of his serf. The legal recognition of the *jus primæ noctis* has been denied; but in practice the lord undoubtedly, by might if not by right, claimed the body of the female serf. His serfs could not marry without his will.

When feudalism gradually disappeared the tutelage of woman was continued by habit and legal custom. Chivalry, however, honored the woman as a jewel to be guarded, and a queen to be served and almost worshiped. Knights swore "to fear, revere, and serve God religiously; to forward the faith with all their strength, and to die a thousand deaths rather than renounce Christianity; to maintain the just cause of the weak, such as of widows, orphans, and maidens, in a good quarrel; to expose themselves for them according as necessity required, **Chivalry**, provided it was not against their own honor, or against their king or natural prince; that avarice, recompense, gain, or profit should never oblige them to do any action, but only glory and virtue; that they

would hold themselves bound to conduct a lady or maiden ; that they would serve her, protect her, and save her from all danger and all insult, or die in the attempt ; that they would never do violence to ladies or maidens, altho they had gained them by arms, without their will or consent ; that, above all things, they would be faithful, humble, and would never fail in their word, for any ill or loss that might thence happen to them" (Guizot's *History of Civilization*, IV., 22-24). In Southern Europe the vices of the Roman Empire had more endurance. The home was degraded ; woman an inferior. This was encouraged and woman corrupted by the growing corruption of the priests with their enforced celibacy. Beginning first as a protest against the licentiousness of the Roman Empire, the Church praised first purity, then virginity, then celibacy. Marriage was allowed to prevent fornication and as a concession to the flesh. This degraded it. The Manichean doctrine spread, that the body was evil and must be crucified with its desires. Eustathius, Bishop of Sebastia, before the close of the fourth century, asserted that the married cannot be saved, and prayers must not be offered in their houses (Lea's *Historical Sketch of Sacerdotal Celibacy*, p. 61). About the year 385 the first definite rule was issued commanding perpetual celibacy for the clergy. The rise of monachism hurt the family. Down to the Protestant Reformation the monk and the nun were held up as "the religious." Every kind of concubinage was practised, tho the councils thundered against it. Occasionally the Church in despair seemed to surrender and allow concubinage. Convents became brothels. The love of Abelard and Heloise is indicative :

"In a worldly point of view, it was better for him, as a churchman, to have the reputation of shameless immorality than that of a loving and pious husband ; and this was so evidently a matter of course, that she willingly sacrificed everything, and practised every deceit, that he might be considered a reckless libertine, who had refused her the only reparation in his power" (Lea's *Historical Sketch of Sacerdotal Celibacy*, p. 283).

The Church, with exceptions, yet too few, became grossly corrupt. Cardinal Hugo said to the people of Lyons, on the occasion of the departure of Innocent IV. (1251), after a residence of eight years :

"Friends, since our arrival here we have done much for your city. When we came, we found here three or four brothels. We leave behind us but one. We must own, however, that it extends without interruption from the eastern to the western gate" (Lea, p. 356).

Asceticism was as a rule only apparent. Says Cæsar of Heisterbach (*Dial. Mirac. Dist. XII.*, chap. xix.) :

"Since the priesthood mostly lead evil and incontinent lives, they soothe rather than excite the consciences of the worldly."

A bull of Alexander IV. (1259) declares that the people, instead of being reformed, are actually corrupted by their ministers. Marriage, it is true, was regarded as a sacrament, but the degradation of marriage as a carnal indulgence was more potent. The Church degradation of marriage led to its degraded sense of woman.

This was voiced in the canon law. Woman was regarded as the means of man's fall. Man is above her, between her and God. In all respects relative to the condition of woman, the canon law copied Roman law.

VI. THE FAMILY IN MODERN TIMES.

It has been a favorite charge of Roman Catholics that the Protestant Church was founded upon lust : in England, upon the unholy passion of the king ; on the Continent, upon the broken vows of a monk and nun. The truth simply is that one of the first blows struck by the Reformers was against the enforced celibacy of the clergy ; a rule which Luther characterized as angelic in appearance, but devilish in reality. The importance of this step was enormous. The enthusiasm with which the common people greeted this step was a proof of the evil of an unmarried clergy. The Romish Church, while not allowing divorce, reserved for itself the right of pronouncing marriages between relatives, within a marvelously ingenious and complicated system of prohibited decrees, as null and void from the beginning. Dispensations, too, were allowed princes and nobles. The mass of the people were left to endure the burden of evils growing out of the sacramental theory of marriage. In demanding impossible virtues, the Church opened wide the doors for all possible vices. Luther allowed divorce on the ground of adultery only ; Zwingli and the Zurich ordinances for other grave reasons. Calvin took substantially the same position as Luther. Luther even allowed Philip the Magnanimous, of Hesse, for political reason, to marry two women. The English Church, as she had never been wholly under the control of Rome, was less changed, there being less to change. Enforced celibacy, however, was voted down in convocation by a vote of 53 to 22 in 1547, and marriage as a sacrament was rejected. The Puritans, revolting against the Established Church, denounced the right of the priest to marry, and declared marriage a civil contract. This was confirmed by the New England Puritans. John Robinson says : "We cannot assent to the received opinion and practice answerable in the reformed churches by which the pastors thereof do celebrate marriage publicly and by virtue of their office" (*Apology*, 45). A law of Plymouth Colony (1633) required magistrates to legalize marriages. It was doubtful, however, how far the people approved of this. In 1692 the Massachusetts Province laws provided that marriage ceremonies might be performed by ministers, and this has become the rule in New England ; but the minister performs the marriage, as far as the State is concerned, not in his capacity as a minister, but as a civil officer, duly authorized by the State. The Church of England, as well as of Rome, is averse to this theory—that marriage is a civil contract—and has thus far successfully resisted the tendency to the complete secularization of marriage in England ; but on the Continent it has grown rapidly with the waning power of Rome. All Protestant sects tend to look upon adultery as the only cause for

**Prot-
estantism.**

divorce, while Rome, still holding marriage to be a sacrament, allows separation, but holds that the bond, once formed, is dissoluble only by death.

Other influences have been at work in modern times upon the family. The Protestant Reformation, with its emphasis upon individualism, has steadily tended to exalt the individual above the family. Says Sir

Indi-
vidualism.

Henry Maine (*Ancient Law*, pp. 163, 165):

"The movement of the progressive societies has been uniform in one respect. Through all its course it has been distinguished by the gradual dissolution of family dependency and the growth of individual obligation in its place. The individual is steadily substituted for the family, as the unit of which civil laws take account. . . . We may say that the movement of the progressive societies has hitherto been a movement from status to contract."

Such has been the legal effect of the Reformation upon the family. The family is less the social unit, and less and less so as liberalism prevails. In England the Conservative Party is said to be made up of those who have strong "family" affiliations. In regard to property, the old common law gave all property to the husband, and tho this has been steadily modified, great injustices are yet done to woman in the name of law. (See WOMAN'S RIGHTS.) Protestantism, however, while it has tended to exalt the individual over the family, and to give the woman a standing at least more equal with the man, cannot as yet be accused of having hurt the family life. Nowhere in the world has there been purer family life than in Protestant Germany, England, Scotland, and America. The Protestant home has been its proudest gem. Many Protestant countries can say of its homes what Burns says of Scotland's:

"From scenes like these old Scotia's grandeur springs.
That makes her loved at home, revered abroad."

Yet equally undoubtedly a change has come. (For the full discussion of the facts of the modern weakening of the marriage tie, see DIVORCE.) But the increase of divorce is one of the best recognized, because most apparent, of modern facts. It is shown by the National

Department of Labor (*Report on Divorce. Marriage and Divorce*, p. 140) that divorces have increased in the United States within the twenty

years before the report more than twice as fast as the population. And this is perhaps quite as much a symptom as the cause of the decay of the family. A publication of the National Divorce Reform League for 1893 says:

"We might spend much of our time on the evils that beset the family, for they are many and serious. But brief mention of a few is enough. Some destroy the very constitution of the family; others impair its environment. We name the enormous number and increase of divorces; the apparent decrease of marriages and the haste and ignorance that mark many unions; the prevalence of sexual vice, with the low ideals of sex that lead to it; and insensibility to the sacred obligations of paternity. Then there are the open or more subtle influences that make our civilization almost the direct foe of the home. We point to the methods of business involving absence from home, the system of commercial travelers and the operation of the industrial system as a whole, which tends to separate the household in both business and labor into its constituent individuals. These have greatly disturbed the relation of the centripetal and centrifugal

forces of the home and society. Then, again, the solidarity of domestic interest is weakened by other competitors. There are the fascinations of shopping, the waste of time over mere social 'fads,' and the increasing resort on the part of women to clubs and social frivolities among themselves, for which the neglect and absence of men are in great degree responsible; and even the noble desire for honest intellectual improvement and for charitable work have made inroads upon the home."

More open evidences of social corruption exist. (For details as to the extent of prostitution in this and other countries, see PROSTITUTION.) Evidence is not wanting of the increase of impurity in the sexual relation among factory populations. The development of the tenement population is itself an indication of the decay of the family. In New York City 80 per cent. of the population are said to live in tenements.

According to the *Report of the Massachusetts Bureau of Statistics of Labor for 1892*, 67 per cent. of the population of Boston live in rented houses. Only 33 per cent. live in their own homes, and even this is too hopeful a showing, because of these 33 per cent., certainly some live in mortgaged homes that they can scarcely be said to own.

There is a more threatening fact than this. 67 per cent. occupy rented houses, but only 15 per cent. live in single tenements; 52 per cent. crowd together in tenements occupied by two or more families (*Report of 1892*). This is for the whole city. In certain wards the statistics are still more appalling. They may be said to be "wards without a home." Of the distinctively so-called "working class" we have no recent separate statistics, but in 1876, of 55,515 male wage employees in Massachusetts, being the number which made reliable returns, during the extraordinary census of the preceding year, concerning their owning or hiring the houses in which they lived, only 23 per cent. owned their residence, and 44½ per cent. of these were encumbered with mortgages, leaving only about 12 per cent. of the whole number who made returns in the full possession of a home.

What this means there is no need of describing. (For its significance to the family, see TENEMENT LIFE.) The evidences exist on every hand that the preservation of the family is a most pressing, if not the most pressing, problem in modern practical sociology. We therefore pass to consider

VII. THE SOCIOLOGIC FUNCTION OF THE FAMILY.

Save for a few extreme radicals, who would abolish the family, and whose position we shall consider later, all sociologists find in the family the social unit, the keystone of society. Says Professor H. B. Adams, as quoted by Dr. Dike in his address before the Evangelical Alliance, Washington, D. C., December 8, 1887:

"The family, oldest of institutions, perpetually reproduces the ethical history of man, and continually reconstructs the constitution of society. All students of sociology should grasp this radical truth, and should also remember that the school and college, town and city, State and nation are, after all, but modified types of family institutions, and that a study of the individual elements of social and political life is a true method of advancing sociology and politics in general."

Says Dr. S. W. Dike himself in the same address:

"I do not fear contradiction from any competent scholar in political science when I say that the study of the single family on its homestead would yield richer scientific knowledge and more practical results in the great social sciences than almost any other single object in the social world. Pursued historically, the student would find himself at the roots of property, separate ownership of land, inheritance, rent, taxation, free trade, and tariff, and discover the germs of international law and the State. The great questions of the day, as we call them, are little more than incidents to the working of the great social institutions; and these, we have already seen, are the expansions and modified forms of the family, amid its unceasing support and activity. 'Sociology,' the late Dr. Mulford used to say, 'is the coming science, and the family holds the key to it.' 'The family,' he also wrote, 'is the most important question that has come before the American people since the war.'"

Mr. Gladstone wrote in the *Nineteenth Century* for February, 1890:

"The greatest and deepest of all human controversies is the marriage controversy. It appears to be surging up on all sides around us. . . . It is in America that, from whatever cause, this controversy has reached a stage of development more advanced than elsewhere."

What, then, is definitely the sociologic function of the family which gives it such extreme importance?

I. It furnishes the two elements which undoubtedly contribute more than any other to the development of all human life in the world—*viz.*, heredity and environment during the formative period of life. Biologists may discuss which of these most affects character—heredity or early environment; but all are agreed, whichever of these is the more powerful, that together these form the two most potent influences, and that the family controls or may control both. "The best way to become good," it has been well said, "is to be born good." Out of 5511 convicts at Elmira Reformatory (*q.v.*) 38 per cent. had parents known to be intemperate, and 13 per cent. more of doubtful habits; 81 per cent. had parents not possessing property; 44 per cent. had parents of little or no education. The power of home in childhood is equally evident. Of these same 5511 convicts, 54 per cent. came from bad homes, 38 per cent. more from homes "only fair;" not more than 6 per cent. came from homes that were good; 42 per cent. were homeless when committed; 97 per cent. came from bad associations. "As the twig is bent the tree grows."

The Home. "A child's first teacher is the one who first loves it;" and usually this is the mother. It is, then, the first duty of the family to see that the child is well born, and, secondly, well nurtured. These conditions are largely personal and individual, moral and physiological, rather than sociological, and so do not fall within our province in this article. Who does not know that pure parents, pure generation, pure conception, pure pregnancy are of infinite importance to pure birth? So with mental, moral, and physical health in every form. To see that the child that is born has this is, then, the first sociological function of the family. This implies, however, and necessitates pure marriage; so that the marriage of those mentally, morally, or physically incapacitated to beget healthy children is a sociologic sin. Says Professor Jowett, in his introduction to Plato's *Republic* (1st ed., vol. ii., 130-132):

"The late Dr. Combe is said by his biographer to

have resisted the temptation to marriage, because he knew that he was subject to hereditary consumption. This little fact suggests the reflection that one person in a thousand did from a sense of duty what the other nine hundred and ninety-nine ought to have done."

II. But purely and healthfully born, it is, second, the function of the family to see that the child is rightly reared. Its first duty in this line is undoubtedly to see that it is reared in an atmosphere of love. The first duty of parents is to love each other and their offspring. Theology would teach that this love must be love of God and man; but sociology at least says that they must love each other. Here most literally love is **Training.**

Who can deny or doubt the infinite and irreparable loss of a childhood reared in an atmosphere without love? It is this loss which as we shall say is sociologically the unanswerable argument for all social schemes, that would take away the child from the mother or father. Of the nurture of the child in health and in education, ethical and moral, as well as intellectual and physical, we cannot here speak, but it suggests itself. The truest education a child receives is in its home, whether that home be a palace or a city alley. Therefore, as for other reasons, the frightful significance of the disappearance of the real home in large sections of our cities and growing portions of our population. (See *DIVORCE*; *TENEMENT LIFE*; *SLUMS*, etc.)

III. But this is by no means the only function of the family. It is, thirdly, the function of the family to furnish all through life the necessary atmosphere of love and peace to the individual. It is not necessary that every one should be married. It is necessary to the highest life that every one should have at some portion at least of adult life, as well as in childhood, the joy and peace of life in the family. "It is not good that **Law of Sex.** the man should be alone" is the voice of sociology as well as of God.

Man is born sexed. Man is created male and female. This is the fact, whoever and whatever is the Creator. And the law of sex runs through all the universe, mental and moral, as well as physical. For the development of this, see **MARRIAGE**; we simply state it here. It is the function of the family to furnish men and women with the opportunity for the carrying out of this sex life, mental and moral, even more than physical. Man without woman, or woman without man, is a biological and sociological abnormality. It indicates an abnormal condition in society when it is found that 20 per cent. of the women of England and 44 per cent. of the population of Belgium, with about 33 per cent. in Europe, in 1875, are unwedded; and when we read the startling statistics of the decrease of marriages in modern civilization. (See **DIVORCE**.) It is to the shame of modern science that thus far this subject has been left almost completely untreated from the standpoint of science, and that the careful literature of the subject is so meager. Only latterly are we making a beginning of the proper development of sociology in studying the family by the collection of statistics. Says Dr. Dike, who is among the foremost students of this question in this country, in a pamphlet issued in 1890:

"It is becoming more clear that the divorce question is inseparable from the general problem of the family, and that the latter, including the former, is the real subject demanding our attention as a nation, and in ever larger ways. Until within 10 years, and it is still too true, there has been scanty recognition of the family in any of the ethical or political discussions of divorce, and comparatively little, except in the law books, of the intimate relations between the problems of marriage and divorce; while writers of neither class studied their topics as parts of the inclusive subject of the family. Indeed, the reader can go through the State constitutions, law books and ethical discussions of the past with small risk of stumbling upon any direct reference to the family. Tho the gain of recent years is marked, there is still too little apprehension of the way in which problems of divorce, marriage, polygamy, charity, children, and those of education, economics, politics and religion merge in those of the family."

It may be said, as an illustration, that the *Encyclopaedia Britannica*, from which we have quoted above, while it gives 47 pages to the subject of fortifications and 101 pages to hydro-mechanics, devotes less than 10 pages to the family, and discusses absolutely nothing in those pages but the origin of the family, as if that were the sole important matter. Having, then, discovered somewhat the function of the family, we pass to ask what science teaches to be the best form of the family; and we shall consider this portion of our subject under three heads: (a) Permanent Monogamy; (b) Easy Divorce; (c) Free Love (including under this last division all forms of the family other than that based on the marriage of one woman to one man).

VIII. VARIOUS THEORIES OF THE FAMILY.

(a) THEORY OF PERMANENT MONOGAMY.

The form of the family where marriage is between one man and one woman, and indissoluble until death, save for cause of adultery or similar aggravated causes, is by many considered the only form of the family really worthy of the name. It is declared to be the best form, for the following, among other reasons:

1. That history proves it to be that form of the family best productive of the highest character, individual and national. The supporters of this argument point to the Aryan civilization; to Greece in her pure days; to Rome when she had the monogamic family and rare divorce; to the early Christian centuries, before

Advantages of Monogamy. false theories of celibacy and virginity broke up the married life; to Germany, England, Scotland, Ireland, and America, and to the individuals produced by such civilizations as compared with the polygamic civilizations of Asia and

Africa, as compared with Greece and Rome when divorce became easy, as compared even with France, Germany, England, and especially America, where divorce has been becoming more and more easy. They argue that, theory aside, facts give the palm to monogamic marriage with rare recourse to divorce.

2. It is argued that monogamic marriage without easy divorce is far better for child nurture. Easy divorce, they say, leads to broken homes and changing, shifting relations that

break up the peace and quiet and love necessary to child nurture.

3. It is argued that the possibility of easy divorce suggests its adoption; that the men or women who know they can easily obtain divorce and marry again are led to think of it, and then to lightly want it and seek it on any occasion when passing fancy for some other person prompts it, or when passing displeasure with their married partner causes a desire to change. In nine cases out of ten it is claimed that the trouble lies at least in part with both parties, and that to make a change in the marital relation would not afford relief, since one cannot obtain divorce from one's self, and that often at least one would thus seek change without finding relief; thus, to say the least, needlessly causing the breaking up of homes and perhaps the breaking of many hearts.

4. It is claimed that easy divorce makes marriage a light affair, hence lowering the sense of both its solemn responsibilities and its possibilities of unchanging and unequalled mutual confidence and joy and love. This, it is said, would make men and women enter the state of matrimony more carelessly than they do now, instead of "reverently, discreetly, advisedly, soberly, and in the fear of God."

5. It is claimed that, since sensual desire is more liable to change its object than is love, a system allowing of easy divorce and change would tend to elevate the lower elements in marriage and the family, making them matters of the bodily sexual relations rather than of the moral and spiritual relations.

6. It is claimed that easy divorce and change are repugnant and contrary to the highest ethical and moral sentiment, which demands love that does not end nor change, and that recognizes one supreme object of its love, a love which can brook no rival.

7. Lastly, but for Christians first, it is argued that any relation other than that of the union of one man with one woman, indissoluble until death save for cause of fornication, is directly contrary to the revealed will and law of God in Christ, who declared positively of the sexual relation that "for this cause shall a man leave father and mother and shall cleave to his wife, and they twain shall be one flesh;" and again, "Whosoever shall put away his wife, except it be for fornication, and shall marry another, committeth adultery, and whoso marieth her which is put away doth commit adultery."

Orthodox View.

Such are some, tho by no means all, of the main arguments for enduring, monogamic marriage. It is summed up for Christians in the appeal to the Christian ideal and the stern testimony of fact; and to non-Christians in the testimony of fact alone, that easy divorce has always resulted in a corrupt, sensualized society; while enduring monogamy has given the world the highest civilization, the happiest home, the purest family the world has known. Buttressed on this strong ground, the believer in enduring monogamy considers his position impregnable, and every step in the direction of easy divorce an assault upon the very foundation of true society.

(b) THEORY OF EASY DIVORCE.

The argument for easy divorce claims that it meets the above contention at every point. It says, admitting that thus far enduring monogamy has been best for the race, and has thus far produced the highest civilization on account of the lower elements in man's nature, which marriage laws and difficult divorce have done something to restrain, does it follow that it must always be so? Is love never to be trusted except under lock and key? Have we such reason to be satisfied with our present system? Defenders of easy divorce are never weary of calling attention to the heart-burnings, and quarrels, and dissensions of those who find themselves tied together for life, altho love may have turned to hate. They say that what they argue against is not enduring monogamic love, but against an enduring monogamic *law* compelling men and women to live together after love has fled. They argue

Unhappy Love.

that in the very name of love this is an outrage upon love. They say that all marriage, except marriage for love, is an acted farce, and that when love ends, the pretense of love should end. Enforced pretense of love, they say, when love is really gone, is the fruitful parent of innumerable ills, quarrels, hatred, cruelty, refinements of mental and moral torture, desertion, unfaithfulness, adultery, prostitution, murder. They say that, instead of being good for childhood, *enforced* monogamy, compelling children to live where only the pretense of love exists, with a reality of hatred—a condition of affairs discovered by children only too easily—is really the worst atmosphere in which childhood can be reared. They argue that, in fact, if love be left free it would be much more likely to endure than when attempted to be enforced by law, so that easy divorce would really give us more enduring true love, and only break up those sham relations, which do more harm than good. They argue that it is absurd that the most solemn relations of life should be irretrievably fixed, too often and perhaps usually, by the uneducated, and too often at least the partially impure fancy of a young man for a young woman, sometimes of an irresponsible boy for an inexperienced girl. As for reference to facts, they argue that if corruption in Greece and Rome did accompany the development of divorce, it is not proven that divorce was the cause. They say that it is far more likely that the breaking up faith in false gods, with no higher faith taking its place, at least till Christianity came, did, in a society resting on a material and slave basis, cause the outbreak of corruption, which to an extent made use of divorce, but which marriage was equally powerless to restrain. The evidence they claim is that corrupt marriage is worse than corrupt divorce. They say that in our own times the cause of growing profligacy is not growing divorce, but growing materialism and omnipresent commercialism. They point to such women as George Eliot and such men as Goethe to show that to break away from legalized relations to freer love does not weaken or debase character. Such is the main argument for easy divorce. We shall

see in a moment how it is met, but pass now to the arguments of those who carry easy divorce to the extreme of

(c) FREE LOVE.

This, it must be stated at the outset, is by no means of necessity material and animal in its motives or its character. Free love has been defended by some of the most spiritual and noble of mankind. Plato and Campanella, St. Simon and Fourier, Shelley and William Morris cannot be set aside as in their ideals "material," "animal," or "low." Professor Jowett, of Oxford, says of Plato, in his introduction to Plato's *Republic* (1st ed., vol. ii., pp. 145-147):

"First, we may observe that the relations of the sexes supposed by him are the reverse of licentious; they seem rather to aim at an impossible strictness. . . . We may allow that his conception of the relation of the sexes takes rank among the great original thoughts of mankind."

The ethical standing of free love depends on what you mean by free love. When the anarchist Spies, lecturing on anarchism before the Chicago ministers, was asked if he believed in free love, he answered, "As opposed to bought love, I do." We must therefore understand what is meant by free love before we can really discuss it, and, as a matter of fact, very different and even opposing theories of the family relation have been classed indiscriminately under this phrase. Some of these are indeed ignoble and base; others may be mistaken, but are not intentionally ignoble. We class them together in this article, altho distinguishing between them; *first*, because they are confounded in the public mind, and therefore will be looked for under this head, and the article will therefore be misleading if free love is called either unqualifiedly pure or unqualifiedly impure; *secondly*, for matter of convenience, since it would confuse to have too many heads; *thirdly and mainly*, because all these theories, good and bad alike, do have the distinguishing characteristic which passes by the name of free love; they all are opposed to the limiting *by law* of individuals to the sexual relation of one man and one woman. All that is opposed to such limitation is rightly characterized under the name of free love; altho it is equally necessary to protest against the indiscriminate condemnation of what aims to be pure with what aims at what is impure. The first duty, then, is to distinguish between theories. Let us do this. Plato, Campanella, and some extreme state socialists (tho by no means the majority of socialists) have argued that the whole matter of the begetting and rearing of children should be left in the hands of the State. Socialism, it must be remembered, is by no means committed to this, as Dr. Schäffle, who is not a socialist, and who is also of the highest authority, has testified in his *Quintessence of Socialism*. The large majority of socialists do not, as we say, accept this form of free love, but it is proposed by a few extreme worshipers of the State; and, as we have said, by Plato first and foremost. In a sense it is not free love, but, as Dr. Jowett has pointed

Various Forms of this Theory.

out, is its opposite. Still it may be characterized under this head because it would not limit the individual to the sexual relation of one man and one woman.

Plato's View. Its advocates, following Plato, would have the State or community allow or control the sexual inter-

course of men and women, only within certain limits of age and certain mental, physical, and moral qualifications. They would have children thus generated, and reared by the State, no father or mother being allowed to know their own children, that thus children may be educated equally and wisely to live for the State and not for the disrupting ties of family. Horrible as this may seem to many, it is well at least to notice that grave thinkers have found some good in it; we should at least see the weak point of modern methods and ask if we may not improve upon these without taking the dire alternative proposed by Plato and his followers. We therefore quote once more from Professor Jowett (see above), where he says :

"No one can have observed the first rising flood of the passions of youth, the difficulty of regulating them, and the effects of the whole mind and nature which follow them, the stimulus which the mere imagination gives to them, without feeling that there is something unsatisfactory in our method of treating them. That the most important influences on human life should be wholly left to chance or shrouded in mystery, and instead of being disciplined or understood, should be required to conform only to an external standard of propriety, cannot be regarded by the philosopher as a safe or satisfactory condition of human things. Nor is Plato wrong in asserting that family attachments may interfere with higher aims. If there have been those who 'to party gave up what was meant for mankind,' there have been those who to family gave up what was meant for mankind, or for their country. The cares of children, the necessity of procuring money for their support, the flatteries of the rich by the poor, the exclusiveness of caste, the pride of birth or wealth, the tendency of family life to divert men from the pursuit of the ideal or the heroic, are as lowering in our own age as in that of Plato. And if we prefer to look at the gentle influences of home, the devotion of one member of a family for the good of others, which form one side of the picture, we must not quarrel with him, or perhaps ought rather to be grateful to him, for having presented to us the reverse."

Professor Jowett also shows Plato's aim :

"The arrangements of marriage in the Republic of Plato aimed at one object only—the improvement of the race. In successive generations a great development, both of bodily and mental qualities, might be possible. The experience of animals showed that mankind could, within certain limits, receive a change of nature. And, as in animals, we should commonly select the best for breeding and destroy the others, so there must be a selection made of the human beings whose lives are worthy to be preserved."

Such was Plato's argument. If the ox in England has been bred from 400 lbs. or less to 1200 lbs. and over, and men are of more value than oxen, why not give a little attention to the breeding of men? The question is indeed pertinent, but to answer it in the affirmative it is not necessary to say that the State or law should do this. May not, nay, should not, free individuals be educated to give more thought to the responsibilities of generation? Continues Professor Jowett :

"We start back horrified from this Platonic ideal in the belief, first, that the instincts of human nature are far too strong to be crushed out in this way; secondly, that if the plan could be carried out, we should be poorly recompensed by improvements in the breed

for the loss of the best things in life. . . . That which existed on the lower level of customs Plato imagined he was raising to the higher level of nature and reason; while, from the modern and Christian point of view, we regard him as sanctioning murder and destroying the first principles of morality. . . . There is no sentiment or imagination in the connections which they [Plato's men and women] are supposed to form; human nature is reduced as nearly as possible to the level of the animals, neither exalting to heaven nor yet abusing and over-indulging the natural instincts. All that world of poetry and fancy which the passion of love has called forth in modern literature and romance would have been banished by Plato."

It is thus not hard to see the obvious defects and the outrageous ethics of Plato's proposition. The only question is whether we cannot get some of the ends he aimed at—the begetting and rearing of better men without adopting his revolting methods. As Dr. Jowett says :

"We cannot deny that Christianity or any other form of religion and society has not been able to cope with this greatest and most difficult of social problems." We need not, therefore, say that the present method cannot be improved, because we decline to call an improvement the proposition of Plato and his modern successors in Campanella, and such rigid State socialists as Babeuf and his fellow-worshippers of mechanical and material equality.

Another form of free love, adopted not by socialists, but by some sects of so-called Christian communism, in place of the monogamic family, would have a family more or less polygamic, and with the sexual relations not left to promiscuous and thoughtless desire, but restrained, guided, and sanctified by religious precepts, instincts, and "Perfectionists." Such have been the proposals and attempts of some of the older Anabaptists in Germany, the Perfectionists of Noyes' Oneida Community, and the Mormons, with other kindred religious and semi-communistic sects. (For the details of these, see ANABAPTISTS; ONEIDA COMMUNITY; MORMONISM.) However opposed these may be in the moral sense, and however we may dissent from them, it is to be said that they are not at least outwardly moved by licentious notions. The Anabaptists of Germany certainly commenced with most religious feelings. The Oneida Community claimed to be one of spiritual Perfectionists. They declared again and again that neither their notions nor their practices were licentious. Noyes, their leader, said :

"Free love with us does *not* mean freedom to love to-day and leave to-morrow. Our communities are families as distinctly founded and separated from promiscuous society as ordinary households. The tie that binds us together is as permanent and sacred, to say the least, as that of marriage, for it is our religion. . . . Every man's care and every man's dollar of the common property is pledged for the maintenance and protection of the women and the education of the children of the community. . . . Whoever will take the trouble to follow our track from the beginning will find no forsaken women or children by the way. In this respect we claim to be in advance of marriage and common civilization. . . . We are not free-lovers in any sense that makes love less binding or responsible than it is in marriage" (*History of American Socialisms*, pp. 639, 640).

Their practice was to religiously marry all the men in their "families" or communities to all the women, and then to allow sexual intercourse between any, *but not without due consideration and consultation as to the wisdom and ethical character of the relation*. Ordinary marriage and the family led, they argued, to

family selfishness, family quarrels, and hypocrisy. "It provokes," Noyes wrote, "to secret adultery, actual or of the heart. It ties together unmatched natures. It sunders matched natures" (*idem*, p. 628). The Mormons use similar arguments and base their faith on the religious "revelations" to Joseph Smith and the polygamy allowed and recorded in the pages of the Old Testament. The heart can love, they claim, more than one person at one time. The more one loves, they say, the more one can love. Love for one wife no more interferes, according to their argument, with love of another wife than love for one sister interferes with love of another.

To these religious forms of free love, perhaps, should be added the forms proposed by St. Simon and Fourier and other doctrinaires, which, altho especially with Fourier, opposed to religion in the ordinary sense, and designed to be simply humanitarian, were advocated with a spirit virtually religious. Their theories will be found under the respective articles ST. SIMON and FOURIER; but they must be at least mentioned

here. They would have society in some form regulate marriage, and within these restrictions have wives in common, and children reared together in the most approved way.

Elective Affinities.

The modern religious sense, when once it begins to wander into new ways, seems to be easily led, as among many spiritualists, to conceiving new marital relations of "elective affinities," "spiritual wives," "heavenly marriages," etc. How far their theories are put into practice cannot be said, but undoubtedly they are penetrating society very fast. Mormonism is not the only *ism* in America that has given up belief in strict monogamic marriage. Yet many claim that the result is good. A daughter of Brigham Young has recently, in a leading magazine, described the happy homes and happy childhood of polygamous Mormons. But this is exactly where the strongest argument arises against all forms of polygamous marriage. In spite of the above article by the daughter of Brigham Young, and admitting possible exceptions, the notorious fact remains that no polygamous country or polygamous sect has begun to develop the character produced in monogamic homes. It is to England and not to Turkey, to America and not to Asia, to Kansas and not to Utah, to Brook Farm and not to Oneida, to Christianity and not to Mormonism, that one looks for the leaders of the world. The fruit of the tree of polygamy is not a justifier of the tree. Early and true Christian communism had all things in common "except our wives" (Tertullian). Of all such forms of free love President Thwing says (*The Family*, pp. 144, 145):

"The prominence that either system (sexual communism or polygamy) tends to give to the sexual nature, which should confessedly be held in subordination; the degradation in shame which it imposes on woman; the physical, intellectual, as well as moral corruption which it works in man; the misery and woe which it is obliged to place on the head of childhood; the destruction of love which is the strongest simply because its scope is the narrowest; the outrage of instincts which by natural inheritance have become the most sacred, suggest arguments against both sexual communism and polygamy. Furthermore, the equality of the number of the two sexes shows that one man was designed in marriage for one woman."

We then come to the *third* form of free love, the free love theory par excellence, which is held to-day by many socialists (not Christian), by more individualists, and by all anarchists, and an increasing number of radical men and women of various schools of thought. According to these, neither the State nor organized religion should have

Modern Free Love.

ought to do with control of the family or of the sexual relation. They would make love supreme. They would have it unfettered by any tie whatsoever. They argue that compulsory love is not love; that all marriage save from love is sin; that when love ends marriage ends. They would have (socialists by collectivism, and anarchists by free competition or cooperation) each man and each woman free to support himself or herself without any dependence upon any other individual. Then, they say, when a woman gave herself in love, it would not be for reason of family, or position, or custom, or support, or help in any way, but simply because she loved. They hold that this would produce the purest, and highest, and perhaps the most enduring love. Some of these free lovers would have the

Children.

State guarantee to every woman during pregnancy an income to keep her independent, so that she should never have to sell herself in any form or be unable to care in the most hygienic way for her child. Others would have the State care for any children that might be intrusted to it, without compelling any mother to intrust her child to its care, and without depriving either father or mother of the pleasure of knowing and often seeing the child. In this way they claim that every child would have at least the opportunity of careful nurture without the loss of parental love. Most parents, it is thought, when economic difficulties were out of the way, would *prefer* to rear their own children; only they would not be compelled to. Thus, without losing pure parental love, we should be rid of that monstrosity, compulsory love. Marriage, they claim, thus freed from control of either priest or town clerk, would be pure, and noble, and abiding. Prostitution would disappear.

That this system would work for the majority of the population under the present industrial system, the more thoughtful supporters of this view do not claim. They would have it only in connection with economic reforms that would give financial independence to every man and woman. They would also urge along with it such physical, mental, moral, and ethical education as would prevent humanity from sinking into material and animal misuse of its liberties. But they believe that humanity, once free from dependence upon priest and policeman, would rapidly prove itself capable of pure free love. At least this is the ideal toward which they believe that law and practice should tend; and for themselves and those sufficiently "advanced" they think it perfectly safe to try free love now. Whatever be their theory, the practice is certainly on the increase. The last law that they would take from love would be the law forbidding marriage below a proper age. Only when society can be trusted to prevent

this without law would they remove this law. Such is the theory of free love that is to-day most rapidly spreading. Before we answer it

let us simply add that a *fourth* form of free love should be possibly also given which has nothing ethical or pure about it, which is simple libertinism and worse than animalism, since no brutes would fall so low. But this, tho too much in practice, has no defenders to whom any honest mind need listen, and therefore needs no discussion here. The only thing is the question whether other forms of free love, however differently they may mean and may aim, would not lead to this form of free love, a fear which is answered on the part of defenders of pure free love by the question whether our present monogamic system has not already led to it, by requiring an impossible and mistaken system, the parent of vice and secret corruption. (See PROSTITUTION.)

We are now ready to see the answer that believers in enduring monogamic marriage give to all arguments for easy divorce and free love.

This is that while humanity, if it were perfect and not swayed by evil lusts, might need no laws against impure love; unfortunately humanity does need them only too much, and that in this matter we

do still need and shall for long centuries, as far as we can now see, still need, the law to prevent marriage becoming a farce, and prostitution disappearing only because society itself has become prostitution. The argument that marriage without easy divorce tends to preserve marriage after love has become hate, producing homes of dissension and hate instead of love, is an argument against the abuse of marriage, not against marriage itself. When married people find themselves or think themselves alienated, they should try to improve their married life, not try to end it. In nine cases out of ten, it is urged, people who cannot get along together in married love could not get along with any one in marriage, and therefore would make no gain by seeking divorce and new marriage. The true resource is not to change their condition, but to change themselves. The remedy against family jars is not the divorce court, but family love. It should, however, teach us to be more cautious about forming marriage alliances. In this direction there is vast room for improvement. It has been suggested that the law should go back to the old custom of requiring the publication of banns and the lapse of a certain period between the publication of the banns and the permission to marry. If, as in some countries, the difficulty of contracting marriage or obtaining divorce produces a higher rate of illegitimacy, the cure is to be sought not by lowering the laws to suit the desires, but by a spiritual and moral raising of the desires to fulfil the law. Even if the latter method should give us more technical illegitimacy for awhile, the question is whether it would not quickest give us the greatest purity. There is said to be less illegitimacy in Turkey than in England; but is it not because the Mohammedan law allows impurity? Our

aim is to be purity, not technical legitimacy. As a matter of fact, moreover, it is shown that strict marriage laws and difficult divorce do not increase illegitimacy. Alone among the States, South Carolina allows no divorce whatsoever, and yet a South Carolina judge says: "The working of this stern policy has been to the good of the people and the State in every respect" (O'Neill in *McCarty vs. McCarty*, 2 Strob. 6, 11; see Bishop, *Marriage and Divorce*, vol. i., p. 33). The Roman Catholic Church allows no divorce, and the chastity of Roman Catholic Ireland is unexampled among civilized people. In 1878 the percentage of illegitimacy was only 2.31. Germany has divorce laws much looser than England, yet has much more immorality. So, too, with the Continent generally, compared with England, Scotland, and Ireland. All the evidence seems to be that enduring monogamic marriage and strict laws, so that those who know that they enter the marital relation know, also, that they cannot readily escape, operates to produce the purest society and the happiest homes. If it does, not unfrequently, bind together ill-mated pairs, the cure lies in a higher ethical and moral life, to endure till death do part, and to learn to suffer, which often means to bring love out of, or, rather, in place of, an evil often temporary and often fancied.

IX. THE FAMILY THREATENED AND HOW TO DEFEND IT.

Having arrived at this conclusion, it is necessary to realize how severely family life is threatened, and how, therefore, it may best be defended.

First: It must be admitted that well-nigh the whole tendency at present is toward easy divorce, if not free love. This is mainly due to the individualistic tendency, from which on this point even modern socialism has not learned to differ. It came in with the Protestant Reformation, and the Puritan tendency to make marriage a civil rather than a religious matter. Says President Thwing, himself a Protestant, speaking of the destruction of the family, in the book above quoted:

"The cause underlying and in a sense including all other causes is that growth of individualism which is the direct product of the Reformation."

And again:

"The conception of marriage as a relation purely secular has been at the basis of our modern divorce legislation. This legislation recognizes the right of the individual and the right of the State to an interest in the dissolution of the marriage tie. It does not in the least recognize any peculiarly sacred character in the institution. . . . The Puritan protest against the Church of England, no less than the protest against the Church of Rome, has had its effect upon the popular conception of marriage. . . . Among the members of the Anglican or Protestant Episcopal communions the sacred altar is preferred as the place for solemnizing a marriage; and in these churches the religious idea of marriage is, no doubt, better preserved than in any other Protestant denomination" (*The Family*, pp. 158-162).

It must also be admitted that the tendency to raise the legal position of woman has been at the expense of the indissolubility of the family. Under the old law a married woman had no legal existence. As she has been granted her

Careful Marriage Laws.

just right (and there are still many rights to be granted), the law of the family has been weakened. This makes the case very intricate. To recognize the desirable absolute unity of the family, and still to recognize the equally desirable independence of both husband and wife, is not easy, but it must be done. Under socialistic forms of society, some claim it will be easier, since the holding of property will be simpler, and it is property, more than all else, that causes the legal troubles of husband and wife.

Secondly: A greater danger to the family than the tendency to individualism is the economic difficulty of maintaining the family.

Statistics given under MARRIAGE will show that a fewer and steadily

Prostitution. fewer number of young men are willing to undertake the economic burden and responsibility of maintaining a wife and children. The statistics of PROSTITUTION will show that this is taking the place of the family. The article WAGES will show that a working man's wages, even in such States as Massachusetts and Illinois, are not such as will maintain the average working man's family, and therefore his wife and children are more and more being compelled to labor, with the result of the breaking up of family life, as the article WOMAN will show. Once more, high rents and developing city life are breaking up homes and substituting tenements, as shown in Sec. 6 of this article. Such is simply a reference to economic perils to the perils that might fill volumes. Yet there are others.

Thirdly: Fashion and economic pressure are tending to divert family life from giving true care to child nurture. Births are rapidly decreasing in proportion to marriage. (See BIRTH-RATES.) Says Dr. Dike, in the address above quoted:

"The declining fruitfulness of the family—to take up the second test—especially among people of the so-called native stock, has become a matter of serious concern. In Massachusetts, the mother of foreign birth has on the average 50 per cent. more children than the mother born in this country. It is true that the death-rate among children of foreign parentage is much greater than among the others, but after all allowance for this, the parent of foreign birth rears a much larger percentage of children than the other. And notwithstanding the presence of the foreign element, the birth-rate in some of the older States is lower than in most European countries, and is steadily declining. France is the only country in Europe whose birth-rate is as low as that of Massachusetts, and France is alarmed at her condition. Massachusetts is indifferent, for she can still recruit her population from Ireland and Canada. But other States are doubtless just as badly off. No well-informed physician believes that this low birth-rate is to any great degree due to loss in reproductive powers, tho there is something in this—more, however, as effect than as cause of a declining birth-rate. In three or four sections, and these are large enough to be seriously indicative, the physicians are of the opinion that legitimate children would be 50 per cent. more numerous but for criminal deeds. This refers to all classes of people as a whole. In some of our cities, and among intelligent and even Christian people, and very widely too in rural communities, it looks as if there is a prevalent and growing intention, even at the cost, if need be, both of good morals and law, to let the inferior classes rear most of the children. Many of the families which are best fitted, so far as pecuniary means and social opportunity are concerned, are deliberately choosing to be unfruitful. And it is the testimony of gynecologists that more of their patients come from this class than from those women to whom maternity has brought its natural ills."

Even the children that are born are too often neglected by their mothers; with the rich because they can hire nurses, and with the poor because the mothers have to go out to work. In some factory towns it seems as if a crèche was needed beside every factory. It is becoming true that motherhood, and therefore family life, are disappearing. The rich will not and the poor cannot afford to rear children. The "two children" system is on the increase in America as in France.

Fourthly: The preaching of "woman's rights" is not sufficiently accompanied by a preaching of woman's duties. Women more and more board instead of keeping homes, with no duties save to misadventure themselves in selfish, idle culture or charitable "fads." Women, too, in private counting-rooms are making "the typewriter girl" disreputable. Free love is being brought down to "freer" practice.

Such are some of the perils to the family. They go so far that many radicals believe that the family, whether we like it or not, cannot be saved. They say that under the present economic system the family cannot be supported and is disappearing, and that if governments become socialistic, or if radical individualism prevail, free love will become the custom; so that in any case the family is doomed. What, then, is proposed to save it?

First: Economic changes that will make the family possible. Every working man should receive wages high enough to make it possible for him, first, to support his wife without her having to work for wages; second, to be able to own his own home in comfort and respectability. This will make the family at least possible.

Economic Reforms.

Secondly: Parenthood and wifehood and husbandhood should be preached by platform, pulpit, and press as truly as woman's rights. Especially should an equal standard for male and female purity be required.

Thirdly: Whether, with the Roman Catholics, we make marriage a sacrament or not, marriage should be considered in its deepest ethical and religious importance and not merely as a civil and much less as simply a physical contract. The radical and Protestant pulpits must learn to speak as plainly on this matter, if not in the same way, as do the Anglican and Roman churches.

Fourthly: The marriage and divorce laws of the United States must be made uniform by amending the Constitution to give Congress power to enact such laws, and then to prevail upon our Congressmen to enact such wisely. To-day our marriage laws differ most widely in different States and lead to grossest evils. A man can be married in one State, divorced in another, marry again and again, and be divorced every time. If he have issue, some of his children will be illegitimate when they live in one State, and not when they pass into another. In some States they can inherit property, and in others not. Says Dr. Dike:

"The present state of the law that regulates and protects the family is a very great source of danger. Our marriage laws are simply inadequate. Compare the legal protection of the family with that given to real estate. Every woman who owns real property finds

ample legal protection. She may have a bond for a deed. The written deed duly made out, with the as-

urance of a perfect title, signed, sealed, witnessed and fully recorded, with every transfer properly noted, so that not only those who immediately concerned, but the entire public, may know at any time the exact legal condition of every piece of real estate in the land, with laws aimed

Marriage Laws.

at protection against fraud, abuse of trust, theft, incendiarism, and other injuries—and reasonably well enforced too—these are the protections which every woman has for her property. But her hold on the family in marriage is a very different thing. In more than one third of the States and Territories a marriage is legal without a scrap of writing or a witness, or even the intervention of an official of any sort. No decent system of public record exists in many States, while very few both keep and publish these records. Where licenses are required, the mere word or the oath of an interested party is the basis of the permit, and no evidence is demanded to prove freedom from a former marriage. We have to take the people who move into our communities, and the immigrants from Europe, simply on trust in respect to their domestic ties; and this is frequently shamefully abused. And our laws protecting chastity are probably less frequently enforced than those of any other class, unless we except those in defense of the Sabbath. The legal protection of property is infinitely superior to that of the family.

"Our divorce laws are almost as various as the number of legislatures that make them. Divorces can be obtained for a dozen legal causes in some States, and they are often made elastic enough to cover every conceivable reason for divorce. They can be obtained in 2700 courts in the United States, and in some legislatures besides. These courts sit frequently, and sometimes constantly, in open court or private chambers. The procedure is often so easy that fraud is frequent; and disregard of the rights of others, haste and the eager hurry to marry another, can be readily gratified, and in some States divorce can be had by either husband or wife, almost for the asking. The conflicting marriage and divorce laws of the country have less to do with the increase of divorces than most people think, but they are a great evil in their opportunities for fraud, and in the uncertainty they give to the legal status of the married or divorced, as they pass from State to State, and of their children. And not the least of the evils is their effect on the popular ideas of what marriage and the family are."

Fifthly and lastly: If the position of those who favor enduring monogamic marriage be correct, that easy divorce results in the weakening of the family, marriage laws should be made much more strict, and divorce be granted only on ground of adultery or the most serious reason. A strong movement in this direction has been made. (See DIVORCE.) A National Divorce Reform League has been formed, with Dr. S. W. Dike as its most efficient secretary. The broadest foundation is now laid for study and action in the report of Hon. Carroll D. Wright, United States Commissioner of Labor, on *Marriage and Divorce in the United States from 1867 to 1886*. This report contains a digest of the laws on these subjects, with full tables and careful analyses of fundamental facts, together with an appendix showing the similar facts for the greater part of Europe. Congress is now asked to provide for the completion of the work thus begun and for its advance in certain other very important directions.

According to Dr. Dike, legislation has been improved. This improvement began in the repeal of the notorious "omnibus clause" in Connecticut and, with some restrictive legislation, in Vermont. Since 1878 many States have made changes for the better in their marriage and divorce laws, retaining nearly if not quite everything secured. Meanwhile, nothing has

been done in the other direction. This mere turn in the tide of legislation is of much value. The positive gain in several States is still more hopeful.

The problem of uniformity has come up within these years. Much has been said about it. The amendment of the Constitution of the United States in the interests of uniformity has been earnestly advocated and sometimes hotly opposed. The special subjects of divorce, marriage, and polygamy have been brought forward in succession, each apparently calling for national uniformity. At the present moment, Dr. Dike tells us, several important steps are being taken. Special committees of the American Bar Association have prepared reports on the subject to the annual meeting of the Association. The State Bar Association of New York, and perhaps others, are also at work upon this problem. The most important step toward uniformity, however, is the establishment by law of a commission of the State of New York charged with the duty of engaging other States in its plan of uniformity, if found practicable, through concurrent State legislation. Legislation on these subjects has had much attention in some European countries and in Canada and Australia.

The idea of the direct use of the home itself as the true starting place and a powerful agent in relief of the poor, in the removal of vice, in the prevention of vice and crime, in conversion from sin, and for the advance of knowledge, virtue, and religion, is beginning to take root in the popular mind. It finds some expression in the homes for the poor, for young men and working girls, in building associations, in the increasing attention of prison and other charitable reforms to bad home life as the source of supply for prisons and saloons. Political economy has got on so far as to treat the home seriously. The home department of the Sunday-school is another expression of the growing idea. Some pulpits have of late years taken the home into a larger place among their themes. Such is the view taken by the National Divorce Reform League.

Such signs are hopeful, but many reformers are asking if all this activity is not mainly reactionary; if the true causes of the peril to the family are not mainly economic, and that therefore if the attention of true friends of the family should not be concentrated on gaining economic changes. For such changes at present socialists, nationalists, and others are mainly working, and too frequently these are tinged with theories of free love. The evil is too deep-seated for cure by a mere purification of marriage and divorce laws. In spiritual and ethical, national and individual character most men place hope, and not in mere legislation. (See also SOCIAL PURITY, etc.)

On present conditions as to marriage and divorce, see the report of Carroll D. Wright, Commissioner of Labor, on *Marriage and Divorce* (obtainable free by writing

to the Labor Department at Washington); also the reports and publications of the National Divorce Reform League (*q. v.*).

FARMERS' ALLIANCE AND KINDRED FARMERS' ORDERS, THE.—Various national orders of somewhat similar names and almost absolutely similar character have sprung up within the last ten years among the farmers of the United States. A few of these commenced as local organizations 16 or 17 years ago. The largest, best known, and politically the most active of these, tho often called *The Farmers' Alliance*, has as its exact title, not that name, but another, *The National Farmers' Alliance and Industrial Union*. The organization that correctly bears the name the Farmers' Alliance is perhaps more general, but smaller and of less political activity.

The origin of all these orders lies in the depressed condition of the agricultural classes, which has compelled them to agitate and organize for their own protection, if not for their salvation. (For an account of this, see FARMERS' MOVEMENT.) In a sense, the parent of all these orders is the Grange, or Order of Patrons of Husbandry, founded in 1867; but as this is a much older organization, and has pursued a wholly different policy, we consider it separately. (See GRANGE.)

The first organization bearing the name Farmers' Alliance seems to have been organized by W. T. Baggett in Lampasas County, Tex., in 1876, for the purpose of opposing the spoliation of the public lands and the bringing to justice of land and cattle thieves. It did not endure, but the idea spread, and in 1879 Mr. Baggett organized an alliance in Parker County, and the same year a State Farmers' Alliance was effected. By 1886, 84 counties were represented, and the following platform adopted:

"1. To labor for the education of the agricultural classes, in the science of economical government, in a strictly non-partisan spirit.

"2. To endorse the motto, 'In things essential, unity; and in all things, charity.'

"3. To develop a better state, mentally, morally, socially, and financially.

"4. To create a better understanding for sustaining civil officers in maintaining law and order.

"5. To constantly strive to secure entire harmony and good-will among all mankind, and brotherly love among ourselves.

"6. To suppress personal, local, sectional and national prejudices; all unhealthy rivalry and all selfish ambition."

In January, 1887, a meeting was held at Waco for the purpose of effecting a union with the Farmers' Union, an association of Louisiana farmers which had been formed March 10, 1886, at Antioch Church. The union was accomplished, and the new organization bore the name of the Farmers' Alliance and Cooperative Union of America, with C. W. McCune at its head. This new order spread rapidly in the States of Missouri, Kentucky, Tennessee, North and South Carolina, Georgia, Alabama, and Mississippi.

At that time another famous organization was operating in the States of Arkansas, Missouri, Kentucky, and Tennessee, known as the Agricultural Wheel, which began under the leadership of W. W. Tedford, at Des Arc, Prairie County, Ark., February 15, 1882. At a meeting held at Sikeston, Mo., October 12, 1887, a union of the Wheel and Alliance was effected which was completed at Meridian, Miss., December 5, 1888, the organization being called the Farmers' and Laborers' Union of America.

Up to this time the Farmers' Alliance was almost exclusively a Southern institution, a secret order with grips and passwords, but it had taken no action whatever in politics except to impress its tenets in the minds of public men. In the spring of 1877 there had been organized by Milton George, at Chicago, an organization called the National Farmers' Alliance, which in a little while had extended into the States of Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, and Dakota. This was not at first a secret order,

but held open meetings and transacted its business in public. Later, however, this was changed, and the order has now its ritual and secret work. The objects of the National Farmers' Alliance are stated to be to unite the farmers for the promotion of their interests socially, politically, and financially; to secure a just representation of the agricultural interests of the country in the national congress and State legislatures; to demand the prohibition of alien cattle and land syndicates; to oppose all forms of monopoly as being detrimental to the best interests of the public; to demand of our representatives in Congress their votes and active influence in favor of the prompt passage of such laws as will protect live-stock interests from contagious diseases; and to demand that agricultural interests shall be represented by a cabinet officer."

**National
Farmers'
Alliance.**

This organization is sometimes called the Northern Alliance. Meanwhile, still another organization, the Farmers' Mutual Benefit Association, had been organized in southern Illinois in 1887, and had extended over Illinois, Kentucky, Missouri, and Kansas. Its chief object was to resist the encroachments of monopoly.

The problem now was to unite all these movements. The first meeting of the Farmers' and Laborers' Union of America was appointed for December, 1889, at St. Louis. Meanwhile the National Farmers' Alliance appointed the same time and place for its general session, and negotiations were undertaken for the still further strengthening of the movement by the blending of the two great orders now remaining. The Alliance made three demands upon the Union, as conditions on which they would join it: (1) The name should be changed to National Farmers' Alliance and Industrial Union; (2) the word "white" should be stricken out of the qualifications for membership; (3) the question of secrecy in organization should be optional with each State. The first of these demands was granted, and the name proposed is now the official name of the "Southern" Alliance; the second was practically complied with by the new constitution; but the third was refused. The net outcome of the conference was a failure of the attempt to unite, and for this failure the question of secrecy was the sole cause. Kansas, North Dakota, and South Dakota, however, deserted the "Northern" Alliance and went over to the secret order.

A union platform was, however, adopted, and in this the order of the Knights of Labor (*q. v.*) also united. The platform was as follows:

"1. That we demand the abolition of national banks and the substitution of legal-tender treasury notes in lieu of national bank notes, issued in sufficient volume to do the business of the country on a cash system; regulating the amount needed on a per capita basis as the business interests of the country expand; and that all money issued by the Government shall be legal tender in payment of all debts, both public and private.

"2. That we demand that Congress shall pass such laws as shall effectually prevent the dealing in futures of all agricultural and mechanical productions; preserving a stringent system of procedure in trials as shall secure prompt conviction, and imposing such penalties as shall secure the most perfect compliance with the law.

"3. That we demand the free and unlimited coinage of silver.

"4. That we demand the passage of laws prohibiting the alien ownership of land, and that Congress take early steps to devise some plan to obtain all lands now owned by aliens and foreign syndicates; and that all lands now held by railroad and other corporation in excess of such as is actually used and needed by them, be reclaimed by the Government and held to actual settlers only.

"5. Believing in the doctrine of 'equal rights to all and special privileges to none,' we demand that taxa-

tion, national or State, shall not be used to build up one interest or class at the expense of another. We believe that the money of the country should be kept as much as possible in the hands of the people, and hence we demand that all revenues, national, State or county, shall be limited to the necessary expenses of the Government economically and honestly administered.

"6. That Congress Issue a sufficient amount of fractional paper currency to facilitate exchange through the medium of the United States mail.

"7. We demand that the means of communication and transportation shall be owned by and operated in the interest of the people, as is the United States postal system.

PLEDGE.

"We, the undersigned, do hereby pledge ourselves on our sacred honor as men to work for the promotion of the above principles, with the view that they may be incorporated into the law of the land; and further agree to support no man for office that will not pledge himself, if elected, to carry out these principles. We further agree to cooperate with any movement that may be inaugurated in conference by the Farmers' Alliance, Knights of Labor, and other industrial organizations looking toward these ends.

"We further agree to not divulge any of the secrets or business of the organization to any one who is not a member of the same."

The convention also endorsed the so-called sub-treasury scheme (*g.v.*).

Organization, however, still went on. The Southern Farmers' Alliance was mainly made up of the middle class, composed of small farmers and mechanics. It claimed, in 1890, 3,000,000 members, men and women. The colored farmers were now to organize under the name of *The Colored Farmers' National Alliance and Cooperative Union*. The first Colored Alliance was founded in Houston County, Texas, in December, 1886. In January, 1891, the estimated membership was 1,250,000, of which number 700,000 were adult males, and 150,000 more were males between 18 and 21 years of age. A national organization was effected in 1888, and as the organization owes its existence largely to one man—R. M. Humphrey, a white man, formerly a Baptist preacher—he was put at the head of the Alliance.

All these various alliances met together at Ocala, Fla., December, 1890, and adopted the so-called Ocala Platform, not materially different from the St. Louis platform. At this convention a strong effort was made to get the Alliance to form a new political party. The Alliance voted not to do so as an alliance, but to allow its members who wished to do so as individuals. As the result a convention was called at Cincinnati, May 20, 1891, the People's Party formed, and a platform drawn and nominations made at St. Louis, July 4, 1892.

Since the Ocala convention, the Farmers' Alliances have been virtually identified with the People's Party, but have kept up their separate organizations, have held their various meetings, and different organizations among them have voted to favor various cooperative educational and industrial schemes, such as cooperative railroads, etc. Little, however, has been accomplished in this line; but an enormous amount of political agitation has been carried on.

A national reform press has been organized, including about 1000 newspapers pledged to support the demands of the farmers' movement. There are a few dailies, but the most are week-

lies. The circulation of many of these newspapers is 10,000; some reach 50,000—one perhaps 100,000. These are scattered over the whole country, and their influence cannot but be great. Besides these reform papers, there is the agricultural press, an instrument of educational force not only in matters relating to agriculture, but also in subjects of political and economic science.

The National Farmers' Alliance and Industrial Union still exists, but its main strength has passed into the political movement. (See *PEOPLE'S PARTY*; *SILVER*.)

The National Farmers' Alliance (separate from the above) represents State alliances in Iowa, Nebraska, North Dakota, South Dakota, Washington, Montana, Missouri, Minnesota, Wisconsin, Illinois, Indiana, Ohio, Pennsylvania, and New York.

The following resolutions were adopted by the National Alliance at the fifteenth annual meeting, held at Chicago, Ill., January 15, 1895:

"Whereas, the farmers of the United States outnumber any other class of citizens, furnish three-fourths of the commerce of the country, and the largest proportion of our export trade, and are compelled to pay the lion's share of the taxes of the country, and have always been loyal and faithful to the Government in time of war as well as in peace; and,

"Whereas, we recognize the supremacy of law, the necessity of being subject to the same, and of having persons duly authorized to frame and enact them; and,

"Whereas, we believe the people to be sovereign and the public officials are the servants of the people; and,

"Whereas, that the evils that now confront the farmer are the result of unfriendly legislation to the interest of agriculture; therefore, be it

Resolved, (1) We demand in our monetary system a regular and equitable distribution independent of selfish and greedy combinations, free from private manipulations, with stability as well as flexibility, and value as well as volume. (2) We demand that taxation, State, National, or municipal, shall not be used to build up one interest at the expense of another. (3) We demand the nationalization of the means of transportation and communication to the extent that the State and Interstate commerce laws shall be made mutually cooperative and harmonious for the strict and absolute control of the same in the interest of the people; that the pooling clause of the Interstate commerce law should be retained, as it promotes that healthy competition which tends to reduce freight charges to a minimum, while pooling sustains them at the maximum. (4) That the National Farmers' Alliance will adhere to the principles set forth in our declaration of purposes, and maintain the order as the opponent of unjust trusts and combines, and favor the education of our membership in political sentiment, in harmony with our principles, controlling no political party and being controlled by none, but each individual may use his own judgment in the exercise of his right of franchise and in his choice of methods by which our demands may be secured. (5) That we recommend to the Alliance the progressive reading course for farmers, and the same be under full control of an advisory committee of the various organizations of the farmers, agricultural colleges, and experimental stations. (6) That a restricted franchise has ever been an instrument of oppression; that the right of elective franchise should be exercised without regard to sex, and there should be equal pay for equal work. (7) That the anti-option bill now pending in the United States Senate should be enacted into law. (8) That we favor such strict legislation, both State and National, as will prohibit the adulteration of all food products.

References: See *FARMERS' MOVEMENT*.

FARMERS' MOVEMENT, THE.—The farmers' movement that has taken place in the United States in recent years is due to the depressed condition prevailing among the farming population in all sections of the United States,

but particularly in the West and South, the portions of the country most purely dependent upon agriculture. This depression has taken the form of an increase of

Causes.

farm mortgages coupled with a very marked fall in agricultural prices, making it increasingly difficult for the farmer to meet the payments on his mortgage. (For a full study of these, see MORTGAGES; PRICES.) It is sufficient to state here that, according to Extra Bulletin 98, of the 4,767,179 farm families of the United States in 1890, 34 per cent. were tenant farmers, 19 per cent. owned mortgaged farms, and 47 per cent. owned farms unincumbered. On the owned farms, the mortgage indebtedness is \$1,085,995,960, which is 35.55 per cent. of their value, and bears interest at an average of 7.07 per cent. The percentage of incumbered farms was, for the United States, 47; Kansas, 30; Iowa, 32;

New Jersey and Mississippi, 34; Nebraska, Delaware, and South Carolina, 35; South Dakota, 39; and at the other extreme, Oklahoma, 95; Utah and New Mexico, 85; Arizona and Idaho, 74; Montana, 73; Maine, 71. According to the abstract of the eleventh census (p. 97), farms cultivated by their owners increased 9.56 per cent.; rented farms, 41.04 per cent., and farms rented for a share in the product, 19.65 per cent. In the North Central division farms cultivated by their owners increased less than 1 per cent., while rented farms increased nearly 66 per cent. In the North Atlantic division, rented farms increased only about 6 per cent., while farms cultivated by their owners actually diminished. The farmers thus complain that they are losing possession of their farms and becoming tenant farmers. The farms, too, are depreciating in value in proportion to the wealth of the country very rapidly.

VALUATION OF FARMS IN THOUSANDS OF DOLLARS.*

	1850.	1860.	1870.	1880.	1890.
Land and Buildings.....	\$3,271,000	\$6,645,000	\$9,262,000	\$10,197,000	\$13,279,000
Implements.....	151,000	246,000	336,000	406,000	494,000
Live Stock.....	544,000	1,089,000	1,525,000	1,500,000	2,208,000
Total.....	\$3,966,000	\$7,980,000	\$11,123,000	\$12,103,000	\$15,981,000
Wealth of United States.....	\$7,135,000	\$16,159,000	\$30,068,000	\$43,642,000	\$65,037,000

* From abstract of the eleventh census, p. 99.

† From statistical abstract (1894), p. 373.

That is, in 1850 the farmers owned considerably over half the wealth of the United States; in 1860, nearly one half; in 1870, little over one third; in 1880, over one quarter; in 1890, considerably less than one quarter.

The heaviest burden upon the farmers, how-

ever, has been in the fall of agricultural prices. According to a table based upon quotations from government reports and prepared by Mr. G. B. Waldron for *The Voice* for April 11, 1895, the following has been the fall in agricultural prices by decades. (For full tables of prices, see PRICES.)

CALENDAR YEAR.	AVERAGE ANNUAL WHOLESALE PRICES IN NEW YORK CITY MARKETS.								RELATIVE COMBINED AVERAGE OF THE NINE PRODUCTS IN—			
	Wheat, per Bush.	Rye, per Bushel.	Oats, per Bushel.	Corn, per Bushel.	Upland Cotton, per lb.	Refining Sugar, per lb.	Kentucky Leaf Tobacco, per lb.	Fresh Beef, per 100 lbs.	Fresh Pork, per 100 lbs.	Currency.	Gold.	Silver.
1850-59.....	1.568	.912	.479	.764	.109	.082	.092	5.365	5.552	101.8	101.8	99.0
1860-69.....	1.901	1.098	.652	.991	.439	.112	.145	7.634	7.675	184.4	130.6	126.2
1870-79.....	1.428	.882	.511	.694	.156	.083	.103	6.583	6.096	109.0	98.9	102.3
1880-89.....	1.050	.736	.407	.575	.108	.063	.092	5.840	5.628	89.1	89.1	109.3
1890-94.....	.867	.697	.369	.547	.086	.039	.095	5.368	5.286	80.9	80.9	124.7

Says Mr. Waldron :

"The combined average price of all the products quoted cannot be obtained by making a simple average of the nine percentages for each year, since this would give to rye, sugar, and tobacco, each representing less than 2 per cent. of the total value of the crops,

the same importance as wheat, cotton, corn, and meats, which represent from 11.5 to 37.5 per cent. of the total value of the crops.

"In the small table which follows, the total farm values of these crops are given for each of the four census years 1860, 1870, 1880, 1890, and the percentage of each crop to the total value of the crop for that year :

FARM PRODUCTS.	TOTAL FARM VALUES FOR CENSUS YEARS.				PERCENTAGE OF EACH CROP TO THE TOTAL VALUE.			
	1860.	1870.	1880.	1890.	1860.	1870.	1880.	1890.
Wheat.....	\$124,635,545	\$270,768,634	\$436,968,463	\$342,497,707	11.5	14.6	18.0	14.7
Rye	10,972,718	16,428,150	14,992,686	\$16,721,869	1.0	0.9	0.6	0.7
Oats.....	43,160,796	134,283,007	146,829,240	171,781,008	3.9	7.2	6.1	7.2
Corn.....	360,680,878	572,991,245	694,818,304	597,918,249	33.2	30.9	28.7	24.9
Cotton.....	*211,516,625	*303,600,000	*271,636,121	*308,424,271	19.5	16.4	11.3	12.9
Sugar.....	†14,000,000	†10,500,000	†13,800,000	†16,000,000	1.3	0.6	0.6	0.7
Tobacco.....	‡21,719,473	‡30,749,935	‡38,758,215	‡43,666,665	2.0	1.7	1.6	1.4
Meat	‡200,000,000	‡151,000,000	‡300,000,000	‡900,000,000	27.6	27.7	33.1	37.5
Total.....	\$1,086,677,035	\$1,854,311,071	\$2,417,803,029	\$2,397,004,349	100.0	100.0	100.0	100.0

* Estimated by the Department of Agriculture from the movements of cotton for those years.
 † Estimated by *The Voice* from statistics of the Department of Agriculture and data furnished by Messrs. Willitt and Gray, of New York City.
 ‡ Estimated by the Department of Agriculture from the reports of farm animals.
 § Crop of the preceding year.

"This indicates the weight that should be given to each farm product to obtain a combined average price.

"The prices in gold and in currency coincide except for the years from 1862-78, when gold was at a premium as measured in currency. Following the average annual premiums of gold for these years as given in the *American Almanac* for 1878, the average gold prices of the table were obtained.

"The prices in silver are based upon the average London price of silver for each year of the series as given in the report of the director of the mint."

The cause of this fall in prices we cannot here discuss. (See SILVER; MONOMETALLISM.) A large part of the Western and Southern farmers, however, believe it is due to a contraction of the currency (*q.v.*), and particularly to the demonetization of silver in 1873, and a "conspiracy" of the gold kings of the world. Be this as it may, of the fact of the fall of agricultural prices and its effect upon the farming population there can be no question. The above figures speak for themselves; but we append a few significant quotations. Says the Rev. Washington Gladden, D.D. (*Forum*, vol. x., p. 315):

"The American farmer is steadily losing ground. His burdens are heavier every year and his gains are more meager; he is beginning to fear that he may be sinking into a servile condition. He has waited long for the redress of his grievances; he purposes to wait no longer. Whatever he can do by social combinations, or by united political action, to remove the disabilities under which he is suffering, he intends to do at once and with all his might. There is no doubt at all that the farmers of this country are tremendously in earnest just now, and they have reason to be. Beyond question they are suffering sorely. The business of farming has become, for some reasons, extremely unprofitable. With the hardest work and with the sharpest economy, the average farmer is unable to make both ends meet; every year closes with debt, and the mortgage grows till it devours the land. The labor bureau of Connecticut has shown, by an investigation of 603 representative farms, that the average annual reward of the farm proprietor of that State, for his expenditure of muscle and brain, is \$181.31, while the average annual wages of the ordinary hired man is \$386.36. Even if the price of board must come out of the hired man's stipend, it still leaves him a long way ahead of his employer. In Massachusetts the case is a little better; the average farmer makes \$326.49, while his hired man gets \$345."

Says Professor C. S. Walker, of the Massachusetts Agricultural College (*Andover Review*, August, 1890, pp. 129-33):

"The farmer trades provisions and raw material for manufactures and for money. The manufactures

and the money, which are the stock in trade of the city, are commodities which are easily controlled by their owners, who, readily combining among themselves, can sell or hoard very much as they please; they sell when they choose to sell, and succeed to a greater or less extent in fixing their prices. The provisions and raw material on the other hand, which are the stock in trade of the country, are commodities which the farmers are compelled to throw upon the market all at once in the fall of the year, and sell at any price the city chooses to pay. The farmer must sell; he cannot help himself. The cotton and tobacco of the Southern farmer are already mortgaged, and the money-lender takes the crop as a matter of course. If there should be a few who have not mortgaged the crop, they are nevertheless in debt, and these debts must be paid. The Western farmer cannot keep his wheat, corn, and oats, his poultry, beef, and pork. He has no facilities for storage. As a consequence, every fall thousands of millions of dollars' worth of agricultural produce is thrown upon the market, enough to supply all home demand and leave a surplus of the value of \$500,000,000 for export. The American farmer, then, North, South, East, and West, is forced year after year to sell to the city his products when the market is glutted and prices are lowest. He sells at the greatest disadvantage. This, of course, leads us to infer that, when he buys, he buys at a great disadvantage. The farmer must have money to pay his taxes and his interest in the fall, but that is the very time when money, being a commodity in great demand, is very scarce and very high. With his produce forced down to the lowest price he is forced to buy money that is up to the very highest price. Again, in the spring the farmer is forced to buy seed and fertilizers, and agricultural implements and labor; he has no money with which to pay for them, although then money is cheap. He pays for them with his note, or gets trusted for them. Under such circumstances the seller has the advantage, and the farmer is forced to pay the highest price for all that he gets. So it has come to pass that year after year, spring time and autumn, the farmer sells cheap and buys dear, and buys dear and sells cheap. . . .

Burdens.

"On the other hand, the inhabitant of the city sells money and manufactured goods to the farmer in his need, when manufactured goods and money are comparatively scarce and at the highest price, in exchange for provisions and raw material when these farm products have glutted the market. With such conditions, continued year after year, it is not strange that the city should grow richer and richer and more populous and crowded, while the country grows poorer and poorer and one farm-house after another is abandoned, that city tenements may be raised story after story and sunk deeper and deeper in the earth. Especially are we not surprised at this movement when we find that the city is the place where the burdens of taxation diminish in proportion to the benefits enjoyed, while in the country the benefits enjoyed diminish as the burdens of taxation become more and more crushing. It is an acknowledged fact that the great wealth of city fortunes easily evades taxation and contributes only so much as the owners choose to appro-

priate, with the expectation of collecting in the end from some one else.

"As the American farmer has seen wealth and population concentrated in the city, he has at the same time discovered that political power has been slipping from his grasp. Before and during the war the nation turned from the perusal of the election returns of New York City to wait for the majorities that should roll up from the counties west of the Hudson; but now the vote of the metropolis settles the election. Once the public opinion of the farmer was a power in legislature and in Congress, but now the city supports a lobby at every State capitol and at Washington, which says to the constituents from the rural districts, Thus far and no farther! When every professional lobbyist is the hired man of the city, and many lawyers of influence within or without the legislative body have a retaining fee of hundreds or of thousands in their pockets, the farmer has little chance of getting his bill safely past the cordon of the opposition. The landed aristocracy of Great Britain for a long time kept their preeminence by seeing to it that the common people should have no great leader. As soon as one of their number became a power in the House of Commons, he was at once ennobled and buried in the House of Lords, where he was henceforth harmless. So during the past generation, as soon as a farmer has risen to power and influence among his fellows, he has been courted and enriched, made a stockholder in the great corporation, given a city residence, and so led at length to forget the old homestead and his brothers and sisters struggling with fate in the back districts. . . . The manufacturing, the professional, the trading classes have, as a rule, concentrated in the cities; their interests have for the most part been in common; they have easily combined; they have acquired the wealth of the nation; they have the press in their hands; they control the school, the college, and the church; they are dominant in the caucus, the political convention, the State and National legislature. When their interests come in conflict with that of the farmers, it requires little thought to discern which has of late years prevailed. One might speak of the rapid increase of tenant farming, of the numbers of alien landlords already counting their thousands of acres, of the vast tracts of land voted to railroad and other corporations, of the multiplication of mortgages, of the growth of the debtor class among agriculturists, of the condition of the black farmers of the South, of the importation of European peasants to take the abandoned farms of England, but it is hardly necessary. The fact is already too manifest that the American farmer at the close of the nineteenth century, after a hundred years of republican government, is directly confronted with the question whether or no he shall, like the tillers of the soil in the Old World, degenerate from his honorable station to the condition of the serf."

Nor does this tell the whole story. The prices at which the staple agricultural products are sold are fixed by the competition of the world. Protection does not raise the farmer's price. Says Mr. G. T. Powell, an experienced farmer of Columbia County, New York, in a report on the promotion of agriculture in New York State to the New York Association for Improving the Condition of the Poor, published by this Society, April, 1896.

"With the very great extension of railroad lines has come a steadily decreased cost in freight rates, especially to the producers farthest removed from markets. In 1870 freight on a bushel of wheat from Chicago to New York by rail was 30 cents, and on a bushel of corn 28 cents. In 1890 the cost had been reduced on wheat to 14½ cents, a decrease of 52 per cent., and on corn to 11½ cents, a decrease of 59 per cent.

"This has brought entirely new and changed conditions to the farmers of New York and of the East generally. Gradually the cattle and sheep fattened upon the hillsides of well-fenced farms and fed in the stables of comfortable buildings have been displaced in our home markets by those herded on these great, cheap Western plains with no money invested in land or improvements, and the farmers of the East, as one of the direct results of this rapid development in transportation, find their land, with the improvements of years brought to it in money and toil, reduced to the level

of the unimproved land of the new West, while at the same time the market value of their land has been equally seriously affected.

"Emerson once said: 'A man thinks he owns his farm, when the fact is the farm often owns him,' and this is particularly true at the present time of our Eastern farmers, who, in many instances, and I may safely say quite generally, cannot sell their property for the cost of the buildings and fences that stand upon the land. This is where the deep sea of trouble comes in for those who have heretofore loaned money so safely upon farm property, and especially to those who are carrying indebtedness.

"Every civilized country true to the natural law of desiring to provide food for its people has turned its energies upon the building of railroads and canals, and improvement of rivers and harbors, thus reaching out and into all available land for production.

"England has put her strong hand to the plow in the rich soil of Africa, and is bringing out wheat; by the construction of the Suez Canal she reaches over to India and does the same thing. Her ships are ever busy bringing out the food and other products of Australia, while her capital is working the rich soil and cheap labor of South America to her greatest possible benefit.

"Russia has also kept fully apace in railroad building, and she will soon reach the completion of over 2000 miles of railway, with tributaries that will be in readiness to handle wheat from the rich soil of Siberia, where labor is so cheap as hardly to enter into the expense account.

"The extent to which wheat is being produced in other countries, with exceedingly cheap labor, and its effect upon the American wheat-grower, will be seen in the following figures, in a single week's shipment from these points. In the second week of July, 1894, there were shipped to the English market from India, 1,300,000 bushels of wheat; Russia, 1,520,000 bushels; Australia, 3,800,000 bushels; North America, 5,700,000 bushels; South America, 9,900,000 bushels.

"The statement accompanies the South American shipment that the wheat was grown and placed on shipboard for 37 cents a bushel, with a profit of 30 per cent. on the money invested."

Says another witness:

"I have calculated that the produce of five acres of wheat can be brought from Chicago to Liverpool at less than the cost for manuring one acre for wheat in England" (*Testimony of W. J. Harris, a leading farmer in Devonshire, England, before the British Commission, 1886*).

Of New York State the report says:

"While increased population and wealth must have greatly increased the demand for agricultural products, the estimated value of farm products of the State of New York, which, according to the United States census, was figured for the year 1869 at \$253,526,153, in 1889 fell to \$161,593,009. Of course this was largely attributable to the general fall in prices, but this fact will hardly account for so great a loss. It may be noted here that the 'deserted' farm is a misnomer. It is quite true that a large number of farmers have failed agriculturally and left their property to the mortgage, and there are far too many deserted farmhouses, barns, and other outbuildings, but the land itself has been absorbed by some more prosperous farmer or business man of the neighborhood. The land, therefore, and its empty buildings are not to be had for the mere asking. A large portion of this absorbed land is lying idle, and its houses and barns are untenanted, while others are occupied by renters on the tenant system."

In England, the depression of agriculture is the same. A royal commission on the subject has been appointed, but with little hope of more than registering the disease. Says the *Saturday Review* for September 28, 1895:

"It is not too much to say that not Ireland, not the unemployed, not Local Veto, but the condition of agriculture is the great and instant problem of the day. During the last 20 years prices have fallen so enormously as to leave scarcely a sufficient margin for bare livelihood. As a result, the tendency has been continuously to throw the land out of cultivation and to convert it into grass land. In the 20 years be-

tween 1873 and 1893 no less than 1,735,631 acres were thrown out of cultivation in England alone. . . . The rents of land have been reduced within these 20 years by amounts varying in different districts from 10 to 40 per cent. . . . In fine, it is manifest that tenants are too poor to pay even the largely reduced rents, and that land-owners similarly cannot afford to make any further concessions without practically giving the land away."

Various propositions are made in England to meet the difficulty: (1) A reduction of rent; (2) fair trade, if not protection; (3) cheaper railway rates; (4) the institution of light railways; (5) amendment of the Agricultural Holdings Act; (6) security of tenure and arbitration; (7) division of rates; (8) revision of the incidence of taxation; (9) cooperation; (10) bimetallism; (11) a bounty; (12) an alteration of the Tithe Commutation Act of 1836; (13) agricultural education; (14) land restoration; (15) socialism. (For a further discussion of English agricultural conditions, see COOPERATIVE FARMING; LAND; NATIONALIZATION SOCIETY; LAND RESTORATION LEAGUE.)

As for the causes of the depression in the United States, we present, first, what may be called the conservative view, and, second, the radical view. The report of the above-quoted New York society, in answer to the questions sent out in

Causes.

New York State, gives the following percentage of the principal causes assigned: Low-price farm products, 25 per cent.; opening of Western new land, 15 per cent.; price of labor higher in proportion than prices, 10 per cent.; loss of fertility in the soil, 8 per cent.; scarcity of good farm laborers, 4 per cent.; unjust and unequal taxation, 4 per cent.; want of tariff protection in farm products, 3 per cent.; overproduction, 3 per cent.

Mr. G. T. Powell mentions the following causes:

- (a) Ignorance of unlocking farther fertility.
- (b) Rapid development of wheat production on cheap lands.
- (c) Poor roads.
- (d) Lack of social advantages.
- (e) Too many acres under inferior cultivation.
- (f) International causes.

Too many farmers, he claimed, did not intelligently cultivate their land, paid little attention to fertilizing, were not wise in selecting and managing their crops, live stock, etc. He instanced cases where the presence of agricultural schools, experiment stations, etc., or even lectures on agriculture had changed the outlook of whole communities, turning failure into success. Too many farmers and farmers' families, according to this report, leave the farm for the city because they think they can have more pleasure, more advantages, more fun for less work. Sons refuse to receive a farm as a gift, if they must work it. Mr. Powell states that some of the causes of the depression are avoidable, others not. He proposes as palliatives:

"Greater knowledge on the part of the farmers to unlock further fertility in the soil and supply most economically the loss of fertility occasioned by production.

"More knowledge of the developments of agriculture that are going on in our own and other countries, that we may avoid certain lines of competition where-in no profit can be derived.

"Less acres better cultivated, that maximum yields can be obtained, thereby reducing the cost of production.

"Encouragement of forestry, that many naked, widespread acres now unprofitable for cultivation may again be covered, growing trees adding permanent value to the land, modifying temperature and subserving moisture.

"Planting again the standard of the advantages and desirabilities of country living and building up of country homes.

"More of high schools in rural communities, through consolidation of school districts where better educational facilities may be had and some principles of agriculture taught.

"Encouragement of small land-holdings, that more people may have homes in rural communities, thus making possible good schools, churches, and society.

"More of organization and of the extension of the Grange and farmers' clubs, to study business interests closer and to develop greater social advantages for all, especially for the young. Better highways, that products may be moved at least cost, and schools, churches, and social gatherings reached with greater ease. Free rural mail delivery, that farmers and their families may be in closer touch with the world, and have daily knowledge of markets and values. Encouragement in every way of the largest possible consumption of all products by producing the best, and getting them before the consumers in the most attractive manner. Removal of the liquor saloon, as its existence is a menace to moral and business welfare, and is without excuse in a rural community. The establishment of labor exchanges in country and city, that the wants of employers and employees may be better known over a wide territory.

"As exhaustion of soil is occasioned by production to supply the cities' needs, the cities' waste in sewerage, garbage, etc., should be collected, manufactured, and returned to the country for restoring in this way the productivity of the soil.

"The establishment in every county in the State in time of agricultural schools on farms where instruction and intelligent practice may be combined, and where not only the sons and daughters of farmers may receive training and more skilful work, but those also who are inclined to go from the city to the country might be taught intelligent management, which would result in many seeking land investment, and the establishment of homes in the country by city dwellers."

Such is the conservative view. The radical view does not deny that farmers need more education and wiser methods, but does not admit that this goes at all to the root of the evil. It points out that as long as a few farmers improve their methods more than the average this may give those few success by giving them an advantage above their competitors; but that if all farmers, or even the majority of farmers, adopted these methods, they would simply be able to produce larger quantities at cheaper cost, and so prices **Low Prices**.

Simply go down, and the farmer be left financially no better off than before. There can be no general improvement for the farmer, this radical view believes, until he gets better prices—*i. e.*, a better return for his labor. Then, when he is prosperous, he will be able to have happy homes, good schools, social advantages, which will keep the boys on the farm. Even Mr. Powell says, "Much has been said and written about 'How to keep the boys and girls on the farm.' Let them see some money in it, and that will solve the question." Now, the main thing that has lowered prices, according to most of the farmers of the West and South, as above stated, is the contraction of currency, voted, the farmers assert, by the political dictation of the gold kings of the East. Hence the People's Party, the political uprising of the Farmers' Alliance, etc. (See CONTRACTION OF CURRENCY; PEOPLE'S PARTY; FARMERS' ALLIANCE, etc.)

Nor is this the only evil. The farmers believe

that dishonest legislation and dishonest office-holders, by iniquitous laws or iniquitous violations of just laws, have allowed great railroad corporations, foreign syndicates, favored capitalists, to buy up at a song, or to get free under abuse of the Homestead Law, Desert Land Laws (see PUBLIC DOMAIN), large tracts of the best land, for which they have often paid nothing, and on them to create bonanza farms worked with machinery. Here producing on a large scale, and with no mortgages to meet, they are able to raise and sell grain at prices with which ordinary farmers cannot compete. Railroads, too, and grain speculators in New York and Chicago, the farmers claim, create corners in the market, and compel the farmers to sell to them almost at a loss. These evils the farmers believe are allowed because the farmer has little voice in Congress. Congress is made up, they declare, of corporation lawyers and representatives of the capitalists of the East. Hence in every way, while all farmers admit the necessity of education and improved methods, and are organizing for education in their Granges and Farmers' Alliances, the distinctive aim of the recent Farmers' Movement is to increase the circulation and rescue legislation from the domination of the railroads and mortgage-holders who to-day are forcing prices down, and by mortgage foreclosures driving the farmers to ruin. (See PEOPLE'S PARTY; FREE SILVER; FARMERS' ALLIANCE; CONTRACTION AND EXPANSION OF CURRENCY.)

FAUCHET, CLAUDE, was born at Dornes, France, in 1744. For a while court preacher for the Louis, he lost his position owing to his radical views. At the storming of the Bastille he took an active part, and was requested to prepare a eulogy over those who fell in the attack, and as a result produced his *Discourse upon French Liberty*, in which the central idea was the union of the gospel of love with the program of the Revolution. In 1790 he was instrumental in establishing a society or circle of the Friends of Truth, and as an organ of the club, the *Bouche de Fer* (The Iron Mouth), a paper in which he developed his religious ideas in union with the theories of Rousseau's social contract. "Unite the Gospel of Christ with the spirit of freedom," was Fauchet's pregnant utterance, "and our joy shall be full." In 1791 Fauchet was elected constitutional Bishop of Calvados, and sent as a representative to the Legislative Assembly of 1792. He voted against the guillotining of the king, and on account of taking this position, and because of his landed property, he

was brought before the revolutionary tribunal and guillotined with the Girondists, October 31, 1793. An account of his life and views can be found in Stegmann and Hugo's *Handbuch des Socialismus*, article "Fauchet."

FAWCETT, HENRY, son of William Fawcett, a magistrate of Salisbury, was born in 1833. Educated at a local school near Salisbury, at Queenwood College, at King's College School, London, and at Trinity Hall, Cambridge, he was graduated there in 1856, and subsequently chosen a fellow. He first practised law in London, but soon left this for political activity. In 1858 an accident, while shooting, left him totally blind for life. He nevertheless lectured on finance at Oxford and Glasgow, and elicited general attention. In 1863 he published his chief work, *A Manual of Political Economy*, which has been much used as a text-book of economics of the orthodox school. He was immediately elected to the chair of Political Economy at Cambridge. In 1865 he was elected M.P. for Brighton, which he continued to represent till 1874. He was a Radical of the old school; but made his mark standing for woman suffrage, refusing on principle to pay any but the merest official expenses of his election, advocating the abolition of university tests, investigating the miseries of the agricultural laborer, etc. In 1867 he married Millicent Garrett (see below). In 1874 he was defeated for Brighton, but returned for Hackney, and again in 1880. The same year he became Postmaster-General in Mr. Gladstone's second administration, and would have been a member of the Cabinet but for a conscientious scruple. He introduced many reforms into the postal system. In 1883 he was elected Lord Rector of Glasgow University, and received the titles of D.C.L. and LL.D. He died at Cambridge, November 6, 1884. A strong individualist, with little originality or genius, he influenced men by the force of his personality. His best works, besides his *Manual*, are *The Economic Position of the London Laborer* (1865); *Free Trade and Protection* (1878); *Essays and Lectures* (1872). His Life was written by Leslie Stephen (1885).

FAWCETT, MILICENT (*née GARRETT*), was born in 1847, and married to Henry Fawcett in 1867. She assisted her husband in all his studies, and in 1869 published a *Political Economy for Beginners*. A leader in the woman's suffrage movement, she has also written many economic essays and a series of tales illustrative of political economy.

FEDERAL COURTS. See JUDICIARY.

FEDERAL GOVERNMENT.—"Stated broadly, so as to acquire somewhat the force of a universal proposition," says Dr. John Fiske (*American Political Ideas*, p. 133), "the principle of federalism is just this: That the people of a State shall have full and entire control of their own domestic affairs, which directly concern them only, and which they will naturally manage with more intelligence and with more zeal than any distinct governing body could possibly exercise; but that, as regards

matters of common concern between a group of States, a decision shall in every case be reached, not by brutal warfare or by weary diplomacy, but by the systematic legislation of a central government which represents both States and people, and whose decisions can always be enforced, if necessary, by the combined physical forces of all the States."

Federalism has been practised from the earliest times among certain savage races, as among some of the North American Indians, in more developed form among the ancient German tribes, and for certain purposes among the Greek States, the English heptarchy, and other peoples. It reached a still fuller development in the old German Empire, but has been principally developed in modern republics.

Says Mr. E. V. Robinson (*Annals of the American Academy*, vol. iii., p. 786):

"There can be no security against despotism but limitations upon the Government; and no effective limitations upon the Government but such as are imposed by a higher power, the State, and enforced by separate and coordinate organs of government created by the State and participating in the action of the general government. But this is the Federal State, a form long considered a transition stage between the league of States and the simple State, but now recognized—in other countries at least—as the most interesting and significant product of institutional development.

"Its importance is proved by its success. In a century the new form has overspread the earth. 1787 in the United States; 1848 and 1874 in Switzerland; 1866 to 1870 in Germany; 1867 in Canada and Mexico; 1889 in Brazil; 1891 in Australasia—these dates record a progress unchecked by reverse, unparalleled in rapidity and extent. Federalism has succeeded in conditions the most diverse; here knitting scattered colonies of a

History of Federalism.

kindred race into a nation equally strong and free; there forming hostile races, tongues, and creeds into compact and vigorous States. It is strong and flexible. No shock has severed its well-knit meshes, and nations the most unlike move with equal freedom in its enveloping folds. The whole drift of the political world is toward federalism to-day, as it was toward feudalism in the tenth century, and centralism in the fifteenth. The time may not be far distant when a centralized simple State will be as great an anachronism as a mail-clad knight in a modern army."

Of the nature and development of the chief modern federal governments, Mr. Robinson says (*idem*, pp. 787-790):

"The Canadian Union was the work of one external sovereignty. A congress of delegates appointed by the provincial legislatures framed the desired constitution, which was then (1867) enacted *en bloc*, as an ordinary statute, by the British Parliament.

"In Switzerland and the United States the ordaining sovereignty was one and internal. Previous to 1848 the cantons are said to have been separately sovereign. The only central authority was the Diet, consisting of one instructed vote from each canton. But unanimity was not required for decision, consequently a canton could be bound against its will, and coerced by arms if it resisted—as occurred in the Sonderbund war in 1847. Thus Laband's conception of the German Empire exactly fits the Switzerland of that date; sovereignty rested in the cantons not individually, but collectively. There were not as many sovereignties as cantons, but one sovereignty, of which the cantons were cobearers (*Mitträger*). To the cantons collectively the cantons individually were subject; just as each Roman senator was subject as an individual to the Senate as a whole. Following the Sonderbund war a committee of the Diet drafted the new constitution; the Diet itself then revised and passed it. When submitted to the cantons for approval, 15½ cantons accepted, 6½ rejected it. The constitution thereupon went into effect for all alike. The sovereignty in the old confederation, therefore, decreed the new Federal organization. No absolute-

ly new State was created, but a rudimentary exchanged for a well-developed form.

"The same was true in America, but is not so easily seen. The traditional view regards the individual States as separately sovereign under the Confederation. Article 2 declares: 'Each State retains its sovereignty, freedom, and independence.' But words cannot obliterate facts. The States could not 'retain' what they had never possessed. They had always been subject to a political superior. First to England; secondly to the Continental Congress, a revolutionary body; hence *de facto* sovereign; and thirdly, under the Confederation each State individually was subject to the States collectively. In the American, as in the Swiss Confederation, sovereignty was one and the States were its cobearers; each as an individual was subject to the States collectively." This, however, is a disputed point. See STATE RIGHTS; CENTRALIZATION; CONSTITUTION, etc.

Modern Federalism.

He continues: "In Germany, the situation was different in that the contracting States had been and still were separately sovereign. August 18, 1866, the North German States provided by treaty for the founding of a Federal State within one year, the constitution to be drafted by a Conference of Envoys at Berlin, and passed upon by a Reichstag elected on the basis of the Frankfort election law. These provisions of the treaty were then enacted by the State legislatures as State law. State law they would have been without special enactment, since the August treaties rested upon State authority; State law they had to be, if law at all, since law requires a law-giver, and only the States then legally existed. Both Reichstag and Conference therefore rested equally on State authority. The Conference sat December 15, 1866, to February 7, 1867. Its draft was submitted to the Reichstag February 24 by the King of Prussia, in the name of the associated governments. The Reichstag proposed amendments; these were accepted by the Conference. Both then dissolved and disappeared. The bodies created by State authorities had done their work, but the States were not legally bound by it, any more than the British Parliament was legally bound by the recommendations of the Canadian Constitutional Congress. The States did ratify the report of their agents, and fixed July 1, 1867, as the day for it to go into operation. But legally they could as well have rejected it. The lapse of the specified year would then have restored the *status quo ante* August 18, 1866. If, therefore, the criterion of the existence of a new State be the existence of a new political authority, setting a limit to older authorities, then no new State existed prior to the ratification of the constitution by all the States.

"It is indeed unquestionable that the German nation already existed, *i.e.*, that the German people were conscious of common interests, feelings and aspirations. It is equally unquestionable that such feelings could not but result in new political relations, and that in an historical and dynamical sense, the nation did, as a matter of fact, employ the States as instruments in the creation of a new State. But it is generally agreed that a nation is not a State politically organized, and a State cannot be said to give its political organization, because such organization is prerequisite to its being a State."

Mr. James Bryce (*The American Commonwealth*, chaps. xxix., xxx.) sums up the faults generally charged against federal forms of government as:

- "1. Weakness in the conduct of foreign affairs.
- "2. Weakness in home government—that is to say, deficient authority over the component States and the individual citizens.
- "3. Liability to dissolution by the secession or rebellion of States.
- "4. Liability to division into groups and factions by the formation of separate combinations of the component States.
- "5. Want of uniformity among the States in legislation and administration.
- "6. Trouble, expense, and delay due to the complexity of a double system of legislation and administration."

Few of these dangers, he thinks, however, have developed in the United States. He says:

"All that can fairly be concluded from the history of the American Union is that Federalism is obliged by the law of its nature to leave in the hands of States powers whose exercise may give to political controversy a peculiarly dangerous form, may impede the assertion of national authority, may even, when long-continued exasperation has suspended or destroyed the feeling of a common patriotism, threaten national unity itself. Against this danger is to be set the fact that the looser structure of a Federal government and the scope it gives for diversities of legislation in different parts of a country may avert sources of discord, or prevent local discord from growing into a contest of national magnitude."

The merits of the federal form of government he considers to be: (1) That federalism can unite States into one government without extinguishing local governments, legislatures, and patriotism; (2) that it supplies the best means of developing a vast country; (3) it prevents the development of overcentralization; (4) it interests people in local self-government; (5) it secures the good administration of local affairs; (6) it allows of experiments in legislation; (7) it diminishes the risk which comes from size and diversity in the structure of a nation; (8) it relieves the national legislature of burdens which might prove too heavy. All these advantages Mr. Bryce holds true of the United States. (But see DEMOCRACY. For the details of the Federal Constitution of the United States, see CONSTITUTION. For other countries, see those countries.)

FEDERALIST, THE.—A series of 85 papers written by Hamilton, Madison, and Jay immediately after the adoption of the United States Constitution, and published in the *Independent Journal* of New York from October, 1787, to March, 1788; they were then collected in book form and called *The Federalist*. Hamilton (*q.v.*) wrote some two thirds of them, and they did much to advance the cause of the Federalist Party (*q.v.*).

FEDERAL PARTY, THE, was the name given, at the time of the adoption of the Constitution, to those who favored the Constitution as framed by the convention at Philadelphia of 1787. The name was later adopted by the party developed under the lead of Alexander Hamilton (*q.v.*), which favored a strong central national government, friendly relations with Great Britain rather than with France, the fostering of commercial interests, the assumption of the State debts, and the chartering of a national bank, etc. It controlled the general government till 1801. Says Schouler (*History of the United States*, vol. 1, p. 54): "To speak logically, it was the anti-federal party that sustained a federal plan, while the Federalist contended for one more nearly national." (For a discussion of the views of the party, see CENTRALIZATION; STATE RIGHTS; CONSTITUTION; DEMOCRATIC-REPUBLICAN PARTY; HAMILTON.)

FERRARA, FRANCESCO, was born in Palermo, Sicily, in 1810, and was Professor of Political Economy in the University of Turin from 1849-64. In 1867 he was Italian Minister of Finance, and at another time elected Senator. He was editor of the *Giornale di Statistica*, 1836-48. He introduced the ideas of Carey

(*q.v.*) into Italy, and was an influential leader in Italian economics. (See POLITICAL ECONOMY, "Italy.")

FERRARIS, CARLO FRANCESCO, was born in 1850 at Montcalvo. He took the degree of LL.D. at Turin, and subsequently studied in Germany and England. He has held several professorial and political offices, and since 1885 has been full professor of statistics in Padua. In 1886 and 1887 he was also a member of the Italian House of Deputies.

The recent spread of German thought and methods in economics and statistics, and their influence upon the social policy of Italy, may be referred in no small measure to Ferraris, as professor, statesman, and author. (See POLITICAL ECONOMY, "Italy.")

FEUDALISM (from early middle English *fe, fee, feh, feoh*, medieval Latin *feodum*, cattle, property, tribute), a social system prevalent in one form or another in Northern and Western Europe, through all the Middle Ages, according to which land was held by its owners as *feuds* or *feifs* on condition of paying service to a superior lord.

The origin of the system is uncertain. It seems, however, to have been first developed in Germany. Some find its origin in the Roman custom of making grants of land to tribes on condition of paying certain tribute or military service. It is certainly not very different from certain Roman forms of land ownership. (See LAND.) Most authorities, however, trace it to older and more fully Germanic and perhaps Asiatic origin—a development, it may be, of the early forms of land tenure. (See PRIMITIVE PROPERTY.) German chiefs had their *comitatus* or retinue of "freemen" surrounding and serving them in peace, and especially in war. Beneath these were the serfs or tillers of the soil, dependent on the freeman. It was a system of society partly separate from and eventually largely replacing the relation of the individual to the State. Under feudalism the individual placed himself or was placed as a vassal (a word probably of Celtic origin, at first meaning servant) under a superior. He was said to be under *commendation* to him, and for the protection given by the lord he owed him *obsequium*, or willingness to serve. Feudalism was connected with the older Roman system of *beneficia*, or the giving of property for use, but with responsibility to the donor or heirs. From this system grew up the ecclesiastical benefices. Feudalism changed the *beneficia* into *feuda*—property held under personal allegiance, *allodia* being property held in fee simple. The service paid by the vassal was service in war (*service d'hoste*), the obligation to appear at his lord's courts (*justitia*), money payments (*auxilia*), and homage. "Homage," says the *Treatise of Tenures*, "is the most honorable service and most humble service of reverence that a frank tenant may do to his lord, for when the tenant shall make homage to his lord, he shall be ungirt and his head uncovered, and his lord shall sit and the tenant shall kneel before him on both his knees and hold his hands jointly together between the hands of his lord, and shall

say this: 'I become your man, from this day forward, of life and limb, and of earthly worship, and unto you shall be true and faithful, and bear you faith for the tenements that I claim to hold of you, saving the faith that I owe to our sovereign lord the king;' and then the lord, so sitting, shall kiss him." The tie of feudalism was thus essentially a personal tie for the use of land.

In one way or another came feudalism. It grew up from the fifth to the ninth century, when it is found somewhat fully developed in Germany, and developing in the adjacent countries. In Germany,

Origins. however, the different chiefs were so independent that a centralized feudalism never appeared. It is

among the Normans, in Gaul, in Aragon, through large portions of Italy, and, after the Conquest, in England, that we find its fully developed and centralized form.

Here all land is held as belonging to the king, representing the whole people. He divides the realm among his barons, to rule over and defend.

The Feudal Principle. For this they pay tribute to the king and receive tribute from their retainers or vassals—the tribute in time of war being military service.

They in turn divide their baronies among the lesser nobility, and they among the freemen, each paying tribute to his superior. The serfs, finally, live on the domain of the lord of the manor (the freeman), cultivate it, and have certain rights of domicile and pasture, for receipt of which they pay service to the lord. The serf pays no tribute to the king, only to his liege lord; the liege lord pays to his superior, and so on up to the king. This is the feudal *idea* modified in history in a thousand ways and by a thousand special grants and privileges. The basis of the whole system is the land tenure, which is "the sacramental tie of all public relations."

The system, however, once developed, immediately began to change. When the English kings began to fight in France it became more convenient for the Northern barons to give payments of money instead of military service; and the king preferred this, since it enabled him to hire troops who would serve him more unquestioningly. Gradually the system of paying money instead of service developed into the rule. Out of this came parliaments (*q. v.*), first called together to vote supplies for the king. But out of this came also other institutions. Under feudalism proper the serf paid nothing to the king directly, but only to his superior lord. When the king wanted money, it occurred to his councilors that he might get money by taxing the serf as well as the lords. The early poll taxes were resisted (see PEASANTS' REVOLT), but they were collected. It was forgotten or ignored that the serf already paid the king *through the lord*; that the serf only paid the lord because the lord paid the king. The lords were quite willing to have the serfs pay the king, because then they could claim that the king was paid, and keep what they received *as their own*. This developed the landlord system of England. Hitherto the lords had ruled their lands, not as owners, but as rep-

resentatives of the king, and what they received from their vassals they paid over to the king, at least in part. They now claimed to own the land, and kept the tribute as *rent*. The king, they said, was paid through *taxes*. Out of this has developed modern England.

It is not claimed that the development took this simple and conscious form; but it explains a large portion of what actually occurred. Under feudalism the vassal did not pay both tax and rent. His rent or service was his tax. Says Rogers (*Six Centuries of Work and Wages*, p. 56): "There was in the thirteenth century no rent paid in the ordinary sense of that word." Such conditions have led to two extreme views of feudalism: the one too favorable, the other too severe. According to one view, to which conservatives and some socialists are inclined, the laborer under feudalism was better off than to-day. Every man was entitled to the use of a little land, with perhaps a cottage and the right of pasturage and of getting fuel in the manorial woods, all on the one condition of paying a little service or work to his lord. Each man had a place, a lowly place indeed—a cottage, rough and dark, with few comforts. But then the lord did not have modern comforts, and at least the serf was sure of his living and related by ties often of personal regard to the lord on whose estate he lived, and whom he could occasionally see and know. There was no landless class, and there was not the modern impersonal "cash nexus" and freedom, which is often a freedom to starve.

The other view, to which liberals and individualists are inclined, goes to the other extreme. It dwells upon the rough home and food of the mediæval serf, above all upon his oppression by his lord. He had a place, it is true, but a dog's place and a dog's life. How vastly better off, it is said, is the working man of to-day. (For a fuller discussion of this, see MIDDLE AGES.) Feudalism has gone. Serfdom disappears in England after the Peasants' Revolt (*q. v.*). Feudal tenures were abolished by act of Parliament in England in 1660; in Scotland in 1747. In France they disappeared in the Revolution of 1789; in Germany and Austria, in the Revolution of 1848-50. In each country, however, the system had long been modified by political and social changes. A feudal system is said to have early developed in China and Japan, but to have disappeared in the former country as early as 220 B. C., on the conquest of the country by Siang Wang, of Tsin, or Tsin-shi-Hwang-ti. In Japan, it endured till 1871, when the *daimios* or barons surrendered their lands to the Mikado. (See JAPAN.)

FICHTE, JOHANN GOTTLIEB.—This great German philosopher we consider here simply from the standpoint of social reform, he being, according to some, the real father, and at least the first manifestation, of the great German movement toward socialism.

He was born at Rammenau, in Lusatia, in 1762. Even as a child he was noted for his con-

**Devel-
opments.**

landlord system of England. Hitherto the lords had ruled their lands, not as owners, but as rep-

templative spirit. At 18 years of age he entered the University of Jena, studying theology at first, but soon relinquishing it for philosophy. On leaving college he earned a precarious support by becoming a tutor, wandering from place to place. In 1791 he met Kant and became a zealous follower. In the following year he wrote his *Critique of all Revelation*, which Kant highly commended. For a time he found it very difficult to obtain even the means of subsistence; but in 1794 he was appointed to the chair of philosophy at Jena. At once he commenced to expound, or, rather, to preach his system of transcendental idealism, with the utmost zeal and enthusiasm. He soon broke loose from Kant, whose philosophy was not sufficiently idealistic for him. As he said to a friend, "Kant has only indicated the truth, but neither unfolded nor proved it." In 1799 a groundless charge of atheism removed him from the college; and he took up his residence in Berlin, still lecturing on philosophy. Six years later he was called to the chair of philosophy at Erlangen. It was here that his famous lectures on *The Nature of the Scholar* were delivered. The victories of Napoleon stirred all his patriotism, and brought forth his fervid *Addresses to the Germans*. On the restoration of peace he was elected rector of the University of Berlin, where he labored with his accustomed zeal and energy to check and abolish all customs that appeared to him inconsistent with the true life of scholarship. In 1813, on the outbreak of the war of independence, his wife offered herself as hospital nurse, and for five months waited upon the sick soldiers with unremitting devotion and tenderness. She was then taken with fever, and after a long struggle recovered only to pass on the infection to her husband. He rapidly sank under it, and died January 27, 1814.

In Fichte were united the profundity of a philosopher, the fire of a prophet, the self-sacrifice of a patriot, and the purity and devotion of a saint. The fundamental notion of his philosophy is the reality of the ego, which posits both itself and the non-ego. As to his socialism, the following quotations speak for themselves.

In his *Materials for the Justification of the French Revolution*, he writes: "Property can have no other origin than labor. Whosoever does not work has no right to obtain the means of existence from society." In 1796 he proclaimed "the right to property." He says in his *Principles of Natural Right*, "Whoso has not the means of living is not bound to recognize or respect the property of others, seeing that, as regards him, the principles of the social contract have been violated. Every one should have some property; society owes to all the means of work, and all should work in order to live." In his book on *The State in Accordance with Right (Rechtstaat)*, he foreshadows a collective organization which would realize what he understands by right: "Labor and distribution should be collectively organized; every one should receive for a fixed amount of labor a fixed amount of capital which would constitute his property, according to right. Property will thus be made universal. No person should enjoy superfluities as long as anybody lacks necessities; for the right of property in objects

of luxury can have no foundation until each citizen has his share in the necessities of life. Farmers and laborers should form partnerships, so as to produce the most with the least possible exertion." The essential ideas of the socialism of to-day, as regards both the notion of right and its realization, are contained in embryo in the foregoing lines, which were manifestly occasioned by Rousseau and the eighteenth-century philosophers, tho modified by his deep and pietistic Christianity.

His collective works have been published by his son (1845-6). His popular works have been translated into English by W. Smith (1848-9). Their titles are: *The Destination of Man*; *The Vocation of the Scholar*; *The Nature of the Scholar*; *The Way to the Blessed Life*; and *The Characteristics of the Present Age*. His *Rechtstaat* was translated by A. E. Kroeger (1868-70).

FIELDEN. See CHICAGO ANARCHISTS, last portion of the article.

FINANCE, THE SCIENCE OF (from medieval Latin, *finis*, an end, or payment in settlement), is correctly used in economics for the science of the raising, administration, and expenditure of the revenues of a nation, state, or city. The word finance is popularly but incorrectly used for the discussion of the subject of money; perhaps because, in the United States especially, questions of revenue have been so intimately connected with those of money.

In classic times, while there was often wise management of the public finances, there was little development of theory or principles of finance. The work of Xenophon on the revenues of Athens was simply a discussion as to how the city might derive sufficient revenue from its own territory. He recommends a state monopoly of silver mining. The Romans developed **Development**, still less theory. The first modern development of the science was by the German cameralists (*q.v.*). These often gave good, practical advice, but still with little system or theory. From the seventeenth century the school of the mercantilists (*q.v.*) began to have weight, and in the eighteenth century the school of the physiocrats (*q.v.*). The German cameralists discussed finance largely as a matter of the management of domains and monopolies. The mercantilists were more for duties, customs, and bounties. Under the influence of the physiocrats we have the development of the idea of the *impôt unique*, the single tax on land. Under Adam Smith and his followers we have the development of the ideas of free trade and the substitution of other taxes for custom duties. In the development of the modern science of finance the Germans lead. They divide the science into three parts: 1. The organization of the financial economy; 2. Public expenditure and the purposes for which it may be made; 3. Public revenue and the sources from which it may be derived. The ordinary sources of revenues are divided into three kinds: (1) from agricul-

Content.

tural, industrial, or commercial enterprises (see NATIONALISM; MUNICIPALISM; RAILROADS; POSTAL SYSTEM; TELEGRAPH); (2) from fees; (3) from taxation (*q.v.*).

In the conduct of a State's financial system, Professor E. J. James (article "Finance," *Lalor's Cyclopaedia of Political Science*) finds four main systems: 1. The German, where all public offices are filled from the ranks of persons who have shown their fitness by prescribed tests, and after a period of probation are appointed with a right to the office and a salary as long as its duties are properly performed; 2. The French system, where the salaried officer, tho professionally educated, may be removed at pleasure; 3. The American system, in which the salaried officer may be removed for political reasons without any question of fitness; 4. The voluntary system, where officers are filled by those able and willing to act without salary. Professor James considers the German system, tho nominally the most expensive, in reality the cheapest and the best. (See REVENUE; TAXATION.)

References: Adolph Wagner's *Finanzwissenschaft* (1877-82); C. F. Bastable's *Public Finance* (1892). See also TAXATION.

FIRE DEPARTMENTS.—The earliest fire companies were composed of volunteers, tho sometimes inducements to join were held out by exempting them from jury duty. They were something like social and sometimes political clubs. In New York, the firemen became a power in ward politics. The paid fire department of New York City was organized May 4, 1865. Since then the system has spread to all the large cities and attained remarkable efficiency, organized usually under fire commissioners. Fires are much more frequent in America than in Europe, because of poorly constructed houses and lack of construction laws in America. This, however, is being changed. Partly as a result, the American fire departments are generally thought to be much more efficiently developed. In London, the Fire Brigade numbers about 900. The wages have been recently raised by the County Council, and the efficiency greatly increased, with improved quarters and enormously multiplied fire hydrants. The cost of the department is only one half that of New York, but fires are less frequent than in many small American cities. The Berlin force is about 900, under State control. In Paris the force is quasi-military.

The following figures are from Census Bulletin No. 100:

CITIES	Force.	Annual Cost of Department.	Cost of Force to Each Head of Population.
New York, N. Y.....	1,027	\$1,613,296	\$1.06
Chicago, Ill.....	916	706,437	0.64
Philadelphia, Pa.....	521	625,000	0.60
Brooklyn, N. Y.....	527	562,044	0.70
St. Louis, Mo.....	359	277,869	0.62
Boston, Mass.....	677	800,000	1.78

ANNUAL PROPERTY LOSSES IN THE UNITED STATES BY FIRES—1886-95.

YEARS.	Aggregate Property Loss.	Aggregate Insurance Loss.
1886.....	\$104,924,750	\$60,506,567
1887.....	120,283,055	60,659,508
1888.....	110,885,605	63,965,724
1889.....	123,046,833	73,679,465
1890.....	108,993,792	65,015,465

Netherlands.....	2,000,000	0.50	..
Russia.....	70,000,000	0.85	9
Scandinavia.....	6,500,000	0.80	..
Spain.....	2,500,000	0.15	..

FISHERIES.—The value of the fisheries of the United States, according to the census of 1890, was: Product of the year 1889, \$44,277,518; capital invested, \$43,602,123; the persons employed, 136,665 fishermen and 26,683 shoremen. A system of profit-sharing was introduced into the cod and mackerel fisheries of the United States about 1730.

When a ship was built the builders would take shares in it—the painter, sail-maker, rigger, captain, and all who were to man it. In trading, the whole ship was divided into 64 shares. The builder would take a large part, the captain and mate each one share or one half share, and so on down through the entire crew. The chief owner was known as "the ship's husband." He determined the plans of the voyage. In fisheries, a ship would be held in five shares. The owner held two fifths and the crew (captain, mates, and men) held three fifths. Profits were divided among these conjoint owners according to the shares held. The owner kept the ship in repairs and the whole company paid the expenses. This custom has only in small part been kept up—longest in the Maine fishing smacks. To-day the fishers are poorly paid.

In Great Britain and Ireland the value of the fisheries reported for 1895 was £7,147,665. The number employed, including the Channel Islands, was 124,187. In France, the number

enrolled in cod-fishing, January 1, 1894, was 10,503, and for coast-fishing, 74,129. The value of the fish of both kinds taken in 1893 was \$25,537,400.

FLÜRSCHHEIM, MICHAEL, was born at Frankfort-on-the-Main, Germany, January 27, 1844, and educated there from 1850-60. From 1860-67 he worked in banks in Frankfort, Berlin and Paris. In 1867 he went to the United States, where he worked as an importer, manufacturer and inventor—first in New York, and from 1870-72 in Virginia. In 1872 he returned to Germany, first engaged in a journalistic enterprise (*The American News*), and in 1873 purchased the Gaggenau Iron Works, which he conducted for 15 years with great success. In 1888 the works were turned into a limited company. He introduced new industries into Germany, and at one time he had taken out over one hundred patents. In 1883 he began to devote a part of his time to social reform. The writings of Dr. Theodor Stamm and Henry George opened a new vista. In 1884 his first book, *Auf Friedlichem Wege (By Peaceful Means)*, appeared. In 1887, with the aid of a friend, he founded the monthly, *Deutsch Land*, and edited it until 1889, when it was continued by the German Land Nationalization League (Deutscher Bund für Bodenbesitz Reform), which he had founded in 1888. Besides this society, he was the originator of two similar societies, in Switzerland and Holland, and in 1890 or 1891 he became one of the vice-presidents of the English Land Nationalization Society. In 1886 he published *Deutschland in 100 Jahren (Germany in a Hundred Years)*, a precursor of Bellamy's *Looking Backward* and the flood of similar writings following in its wake. In 1889 he completed and soon published *Der Einzige Rettungsweg (The Only Way of Salvation)*, and in 1890 he wrote in English, *Rent, Interest and Wages*, which appeared in 1891 (Reeves, London). In 1894 he published *Bausteine für Social Reform (Building Stones for Social Reform)*. In 1893 he went to the United States and to Mexico, to assist in the foundation of a cooperative colony on land nationalization principles, because he thought a model commonwealth to be one of the most efficient means of propaganda. Tho a follower of Henry George in the general idea that common land ownership is the foundation-stone of social reform, Mr. Flürschheim entirely differs from him in most other theories, and also in regard to George's proposal of the single tax, which he calls confiscation. He prefers full land nationalization, with compensation of land-owners. He considers his most important discovery is his crisis theory, which in fact is a solution of the social problem. It was in 1888 that he completed this theory. To state it in a few words, he holds that the cause of commercial depression, of scarcity of work—in fact, of the modern social problem, is that the very rich neither consume the total of their incomes nor do they invest a great part of their savings in products of work (machines, houses, steamers, etc.). They mostly invest in spurious capital, consisting of nothing but tribute claims that give no opportunity for work, but, on the contrary, by in-

creasing the debts of the people, keep back their purchasing power, and thus prevent this power from keeping pace with the increasing productive power of the world, without which it must be impossible to keep at work all producers, for we cannot produce if we do not consume.

This spurious capital, these tribute claims, have their foundation mainly in private land ownership; for rent is the mother of interest and compound interest. As long as capital can invest in land and thus obtain rent, it will claim interest, wherever otherwise invested. When capital can no more purchase rent, it will be offered free of interest (of interest proper—*i.e.*, of interest less risk premium) to labor, as the production of capital, when unhampered by the effects of private land ownership, will exceed the demand, and all who save for a rainy day and for old age will be glad to obtain the advantage of having their savings preserved intact for the day when they need them.

One other reform he proposed lately, which, tho he does not think it a fundamental one, he judges of great importance. This is the nationalization of commerce, the doing away with all middlemen, and effecting direct exchange of products through a State department, that monopolizes it just as letter-delivery is monopolized by another department. He desires to restrict individualism to production where competition is a stimulating element, whereas it only produces waste in distribution. This system would allow the introduction of another reform which is possible in this way—a money reform. Exchange could take place through warrants issued by the commercial department, or checks drawn on the same, which warrants are redeemable only in goods or services. Metal money would become unnecessary or could be restricted to small coins.

He has introduced the above three reform principles into the by-laws of the Mexican colony, Freeland—*i.e.*, common land ownership, monopolization of commerce (distribution) by the community, and warrant money.

FOOD SUPPLY.—The science of nutrition is yet in its infancy. The chemical standards of nutrition have been mainly investigated by Professor Voit and others in Germany, by Sir Lyon Playfair in England, by Professor W. O. Atwater, Mrs. Ellen H. Richards, and Mr. Edward Atkinson in the United States. (See references at the end of this article.) The statistics of the nutritive values of food have been clearly presented by Professor Atwater, while Mr. Atkinson's invention of the Aladdin lamp has almost revolutionized the science of cookery, and is slowly coming into general practice. The following tables and account are abridged from the tables of Professor Atwater and the writings of Mr. Atkinson:

The animal body is a living machine, and, like any machine, needs fuel—*i.e.*, food—to enable it to work, and also, as a machine does not, it needs fuel to keep it alive even without work. About one third of the food eaten goes to maintain life. The main nutriments of the body are protein,* fats, and carbohydrates. What is

* Some chemists deny that there is a substance *protein*, but merely various *proteid* substances.

called protein forms tissue (muscles, tendon, fat, etc.), and serves as fuel. Fats form fatty tissue, and serve as fuel. Carbohydrates are transformed into fat, and serve as fuel. Alcohol serves as fuel, but does not form tissue. Tea and coffee do neither. The standard of nutrition for a man at active but not excessive work is 700 grams of actual nutritive and digestible material free of water, 450 of carbohydrates or starch, 150 of fats, 150 of protein, with such

mineral ingredients as will be found in any miscellaneous dietary in sufficient measure. These elements will yield 3,520 calories, the calorie being the amount of heat necessary to raise one kilo or 1000 grams of water 1° C. In order to make allowances for inevitable waste, we may safely adopt 4000 calories as the average units of nutrition for a man at active but not excessive work for one day.

COST OF 3000 CALORIES OBTAINED FROM DIFFERENT FOOD MATERIALS.

Suet at 6 cts. a lb.	\$4.40
Potatoes at 30 cts. a bush.	5.00
Corn meal at 3 cts. a lb.	5.43
Flour at 4 cts. a lb.	7.20
Sugar at 6 cts. a lb.	10.41
Beef from shin and flank at 4 cts. a lb.	12.00
Sausage, bacon, and ham at 12-12½ cts. a lb.	12.73
Beans and peas at 10 cts. a quart.	13.86
Rice at 8 cts. a lb.	15.69
Skimmed milk at 2 cts. a quart.	17.31
Apples at 4 cts. a quart.	27.39
Butter at 35 cts. a lb.	30.74
Milk at 7 cts. a quart.	34.74
Cheese at 14 cts. a lb.	36.33
Vegetables at 5 cts. a lb.	61.50
Beef, medium fat, with 15 per cent. bone, at 15¾ cts. per lb.	100.00
Eggs at 18 cts.	106.50

From the above table, it is clearly evident that suet, corn meal, and flour are, at present prices, the cheapest kinds of food; but it must not be supposed that the above table teaches that we could live on single articles of food—suet alone, for example—notwithstanding it would furnish the necessary energy, and is cheap. With the exception of wheat, milk, eggs, and possibly one or two other articles, no single food contains all the elements in the right proportion. We need what are called nitrogenous foods, among which may be mentioned wheat, lean meats, peas and beans. We also need energy-producing foods, among which may be mentioned suet, butter, flour, corn meal, potatoes, sugar, etc. Besides these, we still need mineral matter, usually obtained in proper amount from the meats and vegetables, water and air, as well as flavors which make things taste good.

With this knowledge of the elements of nutrition necessary, and of their relative economic value, it is possible in a somewhat scientific way to provide for the food supply of the population. In every city and town much food material goes to waste for lack of time, and still more for lack of knowledge in preparing wholesome dishes. The need is, therefore, being felt of a central station or kitchen to prepare food on scientific principles, and distribute it daily by sale, as bread and milk are distributed. In several foreign countries, notably Germany, people's kitchens have been established. In 1890 there were 14 *Volksküche* in Berlin, which served 2,187,807 meals at noon, or 6000 per day, 423 to each kitchen. Eighty per cent of the meals cost 6¼ cents each; 14 per cent. cost 1½ cents, and 6 per cent. cost 3¼ cents. The cost of running each kitchen was \$6500 per year, but the oversight was voluntary. The 6¼-cent meals contained the right proportions, and consisted of a pint and a half of soup, and three pieces of meat or fish weighing 6¼ oz. The dishes prepared are mainly beans, peas, and cabbage, with meats of different kinds. In January, 1890, an attempt at the wholesale preparation of food was begun in Boston under the direction of Mrs. Hinman Abel. "The Story of the New England Kitchen" has been interestingly told, and branches have been opened in Providence, New York, and elsewhere. (See also **COOKING SCHOOLS.**)

This point of view leads to the question of

the available food supply of nations. Mr. Atkinson, in an address before the American Association for the Advancement of Science, at Ann Arbor, August, 1885, argued that the available supply is all but unlimited. He said: "The so-called law of population, that population tends to increase faster than the means of subsistence has no foundation historically, practically, nor theoretically. The Ricardian theory of rent will have no basis whatever." To support this statement, he argued for the United States as follows:

Available Supply of Food.

"The area of the United States, omitting Alaska, is a trifle less than 3,000,000 square miles. In a broad and general way we may assume that one half this area is good arable land, or quarter good pasture land, and one quarter forest, mountain and mining territory. If 112,500 square miles be used for Indian corn, at 25 bushels to an acre, it would produce 1,800,000,000 bushels. This is largely converted into pork at the rate of five pounds of corn to one pound of pork. Assuming 100,000,000 bushels thus converted and the rest used for human or cattle food, the product of pork would be nearly equal to 18,500,000 casks or its equivalent in bacon; 60,000,000 square miles used for wheat, at 13 bushels per acre, yields a little over 500,000,000 bushels. Setting aside an ample portion for seed, this gives over 80,000,000 persons one barrel of flour per year; 20,000,000 acres of cotton, at the wretched average of half a bale to an acre, would yield 6,400,000 bales in a year; 40,000 square miles for sheep pasturage, when the cur dog is muzzled, could easily sustain 102,400,000 sheep, or four sheep to the acre, which at only four pounds each would yield as much wool as we now consume of all kinds, both domestic and foreign; with 60,000 square miles for pasturage, at one cow to two acres (and if to the fodder be added a meal from the cotton, until recently almost wasted, a cow could be supported on one acre), we could increase our rations of milk, eggs, butter and cheese, and still sustain 10,200,000 cows. A large proportion of our beef is now produced by almost semi-barbarous methods on far distant plains; with fitted forage enough could be raised on 60,000 square miles at 500 pounds to an acre to give nearly one pound of beef to a population of 60,000,000. It follows that our present crops of corn, wheat and cotton (1885) and a very much increased product of the dairy and poultry yard, as well as of meat and wool, could be raised on 352,500 square miles, or upon 12 per cent. of the total area. If *intensive* farming were adopted by men of intelligence and with capital to conduct all parts of the work in a reasonably good way, twice as much could be raised."

In Western Europe, naturally, the food supply is not so good. Europe, outside of Russia and Turkey, has only about one half the area of the United States, and about eight times its population. Great areas of good land, too, in England especially, are thrown out of production by the land system, while the people are fed from fields from 5000 to 15,000 miles distant. The poorer food of the European worker is one chief cause of their lower productivity (*q. v.*). (For statistics as to the amounts and proportion of income spent upon food by the working men of various countries, see **EXPENDITURES.**)

The cost of food in the United States can be seen by table on the next page prepared by Mr. Atkinson.

We close this article by a statement of the revolution created in the science of food by Mr. Atkinson's invention of the Aladdin oven. He says:

"If the present consumption of the country be estimated by the consumption of adult factory operatives, composing a large proportion of females and a lesser proportion of men customarily occupied in or about a cotton factory in the Eastern or Middle States combined, the consumption will be

	Cents per Day	U. S. Population, per Year.

"It occurred to me one day that heat could be put into a box, kept there, and converted into work—the work of cooking. What sort of a box? An iron box? No; iron will not hold the heat; it wastes it, and seems to cook the cook and not the victuals. The ovens of stoves and ranges are iron boxes, and are, therefore, not fit to be used. Why should the iron boxes which make the ovens of iron stoves and ranges be ventilated? Because, in order to cook food in them at all, such an excess of heat must be supplied that they become fat boilers, or fat-rendering machines; the foul smells generated in this process are not wanted in any house. . . . In the Aladdin oven, the heat is put into an outer oven made of non-metallic and non-heat-conducting material, which is, in fact, a form of stiff paper made from wood pulp combined with other substances. Inside is a food receptacle nearly as large as the outer oven, made of sheet metal. The heat passes around the thin iron wall of the inner oven, through which it penetrates in even measure. This inner oven is closed, so that the products of combustion and the direct drying heat of the lamp cannot enter it. It cooks any and all kinds of food material by processes corresponding to roasting, baking, simmering, stewing, braising, sautéing, broiling, and grilling. It can make omelets or griddle cakes, and with a lamp or gas burner of high power can fry. Breakfast for a family of eight or ten can be prepared more quickly in usual forms in this oven by the use of a single lamp than it can be when it is necessary to have a fire in the common stove or range. The cooking of oatmeal, cracked wheat, hominy, soups, meats, stews, and many kinds of fruit can all be done safely and thoroughly at night. Dieteries for foods cooked in this way are prepared, providing for the necessary elements of customary nutrition, at prices from 95 cents to \$2 per week. At present the price of life to about nine-tenths of the people of this land of abundance comes to one half or more of their income. At \$52 per year, the food necessary to sustain 50,000,000 adults, the equivalent of a population of 65,000,000, could be had for \$3,250,000,000."

The Aladdin Oven.

FOREIGN EXCHANGE may be defined as the rate at which bills of exchange or drafts in one country upon another are exchanged between the two countries. If the bills of exchange drawn in one country on another country equal those drawn in that other country upon it, the exchange between the two countries is said to be at par; but when greater in one country than in the other, the exchange is said to be against that place which has the larger remittances to make.

Professor J. E. Symonds (*Political Economy*, p. 152) gives the following popular explanation:

"As a rule, it is in goods and not in money that nations pay for whatever they import. Suppose that of three countries (A, B, and C), A imported goods to the value of £1,000,000 from B, and B imported goods to the same value from C, and C from A. If the imports were paid for in gold, it would be necessary to send £3,000,000 in gold to discharge the liabilities, and, in the end, it would be found that each country had neither more nor less of gold than at the beginning; for each would have sent and received £1,000,000. The cost and risk of sending all this bullion could evidently be avoided if all the debtors had paid in their debts to some merchant in their own country, and that merchant had then paid the creditors in that country. This is what is practically done, only that instead of a single merchant in each country acting as intermediary, the work is done by various bill-brokers, who buy and sell bills of exchange, which are practically orders to pay, drawn on the several debtors by their creditors. People get what is due to them by selling such bills to a broker; they pay what they owe by buying similar bills. The broker gets a small commission, and the debts are discharged without any bullion passing from country to country. Hitherto we have been speaking of countries which owe the same amount, that they are entitled to receive, tho their debtors and creditors may be very unequally distributed among foreign countries. In practice, of course, this equality of debts and claims seldom exists, and we have next to ask what modifications of the system are introduced in consequence of the inequality. Let us suppose the total debts due from English to Australian merchants amount to £7,000,000, and the total due from Australians to Englishmen amount to £5,000,000. If we exclude from consideration all other countries, we see that it is possible to cancel £5,000,000 of English indebtedness against the Australian indebtedness in the manner we have described above. This would save the cost and risk of sending £12,000,000 half round the world; but there are still £2,000,000 to be sent. . . . In practice the amount would be sent by English brokers; but they would charge a premium, in addition to their commission, in return for the service they were rendering to the English debtors; on the other hand, the brokers would be willing to pay some premium to each Australian debtor who buys from them, for such a bill diminishes the amount of the balance that has to be sent to Australia. In the case we have mentioned, the rate of exchange is said to be *against* England. The phrase simply means that people must pay a premium for the convenience of bills payable in Australia, in addition to the broker's commission and the nominal value of the bill, and the explanation of this necessity lies in the fact that they are increasing the amount of bullion that has to be sent half round the world. . . .

"The rate of exchange, as explained above, is due to the balance of indebtedness. If, however, the currency of either country is debased (say, by the use of unconvertible paper), there will of course be a modification of the rate of exchange, since the nominal debt, reckoned in the debased currency, will be greater than if it were reckoned in gold. It is therefore usual to employ the expression *real exchange* for that which grows out of the balance of indebtedness; and to speak of the *nominal exchange* when referring to variations due to the condition of the currency.

"If the relation between two countries were simply that of buying and selling, and if all payments were made in bullion, each country's imports and exports would be of the same value. This is implied in the very nature of a sale. If the only relation between England and America was that we bought cotton and meat to the value of £5,000,000, and sold steel rails to the value of £3,000,000; and if the excess were paid for in gold, it is evident that exactly £2,000,000 would have to be sent in gold. In other words, a country's imports, including bullion, are exactly equal to its exports, so far as these grow simply out of direct sales. But as a matter of fact we do not find this equality. The imports of the United Kingdom greatly exceed its exports. Taking, for instance, the year 1886, we find that the excess was over £80,000,000. In 1883 it was over £120,000,000; and altho the excess varies from year to year, it always amounts to a gigantic sum. Many people regard this fact with alarm. They say, in effect: 'We are in the position of a man living beyond his income, of a manufacturer who habitually buys more than he can sell. We must be either running into debt, or steadily trenching upon our capital.' In reality, however, we are doing neither of these things. A manufacturer may buy more than he sells, and yet not be advancing toward ruin. His income

Excess of Imports over Exports.

may be partly derived from gifts (say from a son in the colonies), and partly from the interest on some capital he has invested, and partly from the remuneration for services he is rendering (say in carrying the goods of some other tradesman). Now England is in the position of such a manufacturer. . . . In order to make this clearer, let us take in turns the three sources of income we have referred to :

"(1) *Gifts*.—A youth has crossed the Atlantic and prospered as a colonist. He sends £200 a year to the old folks at home. He sends it in the form of a bit of paper, which is in effect an order on some English banker. But, as we have already seen, it is by no means certain that any gold will be sent from America to pay the remittance. It may be more profitable to send cotton. This ranks, of course, as an import into the United Kingdom, and accounts for a portion of that excess which some people regard with horror. In reality it is a free gift, a pure increase to the wealth of England.

"(2) *Interest on foreign investments*.—The same considerations apply to this source of national income. Englishmen have invested money in foreign railways. They receive their interest nominally in money. But what actually comes to England may be any of the products of the indebted country. It swells the excess of imports, and is an enriching, not an impoverishing of the country.

"(3) *Payment for services not embodied in commodities*.—This item is more analogous to ordinary trade. When a country sends exports to pay for imports, it is really exchanging services for services. There is a similar exchange when the services rendered by either country are not embodied in commodities. Suppose America sent us not only cotton, and received from us only cotton goods, but that the trade was all carried on by Englishmen, in English vessels, it is plain that the cotton would have to remunerate not only our manufacturers, but also our shipbuilders and sailors. There would be an excess of imports over exports."

The main causes for fluctuations in exchange value are the balance of trade between different countries. If dealers in one country, A, sell in another, B, goods of more value than dealers in B sell in A, the balance of trade is said to be against B. Consequently quotations in A for the notes of B declines. But B may owe another country, C, money in trade, and C may owe A. Hence bills of C drawn on B may be sent to A, and so the former depression of the money of B in A is balanced by the depression of the money of A in B. Foreign exchanges thus play a large part in settling the debts of one country to another.

Again, money goes where it is of greatest value. If the discount in one country rises, money tends to go there. If in any country there is lack of confidence, money is sent away for safe keeping. If in any country merchandise and securities are depressed, money tends to go there to purchase them unless there is too great a lack of confidence.

Palgrave's *Dictionary of Political Economy* gives the following axioms as controlling the rate of exchange :

"(1) The current rate of exchange is the price of a bill of exchange. (2) This is governed by the ordinary laws of supply and demand. (3) The rate of exchange at A for checks on B tend to correspond with the rate at B for checks on A. (4) Most bills are drawn at usance, varying from 30 days to six months, and the usual exchange quotation applies to bills at usance. (5) As the bills on London vastly outnumber those drawn on abroad from London, the demand and supply of the former exercises a proportionately greater influence over the course of the exchange—i.e., the actual rise or fall takes place on the foreign market, and London usually merely adjusts its rates by the telegraphed quotations. (6) In those countries where the value of the currency oscillates in relation to gold, the exchange is subject to two sets of fluctuations, the fluctuations of exchange proper and the fluctuations in the value of the currency. See VALUE; GOLD; SILVER.

FORESTRY is the art of planting, cultivating, and maintaining forests. The important part played by wood in modern life, coupled with the fact that the supply of wood is dependent upon the slow growth of trees, so that the supply for one generation depends upon the action taken by a preceding generation, makes it unsafe to leave forestry to the play of individual interests. Consequently all civilized governments appoint forestry commissions or departments to see that existing forests are not wasted, and the supply carefully maintained. In the United States, with our once seemingly inexhaustible supply, little in this direction has been done until recently, and even now those who are informed declare that we have as yet by no means taken adequate measures.

According to the chief of the Forestry Division of the Department of Agriculture, the total forest area of the United States (exclusive of Alaska and Indian reservations) is 495,000,000 acres. He states that at the present rate of cutting, the remainder of forest land in the United States cannot long meet the enormous demands on its resources. Of the two most important timbers for building purposes, the merchantable white pine of the Northwest and of New England is practically gone, very little remaining, and there remains of the merchantable long-leaf pine of the South only about 1,500,000,000 cu. ft. The valuable ash will probably be the first to be exhausted. Walnut and tulip trees are also on the wane.

The present annual requirements for consumption of forest products in the United States are, approximately, over 24,000,000,000 cu. ft., made up of the following items : Lumber market and manufactures, 5,000,000,000 cu. ft. ; railroad construction, 600,000,000 cu. ft. ; charcoal, 250,000,000 cu. ft. ; fences, 500,000,000 cu. ft. ; fuel, 18,000,000,000 cu. ft. ; mining timber, 150,000,000 cu. ft.

According to Mr. J. E. Jones, writing in the *Cosmopolitan*, not less than 45,000,000 acres are cut over annually. Fires, however, are the worst foes of American forests. They have been estimated to destroy \$12,000,000 of woods annually. In 1894 this is said to have been lost in Minnesota and Wisconsin alone. Railroads have done much harm cutting timber right and left. Settlers have taken much in spite of various congressional laws. (See PUBLIC DOMAIN.) An American Forestry Association (formerly Congress), composed of delegates from all the States, was founded in 1881 and meets annually.

By act of March 3, 1891, the President is authorized to make public forest reservations. Seventeen such, comprising 17,500,000 acres, have been established in Colorado, New Mexico, California, Arizona, Wyoming, Oregon, Washington, and others are under consideration. A bill to provide a systematic forest administration for these was passed in both houses of the last Congress, but failed to become law.

Some of the States have passed forestry laws, and arbor days (*q.v.*) have been generally established ; yet by no means is enough being done. Germany, France, and Switzerland are largely increasing their government forest lands, and they bring in considerable revenue.

References: *A Monograph of the American Economic Association* in May, 1891; also Reports of the Department of Agriculture.

FOUNDLING HOSPITALS.—In ancient times infanticide, at least by exposure, was frequent. Aristotle and Pliny the elder defended it. Institutions for the rescuing of exposed children do not seem to have been wholly unknown, but the first foundling hospital, or hospital for the receipt of infants abandoned by their parents, appears to have been established by the bishop at Treves in the sixth century. The first authenticated one is that at Milan, probably established in obedience to Article LXX. of the Council of Nice. This was copied elsewhere, the usual way being to receive the infants in a marble basin in front of the cathedral. In the Middle Ages, foundling hospitals existed in all the large continental cities, tho the system was early abolished in Germany. In France it was early condemned as leading to vice, but defended as preventing infanticide, and continued. The revolutionary government of France in 1790 called such children *enfants de la patrie*, and decreed that every pregnant girl should receive a premium of \$24. This was abolished in 1811, but foundling hospitals maintained. They exist in large numbers in France and Spain, and to a less extent in other countries. Those in Russia are the largest. The medieval device long used in France, and perhaps still used there in some parts of the country, consisted of a double cradle. When the child had been placed in the cradle on the outside of the building, the contrivance was revolved, ringing a bell as it turned. By this process the child was placed in the institution and another cradle was waiting at once for the next comer. The purpose of these "*tours*" was to make it so easy to get rid of babies that there might be no temptation to infanticide. The agitation for the abolition of this system of admission was bitterly resisted, Lamartine speaking of it as a case of "*figures vs. humanity.*" When the *tours* had been suppressed in some of the departments, attention was called to the fact that infanticide increased thereafter. But further examination of the statistics showed that infanticide had also increased in those departments where the *tours* were still in operation; in fact, it had increased faster in the latter than in the former. From 1869-73 there were received 5076 infants, of whom 2037 died.

A cradle was formerly placed in the vestibule, in which infants could be placed without observation from those inside. At last, however, they began to come two or three in a single night; so now the cradle is put inside the door, and an applicant must ring the bell. If a mother brings her child, she is asked to stay and nurse her child and another. If she refuses, she is allowed to depart without further question, leaving the infant. Perhaps a majority of foundling hospitals in the United States make no adequate investigation as to the parenthood. The general opinion of those most scientifically studying the care of dependent children is growing strongly against foundling hospitals and in favor of receiving abandoned or needy children and placing them in families.

The Massachusetts State Board of Lunacy

and Charity, following the example of the Massachusetts Infant Asylum, boards out infants in the country villages about Boston, placing them with women who bring them up by artificial feeding. About \$10 per month is paid for the board of each child, and clothing is furnished by the officials. (See DEPENDENT CHILDREN.)

FOURIER AND FOURIERISM.—François Charles Marie Fourier was born at Besançon in 1772. Well educated and much traveled, but losing his property in the Revolution, he served two years in the army, and later entered business in Lyons. In 1803 he published an article on European politics. Becoming interested in social questions, he published anonymously his *Théorie des Quatre Mouvements* (2 vols., 1808). He believed that the full indulgence of human nature, with all its passions, would produce happiness and virtue. Society he would harmoniously organize in groups (phalanxes) of 1600 persons, to inhabit a phalanstery, a certain proportion to do one kind of work, others other kinds, and to regulate their time so as to harmoniously develop all sides of life. In 1812 the death of his mother put him in possession of a small sum of money, with which he retired to Bellay in order to perfect his second work. The *Traité de l'Association Agricole Domestique* was published in two volumes at Paris in 1822, and a summary appeared in the following year. After its publication, the author proceeded to Paris in the hope that some wealthy capitalist might be induced to attempt the realization of the projected scheme. Later, he became in Paris clerk in an American firm. In 1829 he published *Le Nouveau Monde Industriel*. In 1831 he attacked the school of St. Simon (*q.v.*). He now began to gain followers, particularly Victor Considérant (*q.v.*), who published in 1834 his *Destinée Sociale*, the most important work of this school. In 1832 a newspaper was attempted, and, with many interruptions, published, till it was suppressed in 1850. In 1832 Baudet Dulary became a convert, and proceeded to establish a phalanstery at Condé sur Vesgre, but it soon failed.

Not discouraged, Fourier lived in the expectation that some rich man would appear and carry out his ideas. He announced that he would be at home every day at a certain hour to receive the rich man, and is said to have done so each day till his death in 1837.

Fourierism has been frequently described, sometimes in ridicule, sometimes in admiration. Henry James, Sr., says of Fourier's writings:

"Every one who trusts in a living and therefore active God, in that God who is quite as active and original in our day as He was 6000 years ago—in short, every one whose hope for humanity is alert, behooves to acquaint himself forthwith with the marvelous literature of socialism. You will doubtless find things of an apostolic hardness to the understanding; you will find many things to startle, many things perhaps to disgust you; but you will find vastly more, both in the way of criticism and of constructive science, to satisfy and invigorate your understanding, while such glimpses will open on every hand of God's ravishing harmonies yet to ensue on earth, that your imagination will fairly ache with contentment and plead to be let off."

John Stuart Mill says (*Political Economy*, Book II., chap. i., sec. 4):

"The most skilfully combined, and with the greatest foresight of objections, of all the forms of socialism, is that commonly known as Fourierism. This system does not contemplate the abolition of private property, nor even of inheritance; on the contrary, it avowedly takes into consideration; as an element in the distribution of the produce, capital as well as labor. It proposes that the operations of industry should be carried on by associations of about 2000 members, combining their labor on a district of about a square league in extent, under the guidance of chiefs selected by themselves. In the distribution, a certain minimum is first assigned for the subsistence of every member of the community, whether capable or not of labor. The remainder of the produce is shared in certain proportions, to be determined beforehand, among the three elements, labor, capital, and talent. The capital of the community may be owned in unequal shares by different members, who would in that case receive, as in any other joint-stock company, the proportional dividends. The claim of each person on the share of the produce apportioned to talent is estimated by the grade or rank which the individual occupies in the several groups of laborers to which he or she belongs, these grades being in all cases conferred by the choice of his or her companions. The remuneration, when received, would not of necessity be expended or enjoyed in common; there would be separate *ménages* for all who preferred them, and no other community of living is contemplated than that all the members of the association should reside in the same pile of buildings, for saving of labor and expense, not only in building, but in every branch of domestic economy; and in order that, the whole of the buying and selling operations of the community being performed by a single agent, the enormous portion of the produce of industry now carried off by the profits of mere distributors might be reduced to the smallest amount possible.

Fourierism. According to the Fourierists, scarcely any kind of useful labor is naturally and necessarily disagreeable, unless it is either regarded as dishonorable, or is immoderate in degree, or destitute of the stimulus of sympathy and emulation. Excessive toil need not, they contend, be undergone by any one, in a society in which there would be no idle class and no labor wasted, as so enormous an amount of labor is now wasted, in useless things, and where full advantage would be taken of the power of association, both in increasing the efficiency of production and in economizing consumption. The other requisites for rendering labor attractive would, they think, be found in the execution of all labor by social groups, to any number of which the same individual might simultaneously belong, at his or her own choice; their grade in each being determined by the degree of service which they were found capable of rendering, as appreciated by the suffrages of their comrades. It is inferred, from the diversity of tastes and talents, that every member of the community would be attached to several groups, employing themselves in various kinds of occupation, some bodily, others mental, and would be capable of occupying a high place in some one or more; so that a real equality, or something more nearly approaching to it than might at first be supposed, would practically result: not from the compression, but, on the contrary, from the largest possible development, of the various natural superiorities residing in each individual.

"Even from so brief an outline, it must be evident that this system does no violence to any of the general laws by which human action, even in the present imperfect state of moral and intellectual cultivation, is influenced, and that it would be extremely rash to pronounce it incapable of success, or unfitted to realize a great part of the hopes founded on it by its partisans."

Says Professor R. T. Ely (*French and German Socialism*, p. 91-94):

"The central idea of Fourier's social scheme is association. The all-pervading attraction which he discovered draws man to man and reveals the will of God. It is passionate attraction—*attraction passionnelle*. It urges men to union. This law of attraction is universal and eternal, but men have thrown obstacles in its way so that it has not had free course. Consequently, we have been driven into wrong and abnormal paths. When we return to right ways—

His System. when we follow the directions given us by attraction, as indicated in our twelve passions or desires—universal harmony will again reign. Economic

goods—an indispensable condition of human development—will be obtained in abundance. Products will be increased manifold, owing, first, to the operation of the passion to labor and to benefit society; secondly, to the economy of associated effort.

"A social organization must be formed which will allow free play to our passions, so that they may combine harmoniously. Our present society, called civilization, does not, and cannot, do this. It is a system of oppression and repression, and is necessarily a frightful discord. Harmony can only be found in combinations of suitable numbers in communities known as phalanxes, and occupying buildings called phalansteries. Each phalanx is a unit, a great family, and dwells in a single building, a phalanstery. What is it that determines the proper number for a single phalanx? It is again the twelve passions of man. These can be combined in 820 different ways in as many individuals, and no possible combination ought to be unrepresented in the workers of any phalanx, or there will be a lack of perfect harmony. But in every community there will be found old men, infants, and those disabled on account of illness or accident. Provision must also be made for absences. There ought not, then, to be less than 1500 or 1600 members in a phalanx, tho 400 is mentioned as a possible but undesirable minimum; 1800 to 2000 members are recommended. A larger number would produce discord, and is, therefore, inadmissible. But a further arrangement is necessary. These different characters thrown together helter-skelter would no more produce harmony than it would for one blindfolded to draw from a bag 2000 combinations of notes for the piano and play them in the order in which they were drawn. On the contrary, they must be ordered intelligently in series, the series combined into groups, and the groups into the phalanx."

But when Fourier fell to arranging his phalanx he let his ideas run away with him into amusing absurdities. He maintained that if England would introduce his phalanxes her labor would become so productive that she could pay off her national debt in six months by the sale of hens' eggs. He would divide the time in his phalanxes into fixed mathematical divisions, allotting certain periods for study, for work, for amusements, for love-making, etc. He thought that his mathematical harmonies enabled him to understand the world and the universe. The chief of a phalanx is a unarch. The next highest officer is at the head of three or four phalanxes, and is called a duarch. Triarchs, tetrarchs, pentarchs, etc., follow; while the highest officer of the world is the omniarch, who dwells at Constantinople, the capital of the world.

The duration of the human race on earth, he held, would be 80,000 years, divided into two periods of ascending and two of descending vibrations. Lions would be taught to draw wagons, as a symbol of the victory of man over nature. His conception of the relation of the sexes, altho giving vent to some noble thoughts about the freedom of woman, was, to say the least, contrary to conventional views, and, according to some, utterly gross and immoral. Such are some of the fantasies that mingled with Fourier's profound thoughts. On his tombstone were inscribed words which were considered to give the key to his whole system:

"Les attractions sont proportionelle aux destinies, La serie distribue les harmonies."

Fourierism from 1840-50 swept over the United States like a wave. Brisbane presented its ideas in his *Social Destiny of Man*. Horace Greeley opened the columns of the *New York Tribune* to its teachings. Phalanxes were organized by the dozen. The North American phalanx had a capital of \$8000, and endured twelve

years. Brook Farm (*q.v.*) became a Fourierite phalanx. By 1855, however, all had disappeared. The Familistère at Guise, erected by Godin (*q.v.*) in France, is the only existing monument of Fourierism save the ideas in his works. (See SOCIALISM.)

FRANCE AND SOCIAL REFORM.—

Referring the reader to various articles for details, we give here a summary of statistical information, and of the development of social reform in France.

I. STATISTICS.

France, a republic since the overthrow of Napoleon III., September 4, 1870, vests its executive power in a President and Ministry, and its legislative power in a Senate and Chamber of Deputies. The President is elected for seven years by the Senate and Deputies united. He selects his Ministry from the Chamber, and appoints to all civil and military posts. With the consent of the Senate he can dissolve the Chamber of Deputies. The deputies are elected for four years by the votes of all males over 21 who have resided six months in one commune. (See ELECTIONS.)

Constitution. The Chamber has 584 deputies, representing, in 1893, 10,446,178 inscribed electors. The Senate has 300 members elected for nine years from citizens 40 years old, one third retiring every third year. They are chosen by an electoral body of delegates of the municipal council of each commune and the deputy councilors, general and district councilors. The Senate and Chamber assemble every January, and must remain in session at least 5 months out of 12. Senators and deputies are paid \$800 per year, with free travel on State railways. France is divided into 87 departments (3 in Algeria), with 36,144 communes. The commune is under a municipal council and each department under a prefect, who represents the executive and must approve all acts of the council. Each municipal council elects a mayor, who is, however, under the prefect. Paris (*q.v.*) has no mayor, tho each *arrondissement* (division) has a *maire*. The *arrondissement* is a district (562 in France) with an elected *conseil d'arrondissement*.

The population, April 21, 1891, was 38,243,192 on an area of 204,092 sq.m. According to the *Annuaire de l'Economie Politique et de la Statistique* for 1895 (p. 15), the marriages, divorces, and relation of births to deaths was as follows:

YEAR.	Marriages.	Divorces.	Births.	Excess of Births over Deaths.
1887.....	277,060	3,636	899,333	56,536
1888.....	276,848	4,708	882,639	44,772
1889.....	272,934	4,786	880,579	85,646
1890.....	269,332	5,457	838,059	—38,446*
1891.....	285,458	5,752	866,377	—10,505*
1892.....	290,319	5,772	855,847	—20,041*
1893.....	287,294	6,184	874,672	7,146

* — indicates excess of deaths over births.

According to the same authority (p. 20), the following was the population in 1891, according to occupations:

OCCUPATION.	Employers and Employed.	Population.
Agriculture.....	6,535,599	17,435,888
Industry.....	4,548,098	9,532,560
Commerce.....	1,738,631	3,961,496
Public service.....	561,875	715,624
Public administration.....	240,269	699,611
Professions.....	527,976	1,114,873
Living on income.....	1,075,811	2,169,750
Unclassified.....		1,304,250

OCCUPATION.	Em-ployers.	Clerks, etc.	Work-men.
Agriculture.....	3,570,016	75,400	2,800,183
Industry.....	1,021,659	207,222	3,319,217
Commerce.....	879,969	378,318	480,344
Transport.....	62,501	138,707	245,979

In 1881 there were in France 29,201,703 Roman Catholics, 692,800 Protestants, and 7,684,906 who declined to make declaration of belief. In the budget for 1896 the State allows \$52,000 to the Administration for religion; \$8,431,395 to Roman Catholics; \$308,380 to Protestants, and \$13,506 to Jews. There are 17 archbishops and 67 bishops; 42,347 ecclesiastical officials were paid by the State in 1894. At the end of 1892 there were 55,600 secular clergy (including teachers). In 1894 there were 638 pastors of the Reformed Church and 62 Lutheran. (For EDUCATION, PAUPERISM, ARMY, see those articles.) The courts are justices of the peace, police courts, police correctional courts, courts of assizes (with 12 jurors), 26 courts of appeal, and 1 court of cassation. All judges are nominated by the President. For further details on this phase of the subject see general article on CRIME.

Religion.

The budget for 1896 is as follows:

REVENUE.	Francs.
Land tax:	
Land.....	118,607,919
Buildings.....	80,042,227
Personal property.....	90,470,476
Doors and windows.....	58,425,474
Trade licenses.....	125,580,402
Tax "d'avertissement".....	1,954,100
Carriages, horses, and other special taxes.....	47,920,585
Registration.....	555,689,500
Stamps.....	188,402,500
Customs.....	469,270,230
Other indirect taxes.....	588,343,000
Tax of 4 per cent. on movables.....	66,220,000
Sugar.....	196,473,000
Tobacco monopoly.....	376,301,800
Posts and telegraphs.....	215,014,359
Domains and forests.....	45,019,420
Various revenues.....	10,318,862
Matches and gunpowder.....	39,059,300
Exceptional resources.....	57,372,575
Receipts <i>d'ordre</i>	64,816,354
Total, Algeria.....	53,015,019
General total.....	3,448,317,993
EXPENDITURES.	
Public debt.....	1,219,792,036
President, Chamber, and Senate.....	13,171,720
Finance.....	19,471,260
Ministries:	
Justice.....	35,320,233
Foreign affairs.....	15,984,800
Interior, France.....	75,786,209
War.....	651,174,820
Marine.....	272,514,898
Colonies.....	79,018,500
Public instruction.....	195,018,342
Fine arts.....	8,148,985
Worship.....	44,125,953
Commerce, industry, posts, telegraphs.....	198,213,197
Agriculture.....	30,115,000
Public works.....	270,639,764
Expenses of Régie, collecting taxes, etc.....	204,669,771
Repayments, etc.....	40,842,000
Total Algeria.....	74,010,620
General total.....	3,447,918,198

For 1804 the estimated ordinary revenue of the communes of France was \$143,818,000, with an expenditure of \$136,330,145, and debt, March 31, 1803, of \$659,383,225. This includes \$609,401,767 revenue, \$60,381,688 expenditure, and \$778,566,603 debt for Paris. The exports from France were, in 1804, \$825,000,000 for special commerce and \$313,000,000 for general commerce and special commerce goods of French origin or (if imported) for French consumption.

Commerce.

The imports for 1804 were \$959,000,000 general and \$770,000,000 special. The chief imports, millions of dollars, in 1804, were: Cereals, \$73,000,000; raw wool, \$673,000,000; oil seeds, \$39,000,000; raw cotton, \$36,000,000; coal, \$34,000,000; timber and wood, \$30,000,000; wine, \$29,000,000. The chief exports were: Woolen textiles, \$48,000,000; wine, \$46,000,000; silks, \$45,000,000; small ware, \$31,000,000. In 1804, \$93,000,000 of the imports were from Great Britain and Ireland, \$74,000,000 from Belgium, \$65,000,000 from the United States, \$62,000,000 from Germany. Of the exports, \$183,000,000 were to Great Britain and Ireland, \$95,000,000 to Belgium, \$65,000,000 to Germany, and \$36,000,000 to the United States.

The mercantile navy had, December 31, 1804, 14,332 sailing vessels and 1196 steamers. See RAILWAYS; TELEGRAPHS; POSTAL SAVINGS BANKS, etc. For French agriculture, see AGRICULTURE. The product of her mines in 1803 was 337,896,000 francs. See also FISHERIES; RAILWAYS, etc.

The number of savings banks (*caisses d'épargne*) in 1803 was 544. Of these, 450 were under the control of the municipal councils; 56 wholly independent. They had 1079 branch offices (*succursales*), and deposits to the value of 3,244,494,413 francs. The postal savings banks had 674,318,599 francs.

II. SOCIAL REFORM.

Modern social reform in France, as elsewhere, rests upon the past.

Ancient Gaul, more thoroughly Latinized than any other Roman province outside of Italy, fell a rich prize to the Gothic invaders, and they here developed some of their richest cities and strongest States. Only gradually did Paris raise herself above other cities and develop in France a strongly centralized government, a process largely necessary to rescue France from the weakness in which she was left by the long English wars. Yet all through the country lay the traditions of much independence for the communes or townships and local divisions. These communes, especially those of the larger cities, stood repeatedly for their rights, and treated with the king sometimes as all but equals. But the process of centralization went on apace. When, in 1358, the Jacquerie rose, under Étienne Marcel, to battle for constitutional liberty, they were mercilessly put down. The Reformation was suppressed in France for political reasons, and the suppression aided the central government. The court of the Louis became more brilliant, more despotic, more corrupt than any other court in Europe. The result could be but a revolution. The French Revolution (*q.v.*) did only what has been done in all other Western countries—it freed the bourgeoisie. The French Revolution was largely produced by English ideas. The philosophy of Rousseau and still more of the Encyclopedists came from the school of Locke. But it took in

History.

France, perhaps because of the Gallic character, a more revolutionary and more radical form. The genius of Rousseau, the writings of Mably, of Morelly, of Boissel, of Brissot de Warville, even the land views of the Physiocrats, filled France with new ideals of the rights of man, and with the conception of government as only just when

resting upon the consent of the governed. It is doubtful if the French masses at the time of the Revolution were suffering more than the dwellers in England's manufacturing centers and in her agricultural hamlets during the same period. But the despotism of the Louis gave to the Revolution a violent form. Nowhere else could a Louis say, "I am the State;" nowhere else did absolute monarchy go down in such a whirlpool of passion. The suppression, too, of the French Reformation, the infidelity of the Encyclopedists, the wit of Voltaire, had deprived France of faith. The Revolution came "a truth clad in hell fire," yet a truth, and a necessary one. Napoleon's cannon put down the Revolution, but could not put down ideas. It could only make France the scene of constant revolution and insurrection.

With Louis XVI., in 1792 (guillotined in 1793), the house of Bourbon, which had ruled since 1589, commencing with Henry IV., met its fall, and we have the First Republic. From 1793-95 the Convention ruled; from 1795-99 the Directory; from 1799-1804 Napoleon as Consul. Then came the First Empire, from 1804-14, under Napoleon I. (died 1821). In 1814 the house of Bourbon was restored, with Louis XVIII., 1814-24; Charles X., 1824-30. After the Revolution of 1830 we have the rule of the house of Bourbon-Orleans under Louis Philippe (1830-48). Then comes the Revolution of 1848, and the second Republic, from February to December, 1848, under the Provisional Government; from 1848-52 under Louis Napoleon. In 1852 the empire was restored under Napoleon III., who died in 1873. In 1870 we have the declaration of the third Republic and the government of National Defense, in 1871 the uprising of the Commune, and the presidents Louis A. Thiers (1871-73), Marshal MacMahon (1873-79), F. J. P. Jules Grévy (1879-87), M. F. Sadi Carnot (assassinated June 24, 1893), Casimir Périer (1893-95, resigned), and Felix F. Faure (1895).

Such is the bare chronicle of the constitutional changes that have swept over France during the century. There have been continual smaller changes and uprisings and ministerial crises which we cannot chronicle here. Through them all has gone the struggle for a republicanism more or less modified by the communistic ideas connected with the old communes.

Sixty years before Proudhon, Brissot de Warville, in 1776, the year of Adam Smith's *Wealth of Nations*, the year of American independence, had declared that property (as ordinarily understood) was theft. Babœuf was the first to battle for communism, in his attempted insurrection of 1797, but held as his ideal an utterly artificial dead equality to be rigidly enforced by the State. Insurrection crushed, thought was the only outlet. We come, therefore, to a long period of utopian socialism. Details of each author and school will be found under their separate names; we do little more than chronicle them here, to bring out the continuity. Fourier in 1808 published his *Théorie des Quatre Mouvements*, with its strange blending of mathematical formulas, of far-reaching thought, and of impractical sug-

Constitutional
Changes.

gestions for artificial association and forced harmonies. It produced in 1834 Considérant's *Destinée Sociale*, and his attempted phalansteries in France and far away in Texas; besides this it led to Godin's famous Familistère at Guise (1859), to the great wave of Fourierist communism that swept over the United States from 1840-50. Meanwhile Saint-Simon, an aristocrat, became revolutionary, dreamed in 1817 of an industrial scientific collectivist State, and in 1825 of a *Neo-Christianity*, a church which should introduce social reform. Calling upon the Pope to lead in this, on his refusal Saint-Simon attempted a "religion" of his own, which Bazard and Enfantin developed into brief popularity and still briefer experiment from 1830-33. In 1840 Cabet published his *Voyage en Icarie*, and the colony to Icaria in America was started in 1843. Meanwhile, Colins, Huet, and others were writing, while from England came the theories of Owen and the reports of Chartism. This long period of utopian socialism was broken by the July Revolution of 1830, and the almost constant attempts of radicals and revolutionists like Blanqui (*q.v.*) to rouse the Paris Commune.

In 1848 the Revolution of that year and the declaration of the republic gave great hopes to the radicals, and the socialists, mainly under the lead of Louis Blanc, demanded government shops for the unemployed. The provisional government nominally yielded, but appointed a committee constructed to procure the mismanagement of the plan—a trick openly denounced by Louis Blanc. (See ATELIERS NATIONAUX.) The election of Louis Napoleon to the presidency and the *coup d'état* of December 2, 1851, whereby the empire was declared, put an end to the hopes of the socialists till the overthrow of the emperor in 1870, the declaration of the third and present republic. Conceiving it but a sham bourgeois republic, the Commune of Paris rose March 18, 1871, but were eventually defeated by the armies of the National Government. (See PARIS COMMUNE.) Meanwhile, the International had been planted in France, and under the influence of Bakounin, and influenced by the traditions of the old communes, had developed an anarchistic communism. The communards of Paris, scattered after the Commune, declared mainly for anarchism. But after a season some of the leaders became convinced of the impracticability of anarchism, and advocated socialism of the Marxist types. In 1879 amnesty was granted to communards, and Guesde, Brousse, Malon, and others returned Marxist socialists. A strong party was developed for collectivism. The *Égalité*, the *Proletaire*, the *Droits de l'Homme*, more or less formally committed to collectivism, at least spread the thought. The *Cri du Peuple*, founded and edited by Jules Vallès, had, since 1876, favored Socialism. Collectivist ideas began to dominate the trade-unions. General congresses of working men were held at Paris in 1876 and Lyons in 1878, and were largely socialistic. The Congress of 1879 at Marseilles was socialist in everything except name.

But collectivism was not easily to triumph.

French communist anarchism was still strong, and represented by men of ability and standing, like Kropotkin and Reclus, still more by a spirit of intense and fanatic devotion, such as has furnished the modern dynamiters, a Vaillant and a Henri. It had an organ of marked literary ability, *La Révolte*, founded by Kropotkin in Geneva and transferred to Paris; it had a paper, *Le Père Pénard*, written in Parisian argot, and appealing to the workmen of the streets with impassioned violence. Not at once did French socialism clear itself from such anarchism. The socialist movement became divided. The right wing was for bargaining with the political radicals and for practising cooperation, and was hence called Opportunist or Cooperatist; the left wing worked with the anarchists; only the center was for Marxian collectivism. In 1880, at the Congress at Havre, division became open. The majority favoring independent political collectivist agitation, the right wing, which desired to work through existing political groups, defected, and formed the Alliance Socialiste Républicaine, and held congresses of its own at Paris in 1881 and Bordeaux in 1882. The anarchist wing renounced socialism altogether. The great majority, the center, thus free to act, declared for Marxian socialism, and formed themselves into the Parti Ouvrier Socialiste Révolutionnaire de France. This organization held a congress at Rheims, November 21, 1881, and declared *Le Proletaire* its organ.

But even this organization itself divided. The question was whether to agitate for a complete socialist program at once, or for portions of it step by step, as might seem at the time possible. Those accepting the latter policy were called Possibilists, the former Guesdists, from their leader, Jules Guesde. Still another division took place. M. Brousse split the Congress of 1882, at St. Étienne, on a vote endorsing, instead of a centralized collectivism, a decentralized one based on the communes. He carried his point, 36 to 27, and formed the Broussist group, which soon became one of the largest, and in 1889 succeeded in electing M. Joffrin to the Chamber of Deputies, while it has frequently had nine members in the Municipal Council of Paris. Brousse himself, however, as we have seen, always changeable, now calls himself a Republican radical. Besides these groups there exists, mainly in the Chamber of Deputies, still another group, founded by followers of the old communist Blanqui, and hence called Blanquists.

Such are still to-day the main French socialist groups, save that the Alliance Socialiste Républicaine has practically ceased to exist, and that the Possibilists who do not follow M. Brousse are now often called Allemanists, from their leader, Jean Allemane, editor of their organ, *Le Parti Ouvrier*. Too much emphasis, however, must not be put upon these divisions. The groups are continually changing, and the French system of the second ballot (see ELECTIONS) allows the socialist groups to vote for their respective candidates in the first ballot, and to unite in the second ballot on the socialist candidate of any group who has received the

Socialism.

most votes on the first ballots. This has enabled the socialists to carry an increasing number of elections. In municipal elections they have the majority in very many cities, and so large a representation even in the Paris municipal council, that they are sometimes in the majority. Even in national elections they have made steady progress. In 1889, the socialists cast only 91,000 votes out of 6,847,000, or 1.30 per cent. In 1891, however, they cast 549,000, or nearly 9 per cent. ; and in 1893 at least 900,000 votes, increasing the number of their deputies from 15 to 53, without counting such socialist radicals as MM. Goblet and Pelletan, who are now, however, declared socialists. A French writer, in the appendix to Professor Ely's *Socialism and Social Reform* (1894), gives the following statements as to the various groups :

"The socialistic party has no representatives in the Senate. In the Chamber of Deputies there are about 60 socialistic deputies (53 socialists and 7 socialist radicals), among whom the following are the most important in each group : "Collectivists : MM. Guesde, Chauvin, Pierre Vaux.

"Blanquists : MM. Vaillant, Chauvières, Walter (recently Mayor of St. Denis), Ernest Roche.

"Possibilists (Broussists) : MM. Prudent-Dervilliers, Lavy.

"Possibilists (Allemanists) : MM. Fabérot, Groussier, Coutant, Dejeante, Avez, Toussaint."

Socialism, however, altho the largest movement, is by no means the only social reform movement. The anarchist communists have not yet disappeared, as witnessed by the bombs thrown by Vaillant in the Chamber ; Henri, in the Café Terminus ; and the assassination of President Carnot.

These terrible deeds have caused the suppression of the anarchist papers referred to above, and the deportation of most of the leaders, but thought is not thus suppressed.

The trade-union movement of France is largely identified with the political movement, tho not wholly. The old guild system was overthrown in 1791, and working men's organizations placed under a ban.

Trade- Unions.

Napoleon I. undertook to establish compulsory organizations of employers and employees, with the employers in control, but with little success. Gradually, however, working men's unions developed. They won partially legal recognition in 1864, and complete freedom of organization in 1884. The following tables of French industrial organizations are all taken from the *Annuaire*, quoted above. It should be stated that the word *syndicats* is used for organizations of any kind of employers or employed.

SYNDICATS, OR INDUSTRIAL ORGANIZATIONS IN 1894.

NATURE.	Number.	Federation.	Members.
Employers	1,518	29	122,251
Workmen	2,178	73	408,025
Mixed	177	9	29,124
Agricultural	1,093	15	384,332

BY TRADES.

TRADE.	Employers.	Employed.
Food	491	97
Building	133	406
Clothing	95	249
Metal	46	212
Paper and Printing	70	171
Textile	28	149
Transport	59	84
Wood Workers	33	112
Miners	9	62

The attempt to unite employers and employees in the same organization has not succeeded ; and the temper of the French trade-unionist has grown steadily more radical. Strikes have not played the part in France which they have in some countries, but in the textile trades and mining they have been numerous. The general strike of the miners in 1890 and that of the miners at Carmaux in 1892 were distinguished by increasing bitterness and socialistic utterances. According to the report on France of the (English) Royal Commission on Labor, from 1888-91 there were 1034 strikes, of which 269 were successful and 217 compromised. France has played a leading part in industrial arbitration (see ARBITRATION), with its famous conseils des Prudhommes, and recently the French Government has interfered to try and settle labor disputes, but thus far with small success. The main activity of the Government in relation to labor organizations has been the granting of aid to the labor bureaus, of which there were some 30 in France in 1892. The Paris Bourse de Travail was founded in 1887 with an annual subsidy of eventually 50,000 frs. and a building in the Rue Jean Jacques Rousseau. In 1892 a fine building was provided in the Rue Château d'Eau at a cost of 3,000,000 frs. Lit by electricity, heated and commodious, it became the headquarters of over 200 unions, but was finally closed by the Government in 1894, owing to its having become a headquarters for socialism. The Government is, however, doing a good deal, and proposing more in the way of old-age pensions (*q.v.*), insurance, etc. In 1891 a Higher Council of Labor was organized, of 50 delegates, elected by the *syndicats*, but under the Minister of Commerce.

The French agricultural *syndicats* are a characteristic development, and have served to spread the cooperative idea.

Cooperation in France was early advocated by Fourier and Buchez, sometimes called the father of French cooperation. The revolutionary Government of 1848 took up the idea and voted a loan of 3,000,000 frs. to cooperative societies ; but there was a demand for 27,000,000 frs., and the *coup d'état* checked the growth of the movement. Later cooperative societies have been favored by the Government in freedom from taxation, etc., and have slowly grown. In 1894 there were 110 productive, 39 agricultural, and 980 consumptive cooperative societies, with 24 popular and 125 agricultural cooperative banks. The cooperative society of La Ruche Stéphanoise was organized in Paris as early as 1855.

Profit sharing in France has had not a larger but a stronger development. (See PROFIT-SHARING; GODIN; BEAUMARCHAIS; LECLAIRE, etc.) There were, in 1891, according to the *Rapport sur les Sociétés Coopératives* (p. 60), 92 profit-sharing societies in France. Municipalism in France has a large development (see PARIS), and the national porcelain works at Sèvres, the tapestries of Gobelins and Beauvais, with the 15 national tobacco factories, are thought by some to be the seeds of a future nationalism. (See also CHRISTIAN SOCIALISM; LE PLAY, etc.)

FRANCHISE (ELECTORAL).—(For the principles involved, see DEMOCRACY; STATE.) We give here the qualifications for voting in the leading countries. In the United States, all citizens qualified by their respective States can vote for representatives and Presidential electors. (See ELECTORAL BOARD.) In general,

all male citizens over 21, and in many States all males over 21 who have declared their intention to become citizens, can vote. In most States, registration is necessary. Residence, varying from three months in Maine and Michigan,

to two years in Rhode Island, is necessary in all States. In Massachusetts, voters must be able to read, and in Mississippi to read or understand the Constitution in English. Taxes must have been paid in Delaware, Florida, Georgia, Pennsylvania, and Tennessee. Women, convicts, idiots, paupers, are disqualified in most States. Women can vote in Wyoming and Utah. Colorado has voted for it. The municipal franchise is usually the same. In Kansas, women vote largely on municipal elections; for school boards they vote in many States. The total Presidential vote in 1892 was 12,110,636, in a population of 64,000,000.

In Great Britain, for parliamentary elections, in brief, all householders who have paid their rates, or all lodgers occupying quarters worth £10 a year, or all occupiers of non-residence property worth £10 a year, or owners of town property of that value, provided they live within 10 miles of the town, can vote. One

person can thus have more than one vote. For municipal and school board elections, the qualifications are broader. (See ELECTIONS.) In Scotland, the poorer classes are largely disfranchised by dodging the rates. In England, their rates are usually collected through the landlords, and so more vote; but as the lists are made up from the rate-payers' list, many, especially of the poor and of lodgers, are disqualified, because they have moved. In 1892 the total vote was 4,587,036 in a population of 38,000,000.

In France, all males over 21 who can prove a six months' residence in any one town or commune can vote in municipal or national elections. In 1889 there were 7,953,382 who voted out of a population of 38,000,000 (1891).

In Germany, the members of the Reichstag

are elected by universal suffrage, but by the present division of electoral districts many cities, like Berlin, have less than their proportional representation. In 1890 the voters were 7,261,659 out of a Continental Europe population of 49,428,470. The suffrage of the different States of the empire and of the municipalities are much more limited. Berlin in municipal elections has 13 per cent. less voters than in the national elections. (See BERLIN.)

In Austria (*q.v.*) there has been recently very general agitation for universal suffrage, but there are still numerous property qualifications.

In Switzerland, all males over 21 can vote. On a referendum, November, 1895, 437,000 voted in a population of 2,986,848.

In Belgium, all males over 25 who have lived in one commune one year have one vote, but those over 35, married, with children, and paying 5 frs. a year in house tax, or, tho only 25, having real property of 2000 frs., or its equivalent in Belgian funds, have two votes, while professional men and those with a higher education have three votes. There are about 1,200,000 electors in a population of about 6,000,000. The municipal suffrage is much more limited.

In Holland, voters are those over 23 who pay a small tax. There are 295,000 electors in a population of 4,500,000.

In Italy, men vote who are 21, can read and write, and who pay a small tax. In May, 1895, 1,256,244 voted in a population of about 30,000,000.

FRANCHISES, in social science, means a privilege or grant of a public or semi-public nature conferred on individuals or corporations by governments (municipal, State, or national).

According to the common law, the franchise implies a mutual obligation between the Government and the party holding the franchise. The Government guarantees to strictly carry out the grant of the franchise (the franchise, however, always being strictly construed against the grantee), and the grantee agreeing to furnish the public all the facilities for which the nature of the franchise calls. The owner of a ferry franchise thus can be compelled to continue to run his boats, the failure to do this by common law forfeiting his grants. It is asserted that the Government cannot repudiate or withdraw its franchise, once granted. (But see EMINENT DOMAIN.) Where the charter conferring the franchise, however, contains a clause reserving to the Legislature the right to annul or vary the franchise granted, or where the charter is granted subject to a constitutional provision or general act reserving to the Legislature such a power, it may constitutionally be exercised.

Franchises are not alienable by the owner or owners thereof without express legislative authority. They cannot, therefore, be conveyed or mortgaged of common right. They cannot be taken in execution and sold so as to convey any title to the purchaser.

The conditions upon which franchises are granted are among the subjects which need the most reform in the United States, and have produced the greatest scandals and corruptions,

especially in our municipal governments. Important and valuable franchises are again and again given away for a song to private corporations by corrupt aldermen, bought up by these corporations. European cities, on the other hand, rarely grant a franchise unless the corporation receiving the franchise gives the city high and adequate returns of various kinds. In Berlin, for example, a private company has the franchise to operate street railways, but it only received the franchise on agreeing to pave the streets on which its tracks lie, from curb to curb; to pay a portion of its receipts to the city, amounting to some \$250,000 annually; and in the year 1911 to turn its whole plant over to the city. Compare this with what American cities repeatedly do (to say nothing of notorious "Broadway steals") in giving away valuable franchises for a song, usually because the franchise has been sold by the corrupt Council or Board of Aldermen. (See CORRUPTION; JOBS; MUNICIPALISM.)

Professor Bemis, in a paper on *Some Essentials in the Way of Granting Municipal Franchises*, read at the Minneapolis Conference for Good City Government, 1894 (see Proceedings, p. 123), makes the following points as requisites of a good franchise:

1. The mayor should have the right of absolute veto upon any proposed franchise.
2. Constitutional, or, if that is not possible, a legislative, limitation to the length of time for which future franchises can be given, such term not to exceed 30 years with elevated roads, 20 years with gas works or surface street-car lines, and a much less period for electric-light and telephone companies.
3. The prohibition of renewing franchises until within a year of its expiration, otherwise companies may secure a renewal from a corrupt council before the people are aware of it.
4. The expiration of all franchises for extensions to new streets with the expiration of the franchise on the main system; otherwise the city is prevented from entering on any broad policy.
5. Extensions on new streets made subject to order of the city, with appeal possibly to some court of arbitration.
6. Complete publicity of accounts, with the power and duty vested in the city auditor to prescribe methods of book-keeping.
7. In case of transportation lines, the right of the city to require increase of cars to the capacity of the road when traffic demands it.
8. The express condition that the company receiving the franchise must, at its expiration, if not securing a renewal, sell out to the city or another company that may receive the franchise, at the cost of duplicating the physical plant, independent of any value based on earning power.
9. The sale of the franchise to the bidder offering the cheapest and best service or largest revenue to the city, emphasis being laid on cheap and good service.
10. Two years before the expiration of every franchise, the citizens should have the opportunity to vote on city ownership, and if the latter is carried, the city to own and operate after the expiration of the franchise, with the provision

for the merit system in the civil service, and with the further provision that every five years thereafter for 10 or 15 years, on petition of a certain number of citizens, another popular vote should be had on the question of continuing city management. (See MUNICIPALISM.)

FRANKLIN, BENJAMIN, was born in Boston, Mass., in 1706, of poor parents, the fifteenth of 17 children. Taken from school in his tenth year, he became two years later an apprentice in the printing shop of his brother, who published the *New England Courant*, and for which Franklin early wrote. Owing to difficulties with his brother, he escaped to Philadelphia in his seventeenth year, and almost absolutely destitute. After a series of difficulties and adventures, including a trip to England, he gradually, by hard work and ability, met success. In 1730 he married Miss Reed. He became the editor and proprietor of a paper, *The Gazette*, and in 1732 of *Poor Richard's Almanac*. He became Clerk of the General Assembly in 1736, postmaster in 1737, and representative in 1747. In 1753 he was made deputy postmaster-general for the colonies. In 1757 he went to England, representing Pennsylvania, Massachusetts, Maryland, and Georgia with great success. He addressed Parliament, opposing the Stamp Act, and was consequently deposed from the postmastership. Returning to America, he was a delegate to the Congress of 1775, and signed the Declaration of Independence. In 1776 he was sent as Minister to France, with which country he succeeded in securing an alliance. He raised loans, and in 1782 signed the treaty of peace with England. Returning to Philadelphia, he became president of the Supreme Council of the city and member of the Convention for Revising the Articles of Union. He died April 17, 1790, and Congress appointed a mourning of two months through the States.

He founded the first public library in Philadelphia in 1732, "the mother of American libraries," and led in innumerable municipal improvements. In 1752 he discovered the idea of lighting with electricity, and by his electrical and other scientific discoveries became recognized by and intimate with the scientists of all Europe, and received degrees and honors from numerous English and European universities. In 1752 he organized a scientific society which became the American Academy of Science. Turgot said of him: "*Eripuit celo fulmen, sceptrumque tyrannis.*"

FRATERNAL ORGANIZATIONS.—In England these are usually called friendly societies (*g. v.*). In the United States they are very numerous and play an important part in economic and social development. They are opposed by a small and demonstrative but earnest minority who oppose all secret societies. Many believe they are only needed to-day because the Church and the State do not perform their full duties.

According to the *World Almanac* (1896), the membership of the principal fraternal organizations in the United States and Canada is as follows:

Odd Fellows.....	939,397
Freemasons.....	929,459
Knights of Pythias.....	456,994
Ancient Order of United Workmen.....	341,371
Knights of the Maccabees.....	209,851
Royal Arcanum.....	169,541
Improved Order of Red Men.....	161,498
Junior Order of United American Mechanics..	153,268
Modern Woodmen of America.....	144,493
Knights of Honor.....	121,183
Ancient Order of Foresters of America.....	126,508
Ancient Order of Hibernians of America.....	115,000
Knights and Ladies of Honor.....	84,000
Sons of Temperance.....	59,680
Knights of the Golden Eagle.....	58,535
Order of United American Mechanics.....	55,689
American Legion of Honor.....	55,055
Woodmen of the World.....	52,558
National Union.....	47,625
Catholic Benevolent Legion.....	49,106
Order of Chosen Friends.....	38,095
Catholic Mutual Benefit Association.....	38,000
Ancient Order of Foresters.....	56,825
Equitable Aid Union.....	35,118
Independent Order of B'nai B'rith.....	39,500
Benevolent and Protective Order of Elks.....	27,000
Catholic Knights of America.....	24,000
Improved Order of Heptasophs.....	23,995
Order of the Golden Cross.....	20,257
Royal Templars of Temperance.....	19,210
New England Order of Protection.....	18,429
United Order of Pilgrim Fathers.....	18,100
Order of United Friends.....	17,000
Irish Catholic Benevolent Union.....	15,000
United Ancient Order of Druids.....	14,600
Royal Society of Good Fellows.....	12,270
Smaller organizations not reported.....	73,209
Total.....	4,764,998

According to the report made at the annual meeting of mutual benefit life insurance associations in 1895, their number of members was 3,638,815.

The membership of the Independent Order of Odd Fellows, which includes the grand lodges of Australasia, Germany, Denmark, and Switzerland, is 815,947, female members not included. The American organization is not in affiliation with an English order entitled the Manchester Unity of Odd Fellows, who number 856,980. The Grand United Order of Odd Fellows of America (colored) numbers 150,339.

The Grand Lodges of Masons are in full affiliation with the English Grand Lodge, of which the Prince of Wales is Grand Master, and the Grand Lodges of Ireland, Scotland, Cuba, Peru, South Australia, New South Wales, Victoria, and Mexico, and also with the Masons of Germany and Austria. They are not in affiliation and do not correspond with the Masons of France. Freemasonry is under the ban of the Church in Spain, Italy, and other Catholic countries, and the membership is small and scattered. (See INSURANCE; TRADE UNIONISM, etc.)

FREELAND is the English name of a German book, *Freiland ein sociales Zukunftsbild*, written by the eminent Austrian economist and statesman, Dr. Th. Hertzka, advocating socialistic principles, and outlining an imaginary free socialistic state founded in Central Africa. It aroused very general attention, and committees were formed in various countries to raise money and establish such a State. Pioneers started to found the State, which eventually wholly failed.

FREE SOIL PARTY, THE.—This was the name of a political party that appeared in the United States about 1846 in the course of the abolitionist movement. (See ABOLITIONIST.) Its

standpoint was "the Wilmot proviso," offered by David Wilmot, of Pennsylvania, to amend a bill making an appropriation to negotiate peace with Mexico. It read: "There shall be neither slavery nor involuntary servitude in any territory on the continent of America which shall be hereafter acquired by or annexed to the United States by virtue of this appropriation or in any manner whatsoever, except for crime."

It created great excitement. Calhoun had declared that the annexation of Mexico was necessary to protect slavery, which was an institution placed under the guaranty of the Constitution and necessary to the peace and prosperity of the slave States. The proviso was defeated in the Senate, but taken up in the North. A convention met at Buffalo, August 9, 1848, and formed the Free Soil Party. It was composed of the old Liberty Party (*g.v.*), seceders from the Democrats and Whigs, and a faction of the Democrats called Barn-burners. Martin Van Buren and Charles Francis Adams, of Massachusetts, were nominated for President and Vice-President. The platform disavowed attacking slavery in the South, but simply stood for the above principle. The party polled over 300,000 votes and elected several congressmen, among them Charles Sumner, of Massachusetts, and Salmon P. Chase, of Ohio. The conflict then came over the admission of California, and when it was admitted with a constitution prohibiting slavery, the Free Soil Party lost its main need of existence. Agitation, however, sprung up over the Fugitive Slave Law (*g.v.*), and the Free Soilers met in 1852, and nominated John P. Hale, of New Hampshire, and George W. Julian, of Indiana, and polled 151,000 votes. But the aggressive policy of the South roused the North to a more general policy, and the Free Soil Party was merged, in 1856, in the Republican Party (*g.v.*). Its cry had been "Free soil, free speech, free labor, and free men."

FREE SILVER. See SILVER.

FREE TRADE.—Free trade is free exchange; and free exchange is exchange that is free. This looks like a mere truism; but if it is, it is one generally disregarded, and the words are used in an entirely different sense. Free trade is continually spoken of as a doctrine, a theory, or a principle. These uses of the term are permissible for the sake of brevity; but when it is never used in other ways the most important facts of the controversy are forgotten.

I. WHAT IS FREE TRADE?

No exchange is perfectly free; nothing is perfect in this world. But that exchange is most nearly free which encounters the fewest obstacles. It makes not the slightest difference whether these obstacles are natural or artificial; the only question is, how effective they are as an obstruction to exchange. No statute obstructs the freedom of exchange between Buffalo and Tennessee, while severe statutes obstruct exchange between Buffalo and Canada. Yet exchange between Buffalo and Toronto is, in every instance, much more free than it is between Buffalo and most of the mountain settle-

ments of Tennessee. A tariff of 100 per cent. does not obstruct trade half as effectually as a distance of 100 miles from any railroad or highway. Often it happens that prejudice and hatred make trade impossible where no law interposes any hindrance. Often, on the other

hand, strong and bitter prejudices are unable to hinder the growth of free trade between antagonistic sections. In determining the extent to which freedom of trade exists between any two districts, we must always take into account all the obstacles and inquire how far they are effectual. Tariffs are not the only obstruction or even the chief obstruction to free trade. They nullify, to some extent, natural facilities for exchange; but the gradual removal of natural obstacles also nullifies, to some extent, the operation of tariffs. The obstacles interposed by nature, in the first instance, are always far greater than any which can be interposed by human laws, because the latter are always more or less evaded, while the former never can be. The laws of nature originally prevented all exchange; then they prevented exchange between different tribes; they still make exchange difficult between different nations; and the greatest efforts of human skill and energy are directed simply to breaking down the barriers which nature has thus put up.

Free trade, however, by a figure of speech, stands for a political idea. That idea is that it is good for every man and every nation to exchange good things with each other; that every necessary obstruction upon such exchange is a misfortune; and that every unnecessary obstruction is a wrong. This idea implies that human governments ought not to hinder such exchange, or to regulate it in any other manner than as may be necessary for the prevention of dishonesty, oppression, and crime. This theory was adopted, so far as internal commerce is concerned, by the United States in 1789, since which time no State has been permitted to put the smallest obstruction in the way of commerce between its own citizens and the citizens of any other State, or to levy any taxes whatever upon imports or exports. The theory of absolute free trade demands that the same principle shall be applied to commerce between all parts of the world.

Free trade, as a political theory, in the more limited sense usually attached to it, means only that no taxes shall be imposed upon imports or exports

except such as are levied for purposes of public revenue only, and so arranged, in connection with other taxes, that no private profit shall be made out of their incidental results so far as it is in the power of legislation to prevent it. This

is what is often called British free trade, because it is the system adopted in Great Britain and Ireland, by gradual steps, beginning in 1846 and completed in 1860. It would, however, seem more accurate to call this the non-protective system. For a tariff may easily be devised of which the entire revenue would go into the public treasury, which would, nevertheless, be nearly as destructive of trade and commerce as a protective tariff. Thus, the Brit-

ish tax on tobacco, which is absolutely non-protective (because, in order to secure all the profit to the public treasury, no tobacco is allowed to be grown on British soil), is so exorbitant as to cut down trade in tobacco to half its natural dimensions; and it might easily be made so high as to destroy the legitimate trade entirely. Such extreme taxation would, of course, be inconsistent with the idea of revenue; but it may often happen that the largest amount of revenue could be obtained from a tariff which destroyed at least half the natural trade. It seems a contradiction in terms to call such a system one of free trade. Still, that is all which is meant by a vast majority of those who speak of free trade.

The system of "British free trade" is open to serious objection, as failing to prevent that private profit which it assumes to exclude. It is most skillfully planned to prevent domestic producers from collecting the equivalent of the tax upon foreign competing articles—for it taxes British productions of the same kind just as heavily as any foreign article is taxed. But the tariff, being necessarily confined to a very few articles, has to levy very heavy taxes upon these; and thus the wholesale trade in them is confined to persons who have capital sufficient to pay these taxes in cash. Every tax upon production or exchange, whether for revenue or not, thus fosters monopolies and seriously restricts the freedom of trade.

Complete free trade, therefore, is absolutely inconsistent with any form of indirect taxation. But the consideration of the relative merits of the systems of direct and indirect taxation must be deferred.

The right of property is of little utility and no value without the right of exchange. The very word "value" implies the idea of exchange; because, while there may be utility in the possession and use of an article, nothing can have **Essential to value**, in the proper meaning of **Civilization**, that term, except as measured by the possibility of exchange. Even the utility of property is very small without the right of exchange. Without exchange of products, each man must raise for himself every article which he desires; and the enormous labor and inconvenience of doing this would always keep man in the savage state. Indeed, there are few savages so degraded as all men would be if trade were entirely abolished. Every obstruction to the freedom of exchange of good things, therefore, is a step backward, not merely toward barbarism, but toward absolute savagery.

Every civilized man recognizes the enormous advantages of civilization. To be entirely deprived of them he would consider as a punishment only one degree less severe than death itself; and great numbers of men have at all times preferred death to such a fate. Yet free trade and civilization are so inextricably wrapped up in each other as to be almost identical. Upon the whole, freedom of exchange in goods and ideas is the cause and civilization the effect; yet every step forward in civilization instantly leads to a step forward in free exchange just as truly as every advance in free exchange causes an ad-

vance in civilization. There is no difference between civilization and barbarism except that which springs directly from the greater freedom of interchange in ideas and in goods, which civilized men enjoy. The height of civilization, in any community, large or small, is precisely measured by the extent to which it is able and willing to exchange its thoughts and its things with those of other communities. The passion for obstructing either form of such exchange is merely the reaction of partially civilized natures against civilization itself. Absolute independence, which is the avowed aim of obstructionists, would be the suicide of humanity. We are all—whether individuals, towns, States, or nations—intended to be dependent upon each other; and we all become more and more so with every succeeding year. The most highly developed man does as little as possible for himself and as much as possible for others. The most highly developed nation does very much the same. These tendencies are simply irresistible in all civilized communities; and against these gigantic natural forces all the puny efforts of bigots, whether in or out of legislatures, are in vain.

We now approach the line of division between the two schools of thought and the two great parties in political economy. And here we

The Protective System.

meet the second and limited definition of free trade. In the minds of most men free trade means substantially the opposite of the so-called "protective" system; and, therefore, a tariff for revenue only, without any element of protection in it, is generally supposed to be the equivalent of free trade, altho it is not. "Protection" is a system under which trade is intentionally obstructed for the purpose of preventing competition between different producers of similar goods. Its method of reaching this result is usually either by heavy taxes upon foreign products, or by absolute prohibition of certain classes of such products. Other methods, such as bounties, may, however, be used. In general, the protective system is supposed to be drawn exclusively upon national lines; and it is constantly assumed that the only question between protectionists and free traders is as to whether foreign goods should be admitted in free competition with domestic goods. But this was not originally so, and is not altogether so even now. It is true that, while all American protectionists are agreed in obstructing the importation of foreign goods into the United States, so far as they compete with similar goods produced within the United States, most of them do not desire to apply a similar rule between the several States of the American Union, much more between different sections of the same State. Yet a vast number of them hold a different opinion, and would put up barriers between the different States, and sometimes even between different counties if they could. Constant efforts are, indeed, made in this direction. The Legislature of New York has passed laws requiring all stone used for public buildings to be dressed and finished within the State; and serious efforts have been made to compel such stone to be taken from New York quarries.

The common councils of some cities have repeatedly made efforts to prevent the admission into those cities (for public use, at all events) of certain classes of goods made in other cities. Heavy license fees have been repeatedly demanded by the authorities of one State from citizens of other States undertaking to sell goods within its borders. Many statutes and ordinances of this kind have been enacted, most of which, however, have been held void by the Supreme Court of the United States as violative of the Federal Constitution. If it had not been for the existence of that Constitution and the firmness of the Supreme Court there can be little doubt that long before this time such laws and ordinances would have been universal, because they would have been enacted in retaliation, even in States where the people disapproved of them as an original proposition. The principle underlying such statutes and ordinances is precisely the same as that which underlies any protective tariff whatever. No intelligible distinction can be made between the two cases. No sound reason can be given for maintaining a protective tariff between New York and Canada, which does not apply with a hundredfold force to New York and New Jersey. This will become plain as we consider the arguments usually made in favor of protection.

II. OBJECTIONS TO FREE TRADE.

The principal American arguments against free trade seem to be: That we ought to be independent of foreign countries; that imports of merchandise ought to be forcibly kept below exports, so as to secure a "favorable balance of trade," which will "keep our money in our own country" and prevent the export of gold—which is assumed to be a great injury; that everything which we import which we could make ourselves necessarily displaces just "so much American labor," and deprives Americans of that amount of employment and wages, without compensation; that the admission of goods made by "the pauper labor of Europe" inevitably tends to reduce American wages to the European level; that a tax ought to be imposed upon foreign goods "sufficient to equalize the difference between foreign and American rates of wages;" that "our" home market belongs to "us," and foreigners ought not to be allowed to "invade" it without paying toll; that "diversified industries" are essential to national prosperity, and can only be acquired by "encouraging" new industries through protection against foreign competition; that every new industry is a distinct addition to the national wealth, which can only be secured by protection; that free trade would *reduce* prices, and, therefore, reduce wages; that free trade would *increase* prices by giving to foreigners the monopoly of our market, while protection reduces prices by increasing domestic competition; that under free trade, foreigners would "flood our markets" with their goods, furnishing everything so cheaply that we could make nothing for ourselves; that under free trade foreigners could not supply us with one tenth of the articles which we need, while we could not make any ourselves, and should therefore have to go with-

out the necessaries of life outside of agricultural products (Governor Hoyt); that the tariff is not a tax; that the tariff is a tax upon foreigners; that a revenue tariff is a tax upon Americans, while a protective tariff is a tax only upon foreigners (Major McKinley); that "cheaper coats involve a cheaper man and woman under the coats" (General Harrison); that "cheap and nasty go together" (Major McKinley); that "the vulture loves not his carrion more than the free trader loves cheapness" (H. C. Baird); that "cheap merchandise means cheap men, and cheap men make a cheap country, and that is not the kind which our fathers builded," nor one "which their sons mean to maintain" (Major McKinley); that coats and all other things have been made cheaper by high protective tariffs than they ever were before (Harrison, McKinley, Aldrich, etc.); that goods cannot be made cheap unless wages are made low; and that protection makes goods cheap and wages high. Many other arguments are or have been in common use; but those here cited are the most familiar at present. We are not responsible for their contradictions of each other. No argument is given here which has not been repeatedly used by distinguished champions of the protective policy, and printed in publications issued by one or more of the three most active protectionist organizations. The most contradictory utterances sometimes proceed from the same mouth; and the more distinguished and sincere the orator is the more certain is he thus to contradict himself.

The protective idea is by no means peculiar to America. It was dominant over the whole world until within the last 50 years, with the exception of a few cities, like the Hanseatic League; and it has never been entirely shaken off by any nations except the British, Dutch, and Belgians, while it seems to be regaining its hold upon Belgium. Holland introduced comparative freedom of trade in advance of Great Britain, but only in a partial and inconsistent manner, jealously excluding foreigners from her colonial trade. China and Japan, as is well known, maintained an ideal system of protection for many centuries—not by any tariff, but by the absolute exclusion of imports.* Naturally, it will be found that the arguments in favor of the system are irreconcilably conflicting in different countries. In the United States, the one argument, which overshadows all others, is the danger of competition with countries having lower rates of wages. But in all continental Europe producers are frantic with anxiety to exclude the competition of countries having higher rates of wages; and in Russia, where wages are lowest, the tariff is highest. Even in the United States the highest rates of protection are always placed upon the productions of those countries where wages approach most nearly to the American standard.

III. REVIEW OF OBJECTIONS.

1. *We should be independent of foreign countries.* This is a favorite argument with many protectionists. But the only persons who

are independent of others are savages of the lowest type. The only nations which are independent of others are barbarous or half civilized. China presents the highest type of an independent nation; and China, many centuries ago, shutting itself in from the rest of the world, and assuming a position of commercial and industrial independence, stopped all growth except in mere numbers, and all improvement, moral, intellectual, and material.* Such independence is utterly inconsistent with civilization. Every step toward the one is a step away from the other. Fortunately, such independence is impossible for us. The instinct of intelligent humanity toward mutual dependence and the exchange of ideas and products is so strong that no laws and no absurd prejudices can stand in the way. Commerce goes on and will go on in spite of tariffs or even prohibitions. The instinct is a perfectly sound one. The richest and strongest men are the most dependent upon others. All the value of wealth consists in the power which it gives to its possessor to command the services of other men. All the glory of a great military chieftain consists in the vast number of brave men, upon whom he is absolutely dependent, and whom he has inspired with a just confidence in their mutual dependence upon him. And nations are rich and strong in exact proportion to the degree in which they have established relations of mutual dependence between themselves and other nations.

Foreign Countries.

2. *The balance of trade.* The idea that the balance of trade is favorable to our country, when we export continually goods to a greater value than we import, is almost universal, yet clearly erroneous. Imports are what we *get*; exports are what we *give*. It is impossible that we should gain a profit by forever giving more value than we receive in exchange. Prosperity comes from steadily importing things which are of greater value to us than those which we export. All figures as to the balance of trade, moreover, are delusive. No two countries make up their trade statements upon precisely the same principle. Great Britain computes the value of her imports upon British prices. America computes hers upon foreign prices. The difference is fully 10 to 15 per cent.; because the one includes freight, insurance, landing charges and profits, while the other does not. Again, our exports are worth much more to foreign recipients than they are to us, while our imports are worth much more to us than they are to foreign shippers. Happily for us, commerce regulates these matters for itself, and we actually import every year much more in value to us than we export. Every country not plundered by foreigners or non-resident landlords does the same.

3. *The drain of gold.* The "balance of trade" delusion rests, however, upon another delusion, as to the existence and effect of a "drain of gold." It is supposed that the con-

* The example of China is frequently referred to by leading American protectionists as one to be followed in this respect.

* The example of China in this respect also has been often referred to by American protectionists as one to be followed by us. H. C. Carey uniformly declared himself in favor of "a wall of fire across the Atlantic," and protectionist candidates for Congress have placarded their desire for "a Chinese wall."

stant flow of gold from America is a great evil, and that this evil could be stopped by importing fewer foreign goods, exporting more of our own, and collecting the balance in gold, or, at all events, keeping all our own gold at home. On the contrary, nothing whatever can keep our gold at home; and if it could be done it would be a national disaster. Our country produces more gold than any other, and more gold and silver than all the rest of the world.* We have no use for seven eighths of the gold which we produce. If we could keep it all at home we should simply pile it up in vaults, as we have done with silver for fifteen years. But the owners of gold mines could always get more goods for their gold than we would give, and therefore they would send the gold abroad, no matter what tariff we had. Indeed, the higher the tariff the less does gold bring at home; and, therefore, every advance in the tariff tends to increase the export of gold. The official statistics show that such has been the result † More gold has been exported, on the average, annually under high tariffs than under low tariffs. At all times we export all the gold which other countries are willing to pay for; and if we increased our imports of merchandise to any conceivable amount, we should not increase our exports of gold. We do not produce enough gold to pay for one twentieth of our present imports; and, therefore, if we doubled our imports there could be no further "drain of gold."

4. *Displacement of American labor.* No amount of foreign productions can displace American labor. Every ounce of foreign goods must be paid for in American goods, produced from American materials, on American soil, by American labor. For every dollar's worth of imported goods a dollar's

Labor.

worth of American-made goods must be exported. Therefore precisely as much employment is given to American labor by the purchase of imported goods as by the purchase of home-made goods. But, it is said, "the foreigner will demand payment in gold or silver." Let him "demand" what he pleases, he cannot get either to the value of more than one tenth of what he sends to us, for the conclusive reason that we produce no more. And to that extent gold and silver are our natural productions, which we are fully as anxious to sell as we are our surplus wheat or pork. Indeed, after abusing "the foreigner" for 50 years, because he would buy our silver at higher prices than we were willing to give for it, we now abuse him because he will not buy it fast enough; and it is solemnly proposed in Massachusetts to cut off trade with England unless she will agree to buy silver instead of wheat.

5. *The pauper labor of Europe.* If there is any such thing as the imported product of "pauper labor" (which is a contradiction in terms, since paupers necessarily do not produce enough by their labor to support themselves, much less to send abroad), the only effect of its

exclusion must be to put a premium upon the importation of the paupers themselves, bringing their labor into direct competition with American labor and reducing American wages. For paupers are, as a matter of course, at the lowest point at which life can be sustained. If they are dependent for even this subsistence upon the American market for their productions, and they are shut out of that market by an increase of the tariff, they must and will carry their hands to that market. For many years it was the avowed purpose of protectionists to produce this result; and Henry C. Carey pointed to the increase of immigration as a proof of the beneficent effects of protection; while in 1864 a strongly protectionist Congress enacted a law giving to the importers of pauper laborers a lien upon their earnings and land, for the cost of such importation, and enforcing contracts for service made abroad at less than American prices. This law was not repealed until 1884, after immense numbers of laborers had been imported under such contracts.

6. *Duties to equalize wages.* This is the most plausible protectionist argument. But in fact, nine tenths at least of American workmen receive less wages, in proportion to the value of their production, than do workmen in any other part of the world. They receive a larger sum *per day*, but a much smaller sum *per piece*. All over the world high wages mean, as a rule, cheap labor. American wages are the highest, and, therefore, American labor is the most productive and the cheapest. In a very few lines of production it may be true that American labor costs more per piece than does foreign labor. A "duty to equalize the difference in wages," in such cases, means that the whole mass of American laborers are taxed to repay, to the employers of a very few, this difference in cost. The workmen thus employed are not benefited, because they could earn just as good wages at some different work; and if the goods which they now make were imported, they would be employed in making some other article to be exported in payment for those goods at the same or better wages. The whole benefit of such a tax goes into the pockets of the protected employers. Moreover, such "compensating duties" are never confined to the limits of compensation; they are always made so high as to exceed the whole wages paid. Thus, the protective duties levied upon coal and iron ore have been for many years 75 cents per ton, while the whole amount of wages paid for the production of either has been always less than 50 cents, and often less than 25 cents per ton. The protective duty on steel rails, down to 1894, was never less than \$13.44 per ton, and was for many years \$28; while the excess of labor cost in America over that of Europe has not, for many years, amounted to \$3 per ton, and for the last five years has not exceeded 50 cents. The labor cost in steel rails is now less in America than in any part of Europe. Heavy duties are imposed upon cotton goods of all kinds, altho it has been conclusively proved that the labor cost in most of such goods is much less in America than in any part of Europe, or, indeed, the world, and has been so for more than 15 years. A "protective duty" of 60 per cent. is maintained

* In 1890 the production of gold was: United States, \$32,845,000; Australasia, \$30,416,500; Russia, \$21,161,700.

† Average annual export of gold and silver, from 1847 to 1861, under low tariffs, \$25,986,002. Annual average for next 30 years, under high tariffs, \$29,853,698.

“solely to enable American employers to pay to their workmen” less wages than are paid in Europe for the same work.*

7. *Diversifying industries.* Professor R. E. Thompson declares that the fundamental idea

* The evidence of this in detail would occupy too much space. It is given, with regard to the cotton manufacture, in official reports of the State Department—one made by Secretary Evarts in 1879, and the other by Secretary Blaine in 1881. Both state explicitly, as a result of all the investigations made by the United States consuls abroad, that the higher wages of American workmen are more than compensated for by the still greater excess in their production. The same fact was shown in a report made by Mr. James Thornly in 1879, in which he gave in detail the precise cost of labor in a yard of cloth, in New England and in Lancashire, in various mills. In every instance the labor cost in New England was 20 or 30 per cent. less than in Old England. His tables are given in Mr. Blaine's report of 1881. This result is confirmed by the census of 1880, which showed that while each English cotton worker only used 2660 lbs. of cotton, each American worker used 4290 lbs., or 61 per cent. more. In weaving, the very same operators who in England attend to not more than three looms each attend in America to at least five and often more. So in other manufactures. In 1880, the average production of each metal-worker in the United States was valued by his employers at \$1684, while that of each British metal-worker was valued at only \$780. In 1886, the coal-mine owners of Maryland, etc., testified before Congress that the wages paid for each ton of coal did not exceed 40 cents (*Testimony Ways and Means Committee*, pp. 187, 191, 193); while in England 96 cents were paid, and in Scotland \$1.00 (*British Statistical Abstract*). An American machine, widely used in shoemaking, which registers the amount of work done, shows that the production of each English shoemaker is upon the average only $\frac{1}{2}$ per cent. of an American's production; that is less than one half. But evidences need not be multiplied. The fact is fully admitted by the best protectionist authorities—e.g., Professor Thompson (*Political Economy*, § 126), the Protective Tariff League (*Tariff Committee Report*, 1882), and Robert P. Porter (*New York Press*, October 3 and 14, 1888).

It is the result of a universal law. The United States census of 1880 showed that high wages everywhere resulted in such increased production as to make them more profitable to employers than low wages. Thus, to give only a few examples out of thousands, the aggregate average rate of wages and net production of each wage-earner were as follows:

IN ALL INDUSTRIES.

	Wages.	Production.
New York City.....	\$427	\$811
Philadelphia.....	346	675
Baltimore.....	268	576

IN COTTON GOODS.

	Wages.	Production.
Massachusetts.....	\$258	\$593
New York.....	216	392
Georgia.....	182	396

IN WOOLEN GOODS.

	Wages.	Production.
Massachusetts.....	\$316	\$737
New York.....	289	597
Ohio.....	194	449

of the protective system is to divert industry, by artificial means, into channels through which it would not otherwise flow. This is undoubtedly a correct statement of the philosophy of protection, as held by all its intelligent and disinterested advocates. It is usually expressed as the “diversification of industries;” and it is earnestly insisted that a multitude of different new industries are so necessary to the prosperity of every nation that they must be forced into existence by taxing all the old industries for their support. But diversity of industries is neither a **Diversified** cause nor a condition of prosperity. **Industries.**

The mass of the people in California and Australia were never so prosperous as when they had practically only one industry—the digging of gold. Their industries diversified fast enough when no more gold could be scraped up by hand, because they no longer had the means of paying other people to supply them with other articles. Nothing ever induces men to diversify their industries except the pressure of comparative poverty, caused usually by the decreasing returns from those industries in which they were previously engaged. So far as a protective tariff really does diversify industries, it must do so by impoverishing the people, because it can be done in no other way. This would be true even of a bounty paid to those entering upon a new industry, because, while it might make them rich, it must be taken out of the pockets of the people at large, making them poorer by the amount of the bounty and the expense of its collection and distribution. A protective tariff does not have even the questionable merit of a direct bounty. It gives nothing, confers no benefits, creates no industry. All that it does or ever can do is to *kill* some existing industry, to ruin some persons who are earning an honest living by providing useful things for their fellow-men—to destroy, never to build up. Its work is purely destructive. It develops nothing. After a new tariff tax has destroyed one or more domestic industries by preventing the importation of the materials which are essential to them, those who are thus deprived of their usual employment and income look round for some work which the tariff has *not* destroyed; and thus production in that particular line is increased. For example, before 1883 the duty upon both ruffings and the materials out of which they were made was 30 per cent. Somebody thought he could make the materials in America, altho they were then all imported, so he persuaded Congress to put a duty of about 125 per cent. on them, leaving the duty on the finished manufacture unchanged. The result was that the manufacture of ruffling here was totally destroyed, and thousands of work-people discharged. They could not get employment in making the materials, for they did not know how to do it. Nobody in America succeeded in making them. So ruffings were imported instead of the materials for ruffings. In other cases Americans do succeed in making the materials after being “protected” out of the manufacture of the finished article; and then it is proclaimed that the tariff has “created a new industry,” when all that it has done has been

to kill an old one. A new industry is not necessarily any addition to national wealth; and certainly a new industry "created" only by the destruction of an old one, which was more profitable to the community (as must needs be the case where a heavy tax is required to induce men to abandon it for the new), is a positive national loss.

8. *The "flood of foreign goods."* On this point, two entirely contradictory arguments are used by protectionist authorities of equal standing. The most common assertion is that if the protective barrier were removed, foreigners would "flood our markets" with manufactures, if not with other things, so that our own manufactures would be entirely destroyed; all our wants in that line being supplied by foreign producers. But as statistics prove that if all European countries sent to America the whole of their surplus products they could not supply us with one tenth of the manufactures which we annually consume, it is manifest that there could be no such "flood." No one has pointed this out more clearly than Alexander Hamilton did a century ago; and it is even more true now than it was then. Accordingly, Governor Hoyt, of Pennsylvania (in his book, which is one of the standard works circulated by the Tariff League), insists upon this fact, drawing from it the extraordinary inference that we could not manufacture anything ourselves, on account of the low prices of European goods, and yet that the supply of such goods would be so small that nine tenths of our people "would have to go without" clothing, tools, machinery, and all other manufactures. The gigantic absurdity of such an idea ought to be so plain as to need no argument. Obviously, before any such result could occur, the prices of European and American manufactures would be equalized; and if Americans refused to produce on those terms, European prices would advance, by reason of American demand, to a point which would induce American production upon as large a scale as ever. With cheaper prices American consumption would increase so enormously as to absorb all that Europe could possibly send, in addition to a larger American production than there is now. The largest output of American manufactures has always occurred in the years of the largest importation of foreign manufactures; and so it always will be. Senator Mills has demonstrated this to be the fact by official statistics.

9. *The tariff not a tax.* So many absurd and contradictory statements are made under this head, that it is almost impossible to hold a protectionist down to any of them. As soon as one of them is refuted he will say that he does not hold to that, but does hold something else. Not having an acre of space, we must deal with only one of these assertions, which Mr. McKinley delights in. This is, that a revenue tariff is a tax upon our own people, while a protective tariff is a tax upon foreigners. Thus, the duty upon *raw*

sugar, being a revenue duty, is declared by Messrs. McKinley, Aldrich, and Reed to have been a tax on Americans of \$70,000,000 a year. But the duty of half a cent a pound upon *re-*

finéd sugar, under which the Sugar Refining Company has secured a profit of over \$15,000,000 a year, is purely protective, and therefore must be paid by foreigners. How did they pay it? Not as much as \$10,000 is paid by anybody, foreigners or Americans, as duty upon refined sugar in any year. American sugar eaters paid the \$15,000,000 we know, for over \$10,000,000 were paid out in dividends, and the company avowedly retained \$5,000,000 more on hand. Did foreigners kindly remit this vast sum in order to fulfil Mr. McKinley's doctrine? If so, who got the money? Did the sugar refiners or the sugar eaters?

It must be quite clear that foreigners do not pay the tariff tax when no tax is collected. But the case of Sumatra tobacco has been mentioned, even by some free traders, as one in which the foreigner paid at least part of the tax. Yet there is no case in which the facts more clearly demonstrate the contrary. The duty on this tobacco was suddenly raised in 1890 from 75 cents a pound to \$2, an increase of \$1.25. Millions of pounds were imported under the new duty. The foreign price, in 1889, under the old duty, was 84 cents. How *could* the foreigner pay the increased duty of \$1.25 out of 84 cents? Nor was the foreign price reduced. It advanced to 95 cents in 1893 and 1894, in spite of the new tariff. Every cent of this tariff tax was paid by American consumers.

Tin plates are often cited on this point. Quotations are given, showing that the price in Wales was reduced, after the increase of the tariff, by about the amount of such increase. The fact is, that nine months' notice of the advance having been given, the American demand was so intense that the Welsh mills were kept at work during that period night and day, and of course Welsh prices were advanced. After the new tariff took effect (July 1, 1891) the American demand fell off at once, having been supplied for a long time in advance. Welsh prices then fell back to their original point. Importations being eventually resumed in 1892, Americans paid the old and regular prices, with the duty added. Foreigners did not pay the tax at all.

The whole foundation for the pretence that foreigners ever pay any part of our tariff taxes rests upon the undoubted fact that by preventing ourselves from buying the things which we want we can inflict some injury upon those who would be glad to sell them to us. We can do precisely the same thing by all getting drunk three times a week, or by setting fire to our houses once a year. Any injury which we inflict upon ourselves produces some loss to our neighbors by preventing us from doing the good to them which we should otherwise do. All civilized people are compelled, by the fundamental conditions of civilization, to divide their profits with each other; and therefore they divide their losses with each other also. A protective tariff inflicts vast loss upon the people who adopt it; and they have, therefore, just so much less to share with the rest of the world. To that extent alone they can injure other people by it. It is the same in its effects as a hundred great city fires, a partial failure of crops or a general pestilence. Any country enjoying these bless-

The
Tariff
& Tax.

ings can safely assure itself that their effects are deeply felt in other lands.

IV. REAL CAUSE OF THE SURVIVAL OF THE PROTECTIONIST IDEA.

The arguments for protection are so inconsistent, so mutually destructive, and so utterly without real foundation that no one who undertakes to defend it ever conducts discussion to a logical conclusion, and every argument on that side speedily lands in a mass of absurdities. Accordingly, the advocates of protection almost invariably concede, when they enter into discussion at all, that free trade is correct in theory, but will not work in practice. They insist that experience proves that protection is productive of the best results in fact, altho they admit that logic and abstract reason are opposed to it. Of course, nothing can really be sound in theory which will not work in practice. But the mass of men are unable to justify any large part of their practice by theories; and therefore the faith of protectionists is not shaken by their inability to find reasons for it. Yet the widespread popularity of the protective idea indicates that there are motives lying behind the common arguments which are stronger than any of the arguments put forward; and it is necessary to search below all the pretended reasons assigned to find the real foundations of protectionism.

As the motives which give force to the protective idea are conflicting, it is expedient to consider them with reference to the several classes which have different interests, but which agree in supporting a policy of obstruction and exclusion. These classes are, substantially, the landowners, the employers of productive labor, and their employees. Each of these classes has an interest distinct from and in some respects hostile to the others; yet in the Northern States of the American Union a majority of each have generally favored restrictions upon the influx of wealth from abroad.

1. Landowners as a class are not predisposed to a protective policy in any country which has nothing to expect in the way of foreign competition with agricultural products, because a large majority of them are always owners of agricultural lands. Accordingly, Adam Smith noticed, in 1775, that English landlords were comparatively liberal in their views; and altho they had entire control of the British Parliament, which maintained a most stringent prohibitory system, this was entirely due to the clamorous demands of merchants and manufacturers. At that time England exported grain almost as often as she imported it. But within 40 years afterward the food supply of Great Britain fell permanently below the needs of its population; and from that moment British landlords in general became the most fanatical of protectionists, while, as British manufactures extended so rapidly that the foreign market became indispensable to them, manufacturers gradually became free traders. So in the Southern States of our Union, after cotton became their staple product the landowners had nothing to gain by excluding foreign goods; and so they became generally free traders. A majority of the owners of

farms all over the United States, outside of a few special districts, were anti-protectionists before the Civil War, and so continued until a very recent period. But owners of mines, quarries, and similar lands are naturally inclined to exclude not only similar foreign products, but also all articles manufactured from those products; their instinct telling them that the rent of their mines will be reduced as much by the admission of the finished products as by the admission of the raw materials. And when any country begins to import food upon a large scale, the same instinct tells landowners generally, outside of cities, that their rents are brought into competition with rents elsewhere, and they speedily become protectionists. In the long run, landlords are the only class which profits by protection. Such profits as tenant-farmers make out of it are almost instantly swallowed up by increased rents; while the profits of manufacturers are, considered as an entire class, gradually absorbed by rents and royalties, which are the same thing.

2. Employers of labor in lines of production which are open to foreign competition have a direct interest in the exclusion of such competition, which naturally makes them the earliest and most ardent protectionists. The whole profit of the system accrues to them, in the first instance; they know that they do not share it with their employees; and they do not readily see how much of it is extracted from them by landlords. Indeed, the first profits which accrue by a sudden increase of protective duties do remain entirely with employers; since their rents and royalties are usually fixed for a term of years, and their workmen are content with the old rate of wages, because so many are thrown out of work by the change in the tariff that the others are thankful to continue as they are. This accounts, in part, for the endless demands of American manufacturers for higher and still higher duties. No matter what bonus may be given to them in the form of taxes upon their competitors, the landowner takes it from them in the course of three or four years, either by a direct increase of rent or by a higher price of raw materials. Meanwhile, foreign rents are depressed, foreign ingenuity is stimulated by necessity, competition creeps in in some new form, profits fall to the average standard, and new clamors arise for further protection.

3. There remains that vast majority in every country who are employed by others, and who depend for their living upon "obtaining work." These are possessed of neither land nor capital sufficient to produce a living therefrom by their own labor. It is correctly pointed out by Henry George that such men naturally come to look upon work itself as a blessing, and upon the man who "gives employment" of any kind as a benefactor. And as a protective tariff undoubtedly increases the amount of work to be done, by diverting industry from channels in which large results are obtained by small effort into those in which small results are obtained by great effort, the mass of mankind overlook the fact that wealth is diminished because they see that labor has been increased. It is in vain that a protective tariff is proved to produce the same effects as a Chicago fire or a civil war. So

long as their own houses are not burned down nor their own families destroyed by war, the mass of men instinctively think of fire and war as new openings for employment and consequent wages. This habit of thought extends through all classes, in sympathy with the majority. The late Mr. Blaine constantly referred to the Mexican War of 1846, the European civil wars of 1848, and the Crimean War of 1854 as direct and potent causes of American prosperity, under and in spite of the low tariff of 1846; and his sentiments were unanimously echoed by all protectionists in perfect sincerity. The belief that the great Civil War of 1861-65 was the cause of great prosperity to the Northern States is very general, both at the North and at the South.* Men of the highest intelligence and business capacity in Europe are to-day terrified by the fear of low wages and calamity to the laboring classes as the result of any general disarmament. For, as one of the ablest of them said to the writer, "when 3,000,000 men are suddenly disbanded, to compete for employment with the millions already struggling for a bare living, God alone knows what will become of them all!" It never occurs to such reasoners that the 3,000,000 idle soldiers are now supported out of the earnings of the other millions. All which they can see, and all which the laborers themselves are apt to see, is that there are now 3,000,000 fewer "competitors for employment" than there would be if the soldiers began to earn their own living. Thus the great evil of land monopoly adds to all its other baneful influences the training of the masses into false

* All these ideas are mere delusions. War may, indeed, be necessary for the purpose of avoiding greater evils, but it never of itself brings any benefit either to the nations engaged in it or to neutral nations. The only apparent exception to this rule is when war takes place between two countries, one or both of which has refused to trade freely with other nations, and the war drives large numbers of the most ingenious and industrious people out of one of these countries into some neutral country, to which they transplant their wealth and industry. But the whole of that benefit would have been obtained through peace and free trade, while the people thus driven out are much poorer than they would have been had they remained at home, and are therefore less able to confer benefits upon the country of their adoption. In every other case, war, no matter how much it may increase the trade of neutral countries in particular lines, always reduces their trade and profits, considered as an entirety. Thus the Crimean War of 1854 and 1855, while it increased the European demand for American grain and provisions, reduced the demand for American cotton to at least as great an extent and injured American trade in many other ways. Accordingly, it is an indisputable fact, proven by all the statistics and by the testimony of protectionists themselves, that the two years of the Crimean War, from March, 1854, to March, 1856, were years of comparatively hard times in America, and certainly the worst years known under the tariff of 1846.

The European insurrections of 1848 and 1849 also marked a period of depression in American trade and manufactures. These are not mere coincidences; foreign wars always have produced and always will produce depression in this as well as every other civilized country.

As to the supposed prosperity derived from the Civil War of 1861, it is well known by every one who was in business during that period that the first two years of that war were years of hard times, low wages, and forced economy in business generally; while the apparent prosperity of the last two years was nothing but the intoxication arising out of a forced expansion of the currency, which drove everybody into speculation, the reaction from which soon brought about the hard times of 1867 and the following year.

views of their own situation, and it incites them to seek for relief in methods which enormously aggravate the evils under which they suffer.

4. We have already begun to tread upon ground which is common to all classes, but much remains to be said. As already indicated, the exclusion of foreign goods secures, for at least a short time, large profits to a small class of employers who are necessarily capitalists or close associates of capitalists from the first, who easily combine and who exercise almost irresistible control over the organs of public opinion and over legislation. They own newspapers, congressmen, political parties, and even churches. The benefits conferred upon this small class are obvious to everybody; the increase in their wealth appears to be an increase in the wealth of the nation and a proof of general prosperity; while the injuries caused by the system are widely diffused and are felt mainly by those who are not able to make themselves heard. The superstitious reverence for money, as by far the most important form of wealth, has a tremendous hold upon all classes, and makes them fearful that their country will be ruined by the outflow of gold in exchange for goods. The old idea, that whatever one man gains some other man must lose, has also still a strong hold upon the popular mind. But, more than all besides, except, perhaps, the idea about "giving work," already mentioned, the protective system derives its vitality from that instinctive hatred of strangers which, inherited from prehistoric times, still maintains its hold upon human nature, notwithstanding all the veneration of religion and civilization. The ancients used only one word to express the ideas of both "foreigner" and "enemy." Altho we use separate words, we have only partially separated the ideas. International enmities are never quite extinct, and they are easily kindled into a flame. The desire to injure those whom we intensely hate is far stronger among us all than any desire of profit for ourselves. Hatred of the Dutch was the supreme motive of the original English navigation laws. Hatred of the French was the sole motive of the enormous differential duties laid upon French products by England down to the time of Adam Smith, and of much subsequent British tariff legislation. Hatred of England was the sole motive of Napoleon's prohibitory system. Hatred of England inspires and accounts for two thirds of American tariff legislation. And hatred of Canada, aroused by the malignant feelings against us showed by Canadians during our Civil War, especially at the time of the raid on St. Alban's, was practically the only cause of our abrogation of the reciprocity treaty in 1866.

V. PRACTICAL RESULTS OF FREE TRADE IN AMERICA.

Protectionists often concede that free trade is correct in theory, while insisting that "it will not work in practice." They "take their stand upon the facts," which, they honestly believe, contradict the theory. Of course, it is absurd to say that any theory can be correct which does not fit the facts; but no matter. The truth is that the facts all confirm the theory. Free

trade means simply the removal of obstacles to trade ; and freedom of trade is increased whenever more obstacles are removed than are raised up. Now, while it is true that, since 1861, obstacles to trade in the form of tariffs have been increased in the United States, and true, also, that such obstacles have been increased all over Europe (except in Great Britain and Ireland, Belgium and Holland), since 1879, it is not at all true that there are, upon the whole, more obstacles of all kinds or more in aggregate effect in either America or Europe. It cannot be denied that the vastly larger share of the increased prosperity which has come to the United States in the increase

of population, of manufactures and of generally diffused wealth (leaving out of consideration the enormous wealth of multi-millionaires) has gone to the section *west* of the Alleghany Mountains. That section has almost monopolized the manufacture of iron and steel, as well as of most heavy and cumbersome goods. In 1860 more than three fourths of all these things were produced *east* of the Alleghanies. In 1894 more than three fourths of the same goods are produced *west* of the Alleghanies. Even as early as 1880 two thirds of the iron and steel were produced there. It is probable that seven eighths are produced there now. The production of iron and steel in New England has been killed ; in New York it has been stunted ; in New Jersey and Eastern Pennsylvania it has been almost paralyzed. Why is it that the West has thus outstripped the East in the manufacture of articles in which the East had, prior to 1860, such great superiority ? It is not due to lower wages, for wages were very much higher in the West. It is not due to cheap capital, for rates of interest were much higher in the West. It is not due to superior experience, for the East had the experience and the West had not. Finally, it is not due to "protection," for the West was utterly unprotected against the competition of the experience, the cheaper capital, and the cheaper labor of the East ; and the reduction in railway freight charges has been so immense as to much more than nullify all the "protection" against Europe granted by the new tariffs. For example, the increased protection on pig iron has been little, if any, more than \$4 per ton ; while the reduction in freight rates between Liverpool and Chicago has been fully \$12 per ton. For the last 20 years the actual obstacles to the importation of foreign pig iron into all the region west of the Alleghanies have been less, not more, than they were under "the free trade tariff of 1857," and just as fast as these obstacles were removed, so fast did the production of pig iron in that region increase. On the other hand, the obstacles to the admission of foreign iron into New England and New York have been increased, the decline in ocean freights not materially counteracting the increase in the tariff ; and the iron manufacture in those States is practically dead. This is a conclusive demonstration, from actual experience, that increased freedom of trade promotes manufactures in new countries, and that those countries in which wages are highest and money dearest can compete successfully with older

countries in which wages are low and money cheap. Indeed, the entire history of the United States is one continuous illustration of the immense benefits of free trade. Our country is larger than the whole of Europe—Russia, perhaps, excepted ; it is as varied in the character of its population and more varied in its climate and soil ; in short, there are no reasons for protective tariffs between the nations of Europe which do not apply with even greater force to the different sections of the United States, except that the United States are confederated and the European States are not ; which is really no reason at all. The absolute freedom of trade which exists throughout our own country is the principal cause (so far as any governmental influences are concerned) of our wonderful national prosperity. Its beneficial effects have been so great as to more than counterbalance the injuries inflicted upon us by stupid legislation and by the prejudices, follies, and extravagance of our people. It was the instinctive sense of this fact which aroused the tremendous energy and determination of the Northwestern States during our Civil War. Their great object was, avowedly, to maintain the freedom of the Mississippi ; which was, obviously, only another form of expressing the absolute freedom of trade between all sections of the Union.

VI. PRACTICAL RESULTS OF FREE TRADE IN EUROPE.

It is continually assumed by American protectionists, in discussing the question of relative wages, that the low wages of Europe are due to free trade. Yet, when they discuss any other branch of the subject, they eagerly assert that Great Britain is the only country in the world in which free trade exists. The fact is, that nearly every nation on the continent of Europe maintains a tariff for protection as well as for revenue. As nearly as it is practicable to classify them, their tariffs stand in the following order of stringent protectiveness : Russia, Spain and Portugal, Italy, France, Austria, Germany, with the smaller countries following under lower tariffs, with little intentional protection, but a good deal incidentally, except in Holland and Belgium, where incidental protection is very slight. Wages are at the lowest point in Russia, a little higher in Spain, Portugal, and Italy, considerably higher in France, Austria, and Germany, and far higher in Great Britain. It is clear that protection does not help wages anywhere in Europe. Still, much as the wages of France and Germany are below those of free trade England, it is certain that they are higher than they were 40 years ago. The manufactures, trade, and commerce of all Central Europe are much greater than they were at that time. The wealth of all Central Europe has greatly increased and is constantly increasing. Have these results come from increased restrictions on trade or from the removal of such restrictions ? American protectionists point to the existing tariffs of Europe as an evidence that European prosperity is at least not hindered by protection, if not caused by it. Now, it is not disputed that substantially all of the improvement in the condition of the people

Europe.

of Europe, such as it is, has come about within the last 40 years, and most of it since 1860. But highly restrictive as most European tariffs undoubtedly are to-day, not one of them (Russia, perhaps, excepted) is as restrictive as it was 40 years ago. Between 1850 and 1860 there was a general reduction of tariffs. Germany, in particular, repealed most merely protective duties in 1867. France had comparatively moderate duties, under the Cobden treaty, from 1860-77. The advance of both Germany and France under this *régime* of greatly reduced protection was vastly more rapid than it had ever been before. Other European countries also prospered more than ever where they reduced or abandoned the protective policy. Never, in all their history, had there been any such advance in wages or in general wealth; and this, too, in spite of the enormous losses caused by the terrific wars of 1866 and 1870. But when the world-wide depression of 1875 set in, many of the people, forgetting all that they had suffered under the high protective *régime*, imputed their new troubles to the abandonment of that policy; and their rulers, eagerly desirous of more revenue, easily persuaded them to consent to higher duties. The improvement—also world-wide—of 1879-81 confirmed the popular impression that protection was a benefit; and all Central Europe entered into a war of tariffs and of trade obstruction. The results have been disastrous to all parties. Italy has been ruined; France has been stunted; and in Germany, the growth of discontent, turning to revolutionary socialism for relief, has been most portentous. Nearly all the improvement in wages and in general prosperity which had been gained since 1865 has been lost.* But no country has gone back to the old *régime* of prohibitions and obstructions which existed 50 years ago. Belgium, which is a very small country, dependent upon trade with its neighbors for almost everything, has afforded a marvelous example of the advantages of a liberal system. Until 1855 it maintained a protective tariff, under which its progress was extremely slow. Throwing off protective duties in 1855, it entered upon a career of wonderful prosperity; its manufactures and commerce increased at a rate unparalleled; and its career has been so remarkable that American protectionists have coolly referred to it as an example of the benefits of protection 30 years after protection had been abolished! Thus the fact is that the prosperity of Europe, such as it is, has come under a relaxation of commercial restrictions; and the cloud which has come over it has come under a partial renewal of those restrictions. There is another important factor, which shall be considered in connection with the progress of Great Britain as well as of Europe and the United States.

While, as already stated, Great Britain has never had the courage to adopt full freedom of trade, she has still come nearer to it than has any other nation. Down to 1825 she maintained a more rigid system of "protection" than the

United States ever knew, and much more rigid than any nation in Europe (except, perhaps, Russia) maintains to-day. Not merely were enormous duties levied upon all articles which were supposed to compete with British producers, but many such articles were absolutely prohibited. In 1825, under the leadership of Huskisson, considerable reductions were made in tariff taxes, and most prohibitions were repealed. But the rate of protective duties was still left very high, ranging from 25 to 75 per cent. No reduction was made in the taxes on foreign grain; and many articles of food were practically and some literally prohibited. This slight measure of relief to commerce was followed by a slight improvement. Whereas, in the preceding 20 years, the value of British exports had increased only from \$184,000,000 to \$188,000,000, or at the rate of \$200,000 per annum, they increased, during the next 12 years, to \$230,000,000, or at the rate of \$3,500,000 per annum. Here, however, progress stopped. From 1837-42 there was no increase whatever in the value of British exports. The Whig Government, altho favorable to greater freedom of trade, had not the courage or the power to relax commercial restrictions, and even deemed itself forced, by the necessities of revenue, to increase duties—a measure which failed to bring revenue, because the duties were too high already, but which did injure commerce and manufactures seriously. In 1841 the Whigs were turned out of office by Sir Robert Peel, who, altho a Tory, had the courage to reduce duties and to impose an income tax—measures which he could compel his party to accept and the House of Lords to pass, but which the Whigs could not possibly have carried. These measures gave some immediate relief, altho he left foreign food substantially prohibited except in times of famine. In the next four years, from 1842-46, British exports increased from \$230,000,000 to \$280,000,000, or at the rate of \$12,500,000 per annum. This progress was ten times as rapid as that which had taken place, upon the average, during the preceding 37 years of stringent protection. This practical test, combined with the unanswerable logic of Richard Cobden, entirely converted Sir Robert Peel. In 1846 he declared himself in favor of entire free trade, repealed the very corn laws which he had come into power for the purpose of sustaining, and reduced all protective duties to very low rates. His work was carried on after his death, in 1850, by his disciple, William E. Gladstone, who, in 1853, abolished most of the protective duties remaining, and in 1860 abolished all the rest. In 1849 one half of the navigation laws were repealed by the Whigs, with the help of Peel; and all the rest were repealed by the ministry of which Gladstone formed a part in 1854. Under this policy, British exports increased at a rate never dreamed of before. Whereas, under the fully protective and semi-protective systems, they had increased less than \$100,000,000 in 40 years, they increased over \$640,000,000 in the next 20 years—that is, from \$280,000,000 in 1846 to \$920,000,000 in 1866. In order to appreciate the value of these figures, it must be remem-

Great
Britain.

* Undoubtedly a large part of this depression has been caused by the increase of standing armies. But these armies were very large, and were greatly increased during the period of lower tariffs and rising prosperity.

bered that the greater part of British manufactures are and long have been exported ; so that the export figures have for very many years afforded the best attainable statistics of the progress of production and wealth.

The same results followed the adoption of free trade in navigation. The navigation laws, originally enacted by Cromwell, out of hatred toward the Dutch, were the pattern of those maintained in America to-day. They rigidly forbade the purchase of foreign ships, the manning of British ships by foreigners, the importation of goods in foreign ships from any ports except those of the country in which such goods were produced, and so on. Even Adam Smith, while clear-headed enough to see that such laws made commerce expensive, was deluded into the belief that they really promoted the growth of British shipping, and were, therefore, justified as a measure of national defense. But his error in this respect was demonstrated by the immediate effects of the repeal of these laws, which was begun in 1849 and completed in 1854. The increase in British shipping was slower, under those laws, than it had been before. This was soon pointed out by one or two exceptionally intelligent writers ; but their criticisms were unheeded. But by 1840 the failure of the restrictive system had become so marked that it attracted general attention. During the 24 years preceding British shipping had increased by only 80,000 tons. In 1849 all restrictions upon foreign ships in foreign trade were abolished. The increase in British shipping then became much greater in every year than it had been in the whole 24 years from 1816-40. In 1854 the coasting trade was thrown open to all ships, and the last vestige of "protection to British shipping" was done away with. The result was an enormous and utterly unprecedented increase in British ships and commerce. Whereas in 1849 British registered shipping amounted to only 3,486,000 tons, in 1859 it amounted to 4,663,000 tons ; in 1879 to 6,580,000 tons, and in 1892 to 8,645,000 tons.

All these measures of reform were opposed by precisely the same arguments and in almost precisely the words which are in daily use in America now. The protected interests declared that not only they, but also the whole country, would be ruined by free trade. They were so clamorous and so sincere that they carried with them vast numbers of men whose own personal interests were on the side of free trade ; and thus the reign of protection was prolonged for 70 years after Adam Smith had so clearly proved its folly as to convert to his views the great William Pitt and all the real statesmen of his time. When the repeal of the navigation laws was seriously proposed immense processions of sailors were organized by the ship-owners to remonstrate against a scheme which, it was asserted, would destroy their means of living. So long as the manufacturers generally continued to believe in protection, it was a common expedient with them to secretly organize mobs to overawe Parliament, and to assail with actual violence statesmen who dared to resist their extortionate demands. It was shortly after a distinguished friend of his had been thus attacked that Adam Smith wrote that famous passage in which he says : "The member of Parliament who supports every proposal for strengthening monopoly is sure to acquire not only the reputation of understanding trade, but great popularity and influence with an order of men whose numbers and wealth render them of great importance. If he opposes them, and still more, if he have authority enough to be able to thwart them, neither the most acknowledged probity, nor the highest rank, nor the greatest public services can protect him from the

most infamous abuse and detraction, from personal insults, nor sometimes from real danger, arising from the insolent outrage of furious and disappointed monopolists." No one who knows anything of the history of the free trade agitation in America can fail to recognize the correctness of this description as being quite as applicable here as in England. This was precisely the experience of Albert Gallatin, who, after rendering to his country the greatest services at home and abroad, was made the subject of the grossest insults by Henry Clay and by the whole manufacturers' party, simply because in his later years he took a leading part in overthrowing the oppressive tariff of 1828. In our own time it has been the experience of many advocates of freedom of trade, but especially of David A. Wells, who after reducing to an intelligible system the monstrous and ruinous methods of internal taxation, fastened upon the country by the ignorant and utterly incompetent Ways and Means Committee of 1864, and thus rescuing the manufacturers of the United States from an amount of oppression for which no tariff could compensate, was made the subject of the coarsest attacks by Henry C. Carey, Horace Greeley, and William D. Kelley the moment he dared to expose the failure of protection to protect. And altho James A. Garfield came gallantly to his defence, and declared, with perfect truth, that no other man had rendered equal service to the nation since the close of the war, and especially to the manufacturers, the same falsehoods and the same abuse have followed Mr. Wells from the hired scribes of "infuriated monopolists" down to this day.

The triumph of Adam Smith's ideas in his own country has been complete, altho he thought it impossible. And every word of his predictions as to the results which would follow the adoption of free trade has been fulfilled. So far from being ruined, or even injured, the prosperity and wealth of Great Britain have increased at a rate previously inconceivable. This prosperity has been shared by the great mass of the community, altho not as equally as should have been the case, for the simple reason that full free trade has not been adopted ; indirect taxation continues to be the chief source of revenue, and the poor therefore still bear the double burdens of rent and taxation. Wages have advanced largely ; the masses have, man for man, at least twice as much food, three times as much meat and sugar, twice as good clothing, and three or four times as much of the other comforts of life as they had under the protective system, and it is a very modest estimate to say that the poorest mechanics and artisans in England are 100 per cent. better off under partial free trade than they ever were before. But the improvement among the great middle class is far greater, and cannot be reckoned at less than 200 per cent. Unequal as is the distribution of wealth in Great Britain, it has become much less unequal than it was under protection, and there is a slow tendency toward greater equality, while in America there is a rapid tendency toward greater concentration of wealth.

The success of free trade in England is not seriously disputed by any honest and intelligent students of her history. But protectionists meet this argument in several ways. They assert that free trade is only successful because England is such a small country, that the increase of English trade has been paralleled by protective countries, and, above all, that "England built up her industries by protection until they were strong enough to compete under free trade." We will consider these arguments briefly. The first needs little comment. The idea that free trade is more endurable in a small country than in a large one is simply a perversion of the truth that a large country is generally better able to endure the burdens of so-called protection than a small one. It usually has more wealth, and therefore it can lose more without being ruined than a poorer country can. The fact that other countries have shared in the prosperity of Great Britain, altho adhering to protection, is easily explained. It is impossible for any country to increase its exports without also increasing its imports ; indeed, it was the intention in adopting free trade to increase imports. It was impossible to increase British imports without increasing to precisely the same extent the collective exports of other countries, or to increase British exports without increasing to the same extent imports of other countries. That is self-evident. Accordingly, even if other countries had no other source of increased prosperity, a certain amount would be

Opposition.

Adam
Smith.

forced upon them by British trade. And it will be readily seen upon examination of the trade returns of European countries adhering to the protective system, that they have simply followed in the wake of Great Britain, and that such prosperity as they have is fully accounted for by the degree to which free trade has been forced upon them, in spite of their tariffs, partly by the open ports of England and partly by their own railways, constructed under the influence of English example. It is, indeed, one of the chief glories of free trade that it necessarily distributes its blessings over all the world, and that while conferring much the greater part of its benefits upon the nation which has the good sense to adopt it, it has still a vast amount left for less enlightened countries. There remains the assertion that England built up her industries by protection and that it was by centuries of protection that she prepared herself for free trade. The facts which could be adduced in refutation of this statement are so innumerable that no attempt can be made here to mention more than a few. It is quite true that England maintained the policy of commercial restriction for centuries. It is also true that during all those centuries, except the last, England had no decent roads, no canals, and none of the modern facilities for internal communication. Nevertheless, she prospered, after a fashion. There is quite as much reason for attributing her prosperity to these defects or to the universal lack of education among her people, to their coarseness, ignorance, and brutality, to the savage criminal laws, to the cruel laws which tied laborers to their birthplace, or to any of the other barbarisms of merry old England, as to the protective statutes which formed part of a consistent system, by which the landowners deliberately sought to keep the masses in abject ignorance and slavish dependence. All these laws and customs obviously hindered the growth of English industries, and that the laws restricting foreign commerce were the greatest hindrance of all was proved by the fact that after almost all other wicked statutes were repealed, after the manners of the people had been greatly improved and their morals elevated, and after England had been provided with the best roads and canals of any country in the world, its progress continued to be very slow. Such progress as was made in manufactures and commerce was made in spite of the pretended "protection" of ignorant legislators. Manufactures obstinately refused to develop on the lines prescribed for them by British Solons. So anxious were they to promote the manufacture of wool that they at first absolutely prohibited the sale of cotton goods, and when forced to allow the manufacture of cotton, they imposed a heavy internal tax upon it, in order to make it cost nearly as much as woolsens. So stupid, too, were most of the cotton manufacturers, that having grown up under this tax, they opposed its repeal, which was secured, in spite of them, by the single-handed energy of Arkwright. Yet its repeal, of course, led to an immediate and enormous development of the manufacture, which, as everybody knows, soon far outstripped the woolen manufacture and became the most important industry of England. When it had thus become firmly established, the cotton manufacture, like all other big infant industries, demanded and received "the fostering hand of protection," in the form of prohibitory taxes upon foreign competitors, who were then practically non-existent. This is the most prominent example of an endless series of blunders, by which the legislation demanded by selfish manufacturers really "protected" English manufactures from attaining their natural growth. By 1840 nearly all the paternal legislation of England, with regard to domestic industry, had been repealed, with the exception of protection against foreign competition. Great results were expected, but they did not come. The masses of the people were not half fed or a quarter clothed compared with what they needed to make life endurable. Their desperate poverty reacted upon the whole producing class, which could not find customers either at home or abroad. The entire manufacturing community found themselves upon the verge of ruin. They were being protected to death. At last their eyes were opened, and with substantial unanimity they implored Parliament to repeal all the laws which their own class had so fiercely insisted upon in the days of Adam Smith, to open British ports, and to allow unlimited foreign competition. Unfortunately the arguments of their predecessors had persuaded the landlords, who ruled the country, that protection was a good thing all around. So foreign

Opposing Arguments.

food had been prohibited, in order to raise farm rents, and now the landlords insisted upon maintaining their share of protection, whatever the manufacturers might choose to do as to theirs. As to the starvation and misery of the people at large, that was no concern of the landlords. The people always had been miserable, and it was clear that God intended them to be so. Pious country gentlemen and sleek bishops regarded with horror the impiety of those who sought to extinguish poverty, exactly as the corresponding classes in America do now. "The poor ye have always with you," was a prediction which it would be blasphemy to make of none effect. Poverty and the people were united by divine decree: "What God hath joined, let not man put asunder." The masses had no votes, and it cost not only a tremendous political struggle, but also the sacrifice of thousands of lives in the terrible famine of 1846 to secure the repeal of the corn laws, with which fell the whole fabric of British protectionism.

VII. THE TRIUMPH OF FREE TRADE.

It has already been intimated that tariffs are not the only obstruction to trade, and that it is possible for trade to grow more free, through the removal of other obstructions, even while tariff barriers are raised higher than ever. It has always seemed to protectionists, both in Europe and America, a triumphant answer to all the claims of free traders, on account of the prosperity of England under free trade, to say that it was due much more to the spread of railways, steamships, and telegraphs than to free trade. But railways, steamships, canals, roads, telegraphs, and improvements of every kind in communication are all steps toward free trade. They create more free trade than all tariffs can destroy; and their *entire* value and benefit consists in the degree to which they introduce freedom of trade. The only "protection" which any tariff can give is by way of obstruction to trade. But what obstruction does a tax of \$10 a ton create compared with a mountain range or a distance of 500 miles, with no road except a mule path? While the pretentious statesmen of both Europe and America have been piling up obstructions to commerce in the form of hostile tariffs, they have generally been equally anxious to pull down much more effectual obstructions which had been raised by nature. We have already pointed out that the whole value of the American scheme of protection upon heavy and bulky goods has been destroyed, so far as the great West was concerned, by the rapid reduction in cost of transportation caused by railway extensions. But the same thing has been true of Europe. The great statesmen of Germany and Italy erected barriers against each other in the higher tariffs of 1879 and later years; and yet at the very same time they contributed millions of dollars to cut the St. Gothard tunnel through the Alps, destroying a natural barrier far more protective to native industry than any tariff. As soon as the tunnel was fairly open, German producers discovered that such was the result, and forthwith clamored for more tariff as a remedy for the injury done to them by the freedom of trade given by the tunnel. Railways and tunnels now run in every direction between all countries in Central Europe; and the freedom of trade thus given has nullified all the protection given by their absurd tariffs. Thiers was indeed the only consistent protectionist of note. He believed in the policy of restriction so sincerely that, so long as he remained prime-minister under Louis Phi-

lippe, he would not permit a single railway to be constructed in France. And while Belgium, as soon as she adopted the policy of comparative freedom of trade, promoted the greatest possible

extension of railways at the cheapest rates, France put all railways into the hands of a few monopolists, with the result of retarding her progress far behind that of

Europe.

her little neighbor. Great Britain was the first country to introduce railways; and by 1845 she began to do so upon an enormous scale. The extension of cheap transportation and the abolition of protective tariffs went hand in hand. The one, quite as much as the other, was a step toward freedom of trade. Unfortunately, the British Parliament, being composed exclusively of landlords, allowed landlords in general to extort enormous amounts of blackmail from the railway companies, thus imposing a burden upon them, which has made transportation unjustly expensive down to the present time, and so lessened the freedom of trade which railways ought to bring.

In the United States, the lesson is even more clear. The opening of the Erie Canal is universally recognized as the great cause of the prosperity of the State of New York, and as the decisive cause of the triumph of New York City over all its rivals—a triumph which has been perpetuated by the subsequent opening of the best lines of railway communication with the West. The immense extension of our railways has nullified all the devices of our protectionists, altho they have been able in part to nullify the benefits of our railways. Like the British landlords, they have made our railways too costly, and have loaded them with a burden which many of them can ill sustain. Our legislators did their best to deprive us of the vast advantage of cheap steel, and succeeded in adding about one half to the entire cost of construction for a quarter of a century; but they were utterly unable to deprive us of the blessing of that large share of free trade which resulted from the growth of the railway system. All the additional cost of our railways, which the protective tariff imposed upon us, is now plainly seen to be dead loss. It is represented in the shrunken market prices of stocks and bonds, in the ruin of the great Pacific lines, in the obliteration of values upon all lines constructed under the tariff tax of \$28 per ton on rails. It is some consolation to know that nearly nine tenths of this loss has fallen upon men who were the most eager advocates of that tax, which they have now paid out of their own pockets. This, however, is a digression, tho not an unprofitable one. The great fact to be observed is that freedom of trade has progressed here in the United States, in spite of all Morrill or McKinley tariffs, by the removal of natural barriers, which were vastly more efficient than any tariffs could be.

This accounts for our national prosperity; while it proves that, if no tariffs had interfered, our prosperity would now be immensely greater than it is. But it will be said:

"This, after all, only proves that greater freedom of interior trade is beneficial—which we do not deny. It does not prove that

greater freedom has been given to *foreign* trade." Yes, it does. Alike in Europe and in America, this increased facility of domestic trade necessarily carried with it an equal addition to facilities of foreign trade minus only such new obstructions as were created by new tariffs. On some articles, especially those of small bulk, in proportion to value the advance in duties exceeds the reduction in cost of transportation. Such articles have been kept out. But this only directed foreign trade to other articles of a different character; and those articles have come in, often in increasing quantities. We admit that the new tariffs have largely neutralized the benefit of our internal improvements; but this is all that they have been able to do. To a considerable extent the same nullification of tariffs has been going on in ocean navigation. When the Morrill tariffs of 1861 and 1864 were adopted, freight from Europe was brought almost exclusively in slow-sailing vessels. The time of passage averaged 40 days at least. Goods were slowly loaded by expensive hand labor, and were placed on board several days, sometimes weeks, before the ship sailed. Unloading was also a slow process. On the average, interest had to be allowed on goods for 60 days from the date of purchase. Insurance rates were high; and insurance was refused altogether upon the most frequent cases of damage just because they were so frequent. All these items had to be allowed for in the estimate of cost. Now, the same goods arrive, without fail, in 10 days after they are purchased, and are turned out upon the dock so quickly that the importer has hardly time to send for them. Insurance is cheap, and the old risks of damage are almost eliminated. In addition to all this, the great West keeps on growing; the rates of transportation westward are decreasing on foreign goods just as much as on any others; the Eastern States are doubtless given an opportunity to fleece the West to some extent, but they cannot supply the entire demand; and, upon the whole, no tariff can do more than somewhat to retard the progress of an ever-advancing freedom of trade. It is, indeed, the consciousness of this fact—not always distinct, but always felt—that makes the protected classes so greedy for more and more "protection." They find that the competition which they believed they had shut out comes creeping in again; and hence their eternal demand for more, and more, and still more restriction upon foreign trade, as exemplified in the old days of 1816, 1820, 1824, and 1828, and in the later days of 1861, 1863, 1864, 1866, 1867, 1868, 1870, 1872, 1875, 1882, 1883, 1890, and 1894, in every one of which years they demanded and obtained some increase of their impositions, while in every other year they demanded some other increase which they did not obtain. In the nature of things they can never stop, because nature and art are working continually against them; and the progress of free trade, altho slow, is irresistible.

FREMANTLE, The Hon. and Rev. WILLIAM HENRY, was born in 1831, the second son of the first Baron Cottosloe. Educated at Eton and Balliol College, Oxford, he held a fellowship of All Souls, 1855-63; ordained in 1858, he became curate at Middle Claydon, vicar of Lewknor, rector of St. Mary's, Bryanston Square, London, 1865, and canon residentiary of Canterbury Cathedral in 1882. In 1895 he was appointed Dean of Ripon. He has been a frequent writer, and in 1882 he gave the Bampton Lectures at Oxford on *The World as the Subject of Redemption*, in which he advocates the broadest application of Christianity to social and political life. (See **CHRISTIANITY AND SOCIAL REFORM.**)

FRENCH REVOLUTION, THE, played an important tho a frequently misunderstood part in social reform.

France was groaning under despotism, royal extravagance and financial ruin. In 1774 Louis XV. ended his profligate reign, brilliant only because of its literary men. Louis XVI., married in 1770 to Marie Antoinette of Austria, was pure,

The Causes. stubborn and weak. Turgot (*q.v.*), entrusted with the finances, tried to levy taxes equally. The nobility resisted, and in 1776 he was deposed. Necker followed, vainly trying to stave off national bankruptcy. France, aiding America against England, for five years fought England, and grew still poorer. The nobility and the higher clergy dodged the taxation; gaiety ruled in the court; the people hated the foreign queen. Finally in 1789, after various efforts with Parliament, the king was compelled to summon the states-general (see **ESTATES**) to vote taxes. Meanwhile, the writings of Rousseau and others were filling the people with ideals of equality. The First Estate, the clergy, returned to the assembly 291 members, 48 bishops and 208 parish priests, the poorer priests largely on the side of the people. The Second Estate, the nobility, returned 208 members. The Third Estate had 577 members, nearly half of them barristers. They met at Versailles. The king was stubborn, but they would not vote as he wished. June 17, 1789, they formed themselves into a national assembly, and June 20, on the neighboring tennis court, took an oath not to separate till "the constitution of the kingdom had been established and confirmed on solid foundations." The king attempted to compromise, but finally threw himself into the hands of his courtiers, and called out the army. Paris rose, and blood was shed July 12. July 14, the Bastille was taken. Uprisings occurred in the provinces. August 4 the old feudal rights were abrogated, and the famous Declaration of the Rights of Man declared. June 19, 1790, nobility was abolished. The nobles fled. The royal family finally attempted to do so, but were captured (June, 1791). The assembly was in control, and completed a constitution.

Republican-ism. Robespierre and other Republican leaders were, however, agitating in Paris for the deposition of the king. Violence broke out, and Lafayette put down the Republicans with bloodshed. September 14, the assembly completed its constitution and the king swore to obey it, and chose a Girondist cabinet. A Legislative Assembly elected under the constitution met October 1, 1791. Meanwhile, the nobility in foreign lands were gaining friends, and the king was declared to be conspiring with them. War was declared with Austria. The Girondist ministry was ejected, and they sided with the Jacobins against Lafayette as leader of the conservatives. June, 1792, the populace of Paris rose against the assembly, and marched to Versailles and forced the king to don the red cap. Meanwhile, Prussia declared war on France. The Jacobins organized a new insurrection August 10, sang the *Marseillaise*, and set up in Paris an insurrectionary commune. The people, under Robespierre and Danton, were victorious. Guillotining increased. The march of the Germans increased the terror, and September 21, 1792, the republic was declared. In the new national convention the Girondists on the right were in the majority; the Jacobins were high on the left, and called the "Mountain;" below sat the moderates. In November the king was accused, January 17, 1793, condemned, and

January 21 guillotined. Roland and the Girondists had tried to prevent it. It roused the hostility of all Europe. Demouriez, however, in command of the French armies, was successful, and entered Belgium. England now declared war (February 1, 1793), but the war spirit in France grew. Demouriez, however, was accused in Paris, and after a defeat he conspired with the Austrians and marched against France to overthrow the Jacobins. They created the terrible Committee of Public Safety. Disturbances broke out in the provinces, and La Vendée arose in a bloody insurrection. The Girondists in the south threatened Paris. The allies were slowly uniting.

It was a crisis. Some think that Danton, who, altho rough, was a sincere patriot, felt that a little bloodshed now would save bloodshed in the end. He led in a sanguinary policy. Marat, at the head of the Sans Culottes, overthrew the Girondists June 2, but was himself assassinated by Charlotte Corday. Danton made the convention proclaim martial law and a new constitution. A new calendar was proclaimed and statues erected and fêtes celebrated to Nature and Reason. The republic was successful on the field, insurrection put down, and the invaders repulsed. The queen, the leading Girondists and aristocrats, the cidivants were guillotined. Hébert now led the terrorists and Danton the moderates. Robespierre, who seems to have been an ambitious fop, sided with neither. Robespierre became dictator. The French armies were victorious, Napoleon being in charge of the artillery in Italy. Robespierre undertook to bring in "the fête of the Supreme Being." He trusted in his ideas, but was laughed at; he allowed the reign of terror to go on, and created personal hostilities. His arrest was voted, and he was guillotined. Paris was weary of revolution; the armies on the frontier were victorious, but, tho republicans, they by no means sympathized with affairs at home. January, 1795, the convention closed the Jacobin clubs, which had worked such evil. Famine broke out in Paris and insurrections broke out. They were easily put down and the power left with the bourgeois. A Girondist constitution was now declared. The death penalty was abolished, five dictators were to have power. The royalists made one last effort. Barras now called Napoleon to Paris, and his artillery cleared the streets and left Paris in the hands of the Directory. Baboué plotted his communistic conspiracy, but was put down. Napoleon was put at the head of the army in Italy, and commenced his brilliant succession of victories. **The End.** The Directory, however, at Paris was threatened, and was only sustained by recalling part of the army. In 1797 Napoleon entered Paris in triumph. He was, however, sent to Egypt, but victorious there, returned once more to Paris to find political weakness and division. A new constitution was proclaimed with consuls: one supreme, Napoleon. He established himself in the Tuileries, conducted brilliant war and a despotic policy, and May 18, 1804, had himself proclaimed Emperor. So ended the Revolution. (See **FRANCE.**)

It was in the beginning a parliamentary contest with the king over taxes. Revolutionists with ideas of the rights of man took the opportunity to rouse the suffering *canaille* of Paris to insurrection. Successful in the field against foreigners, they could not agree at home, and having unchained the spirit of terror, could not chain it till a strong hand came, and the people, weary of bloodshed, submitted to an empire. It established nothing; it simply ended the old *régime*. When the people grew strong again they overthrew the empire. It was thus led by bourgeois men, yet participated in by all classes. Its cries of "Liberty, equality, fraternity" were individualistic, not in the modern sense socialistic. Economically and politically it did with terror and confusion what was done legally in England and Germany by overthrowing despotism. It succeeded negatively; positively it failed because it lacked unity.

FRIENDLY SOCIETIES is the name used in Great Britain for voluntary benefit societies of any kind. They probably originated in the old burial clubs, which existed even in Greece and Rome. (See **GUILDS**.) During the Middle Ages they were mixed with the guilds. A revival of them seems to have occurred among the Protestant refugees of Spitalfields. An act of 1793 recognized and encouraged them. They were organized in great numbers, but with little stability. Trade-unions had long to hide beneath their name. (See **COMBINATION LAWS**.) After various laws a Royal Commission investi-

gated them (1870-74), and the act of 1875 regulated them (modified in 1887 and 1895). They are composed of orders like the Odd Fellows, Foresters, Rechabites, etc., general societies, county and town societies, trade societies, dividing societies, deposit societies, collecting societies, annuity societies, female societies, insurance societies, etc., registered and unregistered. In England 1 out of every 3 inhabitants is a member of a friendly society.

The latest returns made to the Registrars of Friendly Societies in the United Kingdom are :

	Number.	Members.	Funds.
Friendly Societies not collecting.....	28,384	4,203,601	£22,695,039

Railway Savings Banks.....	11	22,899	1,788,012
Total.....	35,559	11,089,317	£71,162,470

In Germany, the friendly societies are usually either trade-union, socialistic or otherwise, religious societies, Roman Catholic or Protestant, agricultural or industrial cooperative societies, or insurance societies working under the compulsory insurance laws. (See **GERMAN**.)

In France, friendly societies (*sociétés des secours mutuels*), without including trade-unions and cooperative societies, numbered, in 1892, 9662, with 1,503,397 members. According to the reports of the (English) Royal Commission on Labor, there are in Italy some 5000 benefit societies; in Holland, some 433, with branches all over the kingdom; in Switzerland, 1254. (For the United States, see **FRATERNAL SOCIETIES**; **INSURANCE**; **TRADE-UNIONS**.)

FROEBEL, FRIEDRICH WILHELM AUGUST, philosopher, educational reformer, and philanthropist, was born at Oberweissbach, in the Thuringian forest, Germany, in 1782. His father was pastor of the village church. His mother died when he was in his infancy, and he was neglected in consequence. At the village school he was considered stupid, and he was apprenticed to a forester. The forest then became his college. Every natural object—stone, insect, plant, or tree—suggested to him some general truth; and he perceived some underlying connection between all objects, however apparently remote from each other. His inborn tendency to mysticism was strengthened by his lonely meditations in the forest, but after overcoming many obstacles he at last obtained permission to attend the university at Jena. He went from professor to professor seeking for a connection between the sciences. His career at Jena ended ignominiously by his imprisonment for nine weeks through incurring a debt of \$7 or \$8. He returned home, was sent on a farm, and then, on the death of his father, was set free to shift for himself. He wandered about

as land surveyor, accountant, secretary, and at last became a very successful teacher in a model school at Frankfort. After a short time at a university, he was patriotic enough to enlist as a soldier for the campaign of 1813. It was while in the army that he gained his two most devoted followers, Langenthal and Middendorff. On the termination of the war, he returned to Berlin, and obtained a position under Professor Weiss. But his own ideal soon forced him to give up his position and to unfold his system of education. He set out on foot for Griesheim, a small village where a sister-in-law lived. Here he founded a school, composed at first only of his little nieces and nephews. Removing his school to Keilhau, he sent for his two friends Langenthal and Middendorff, and soon their pupils began to rapidly increase. Financially it was not profitable, and for many years the teachers suffered the hardships of poverty. Froebel opened another school in Switzerland, and the Swiss Government was wise enough to send young teachers to him for instruction. He discovered that one of the greatest obstacles in the way of a perfect education, or "self-completion," was the general neglect of children in their earlier years. His great work on *The Education of Man* (1826) deals chiefly with the child up to the age of seven. Returning from Switzerland, he founded at Keilhau the first kindergarten in 1837. He sought to base a course of educational exercises on the games in which children were most interested. His first kindergarten failed for lack of funds; but by pen and lecture he spread the principles of his system; and until his death he continued to train male and female teachers in the impartation of his ideas.

In 1851 his nephew published a book which the Government accused of teaching socialism and irreligion, and unfortunately confounding his views with Froebel's, an edict was issued for-

bidding the establishment of schools based on Froebel's principles. He took this greatly to heart, and in May, 1852, died, and was buried at Schweina.

The starting point of his researches was his belief in the unity of creation. Education meant with him unity of development, perfect evolution in accordance with the laws of his being. From this belief naturally followed his doctrine: "All education not founded on religion is unproductive."

He agreed with Pestalozzi in this belief: That the true educator *creates* nothing in the children, but guides the growth of inborn faculties. Children grow as plants grow. But he went beyond Pestalozzi in holding that the function of education was to develop the faculties by arousing *voluntary activity*. (See KINDERGARTEN.)

FRY, ELIZABETH (*née* GURNEY), was born at Earlham, Norfolk, England, in 1780. She was brought up a Friend, and in 1800 married to Joseph Fry. She visited and worked in behalf of the poor and sick, seamen, prisoners, and outcasts in all parts of Great Britain and on the Continent. In 1809 she became an occasional preacher, tho never neglecting the care of her large family. She is best known for her work in prison reform. (See PENOLOGY.)

FUGITIVE SLAVE LAW.—A United States fugitive act, passed in 1793, declared that

whenever a person held to service, etc., shall escape into another State or Territory, the person to whom such service may be due, his agent or attorney, may seize or arrest such fugitive and take him before any judge of a court of the United States, or any magistrate of a county, city, or town, and upon proof to the satisfaction of the judge or magistrate, whether by oral testimony or sworn affidavit, that service is owed as claimed, the judge or magistrate shall give a certificate thereof to the claimant, which shall be sufficient warrant to remove the fugitive.

This act, long obsolete, was later more and more made use of by the slaveholders of the South. That Northern States should be compelled to help Southern slaveholders catch their slaves created great indignation at the North. The constitutionality of the law was tested, but it was decided constitutional, two judges dissenting. This led to the passage of a still more rigorous bill in 1850. United States commissioners were to perform the judicial acts, and United States marshals execute warrants and processes. Owners could themselves pursue and demand the help of the commissioners and marshals. The sworn statement of the claimant was to be sufficient proof. Any aid rendered to fugitive slaves was made a penal offense, and all citizens were required to aid in the capture of the runaway, if required. This law almost more than any other roused the North. It was openly violated and resisted, tho often obeyed. After the war the fugitive slave laws were repealed.

G.

GALL, HEINRICH LUDWIG LAMPERT, whom Stegmann and Hugo's *Handbuch des Socialismus* calls "the first German socialist," was born in Aldenhoven bei Jülich, December 28, 1790. He held various clerkships in Government offices in Cleve, Düsseldorf, Luxemburg, and especially at Treves. The sufferings of the people after the War of 1815 moved him deeply; and even at this time he clearly analyzed the industrial situation and the social evolution which put all power into the hands of capitalists, and left the workers poor. Doing what he could to spread his ideas, he met with no encouragement, and in 1819 left his government situation to devote all his time and his considerable means to the service of social reform. He conducted to America an ill fated, ill planned company of the offscourings of German cities (thieves, convicts, and harlots), and organized a colony near Harrisburg, Pa. He believed he could make of them successful colonists; naturally he failed, exhausting his means, and receiving only criticism and opposition. Returning he entered the Government service once again, and made numerous inventions in distilling apparatus, etc., all to get the means to carry on his propaganda. He traveled in England and France, meeting Owen,

Fourier, and the Saint Simonians, and tried to form an international movement. He traveled all through Germany, even to East Prussia, oppressed with the condition of the masses. In 1828 he published a paper, *Menschenfreundliche Blätter* (Humanitarian Leaflets), but was compelled to discontinue it for lack of support. He wrote many books, especially *Mein Wollen und Mein Wirken* (1835), in which he outlines the principles of modern socialism, the helplessness of the individual worker, the need of industrial organization by the workers. Condemned to imprisonment in one of his travels, he fled to Treves, where he died January 31, 1863. See Stegmann and Hugo's *Handbuch des Socialismus* for a full account of him.

GAMBLING AND SPECULATION.—A fundamental principle of all good government is violated by gambling in any form, to wit:

"The presumption of law is that every man has acquired his property honestly; and it is the policy of every well-regulated government that he shall not be deprived of it without a fair equivalent. This is particularly the case in republics, where all should be independent in the means of subsistence" (State *vs.* Smith & Lane, 2 Yet [Tenn.], Reports).

Says Judge Catron, formerly of the Supreme Court of the United States :

"Gaming is a general evil, leads to vicious inclinations, destruction of morals, abandonment of industry and honest employments, a loss of self control and respect."

The English courts for centuries have held that :

"A common gambling-house, kept for lucre or gain, is a common nuisance, as it tends to draw together idle and evil-disposed persons, to corrupt their morals and ruin their fortunes."

In New York State common law prevailed until 1815, when the Legislature enacted a statute forbidding the act of betting or wagers upon future events. The New York Court of Appeals, in 1848, said :

"The evident intention of the Legislature was to discourage and repress gambling in all its forms, including bets and wagers and every species of wager contracts of hazard, as a great public mischief calling for effective measures of prevention and remedy" (Ruchman vs. Pitcher, 1 N. Y., 450).

Since then bills against gambling, pool-selling, etc., have been frequent in this and other States, the pool-selling on inclosed grounds has been frequently legalized and then again forbidden. The following account of various forms of gambling is abridged from an article by Mr. H. C. Vrooman, in the *Arena* for February, 1895 :

"The forms of gambling and speculation are almost endless. The older forms are with lotteries, faro, thimbles, dice, cards, and the like. Not to mention billiards and pool-playing for drinks, the raffles and chances at fairs—where under sometimes sacred auspices is fed the passion for gaining something for nothing—there is every grade of respectability and unrespectability. There is a very popular device coming much into use of late called 'a nickel in the slot.' It consists of a contrivance into which a nickel is dropped, and in case the nickel touches a certain spring it throws out a little shelf containing a handful of nickels. The shelves containing the prize handfuls are in sight under a glass cover, to encourage the player. Some of the machines are large and gorgeous, with the money shelves arranged in a circle which revolves like a wheel of fortune. This contrivance is within reach of the boys, and initiates them into a taste for 'trying their luck.' It requires but five cents, and there is a chance of winning over a dollar. These machines are most common in saloons, but are not infrequently found in candy-stores near schools, where the boys crowd at noontime to take their initial lesson in gambling.

"Another interesting device that requires but a small sum to invest in is called 'shooting craps.' It is played on a semicircular table with dice. The point of the game is in certain relations of the dice points to numbers on the board. It seems very trite to describe it, but when money is staked on it it develops into an exciting game. It is a favorite with those with very short purses, especially the negroes. It is a most striking spectacle to see hundreds of negroes gathered in a city den awaiting their turn to lose their money.

"Horse-racing furnishes a very popular method of gambling on a larger scale. For those who cannot go to the tracks and do their betting there, there are popular resorts, known as 'pool-rooms,' where 'the odds' are posted and bets taken just as at the track. The popular name 'pool' is a survival from the old French mutual pool system, still in vogue in some places in the South. It is very similar to a 'blind pool.' That is, each player put in a certain sum against some other player, and the book-maker or manager acted merely as a commission agent.

Pool-Rooms. The old process was too slow for the ambitious American, and the method now in vogue gives the book-maker one side in every play, and is usually so arranged as to give 60 per cent. odds in his favor. The 'book-

maker' is the manager of the pool-room. He makes a schedule of the horses running and an estimate of the proportion of chances in favor of each, based on the horse's record, the weather, the jockey, etc. This schedule, 'the book'—most commonly called 'the odds'—is posted in the 'pool-room' 20 minutes before the race occurs, and betting continues until the telegraph announces, 'They're off.' The race may occur in New Orleans and the playing in Chicago. The telegraph enables the playing to proceed the same as at the race-track.

"The betting by the individuals is called playing the races.' The book-maker plays against the public. Of course he must be a shrewd, experienced horse man. He arranges the odds on the basis of the patrons playing on a variety of the horses and balances his risks by their variety. The following is an illustration of 'the odds': Gallop, 7-5; Theodore, 3-2; Baby Bill, 8. This means that the book-maker will stake \$7 against \$5 on Gallop, \$3 against \$2 on Theodore, and \$8 against \$1 on Baby Bill. The option is open for the player to take any horse he wishes. The book-maker must either know public sentiment in regard to what bets will probably be taken, or he must start rumors afloat to create a sentiment that will turn bets to his advantage. If races were run honestly, a good judge of horses could often win; but often, at least, they are not. A book-maker 'stands in' with some jockey to prevent a fast horse winning, perhaps by tying a small silken thread around the hind ankle, which pulls the cords and cramps the leg. An electric battery has been carried by jockeys with wires connected with the spurs to partly paralyze a horse. A horse may be filled with water just before a race, having been previously liberally fed with salt. Sometimes a fast horse is entered under another name, etc.

"Next to the horse-racing ranks the 'clock' or 'tape game,' the 'bucket shop,' the 'open board,' and the regular 'board of trade'—thence on to the subtleties and refinements of general speculative business, such as booming cities to sell real estate, watering stock, manipulating **Bucket Shop.** ing railroads to buy cheap and sell dear, etc. The 'clock game' and the 'bucket shop' are based on the board of trade methods, only they are gambling pure and simple, never dealing in real commodities at all. The 'clock game' is especially barren of any semblance to real business in that the prices quoted do not follow the market, but are arbitrarily arranged by the management. There is a central office, where a scale of prices is made up every day on fictitious mining stocks and sent out, with the legitimate prices of wheat and corn and the regular board of trade articles, to the various gambling-rooms, where the little tickers record on the tape the rise and fall in price. These figures are placed as fast as they come in on a vast blackboard on one side of the room, and the crowd buy and sell the artificial margins in regular 'Change' style. Some of them do not even go through the form of pretending to receive by telegraph the regular market prices. The manager makes up a schedule of prices purely from his imagination, adapted to trap the gambling public. This is made on a roll of tape, is unwound right before the crowd, and the prices of stocks are recorded on the blackboard. The buying or selling of margins goes on, based on the last recorded figure on the board, looking for gain to the chance of a higher or lower figure on the tape.

"The 'bucket shop' is similar to the above, except that the schedule of prices on which the gambling is based is supposed to follow the actual market as quoted in the board of trade. The 'open board,' as seen in Chicago, is a duplicate of the regular board of trade in form, but is an immense bucket shop in character. The marked difference between the board of trade and the bucket shop is that the speculations on the board of trade have to do with the actual market, and heavy buying or selling there is supposed to influence the price of the commodities, while speculation in the bucket shop is gambling pure and simple on how the market is going to turn."

From the "bucket shop" to speculation in the regular stock exchanges is but a single step. Says Mr. John Bigelow (*Harper's Monthly*, February, 1895) :

"Between the years 1879 and 1882 the cash sales of wheat at the New York Produce Exchange amounted to \$244,737,000, while the option sales, embracing what are known on 'Change as 'puts' and 'calls,' 'long' and

'short,' 'futures' and 'straddles,' amounted to \$1,154,207,000. This last enormous sum represents exclusively the stakes of gamblers at the Produce Exchange alone, in a single city, and on a single agricultural product, during a period of only three years. It was also in proof that this form of gambling was carried on in oats, in barley, and in other cereals, and to a very large extent in pork and lard, and in pretty much all staple products.

Stock Gambling.

It was also shown that the amount thus staked upon the course of the market in Milwaukee was fully as much as, and in Chicago was probably double, the amount staked in New York. When to this we add the sums staked upon the fluctuations of the market at the Stock, Cotton, Mining, and other exchanges, we find that the amount bought and sold on an average every three years will fall but a little, if at all, short of the assessed value of the entire property of the nation. . . . Fifty-two million bales of cotton were dealt in on the New York Exchange during the cotton season of 1892, and 16,000,000 bales on the New Orleans Exchange—68,000,000 in all; while only 7,750,000 bales were grown in the entire country, and of these only 419,000 bales were shipped to New York."

It is not difficult to see that this is gambling. One may, however, go farther. It is not easy to draw the line between such stock gambling and speculation in real estate, or even in ordinary business. Says a tract on *Success in Speculation*, published by a Chicago "stock exchange":

"A speculator has been defined as 'one who buys securities or commodities for other than investment purposes.' That is to say, a person who has reason to believe that a particular stock is worth more money than its current price in the open market, and who buys the same not to hold for the income it may bring, in the shape of dividends, etc., but to sell out at the first opportunity which presents a satisfactory profit. The authority quoted adds that the definition applies the same, whether the stock is bought outright or on a margin. It is not easy to see why a dealer in real estate, who is not an investor, is not a speculator, under the same rule; or the shipper of potatoes, who gets his draft, made against his consignment on the Chicago market commission house, discounted at the local bank in Iowa; or the jobber in Fall River prints, who buys by the car load to anticipate an advance of one sixteenth of a cent in the market. But the country has said that the dealer in stocks and grain and provisions, no matter how sharp and conservative a trader he may be, is a speculator."

In the article quoted above, Mr. Bigelow concludes that gambling is a moral rather than a political disorder, tho government can do something. He says:

"It should lay its heavy hand upon all who make it their business or calling to provide houses, tables, dens, or any facilities for gaming from which they are to derive a revenue. In the exercise of such a power the legislature would be little likely to interfere with the proper liberty of the individual, and pretty certain to discourage to a very considerable extent the vice that now goes by the name of gambling, by rendering its instruments criminal and infamous. Such a law might in some degree, substantially perhaps, reinforce those reformers who are endeavoring to avail themselves of loftier agencies to extinguish the inclination to gamble. The proper and only radical cure is to educate people to be ashamed to prey upon each other in this way; but a law-making criminal all who live by facilitating and encouraging others in the vice may prove an important ally of the pulpit and the press in resisting the spread of the most demoralizing of all demoralizing propensities." (See LOTTERIES.)

References: Article by John Bigelow, *Harper's Monthly*, February, 1895, a symposium on gambling and speculation in *The Arena* for February, 1895, with a bibliography.

GARNIER, JOSEPH, was born at Beuil, France, in 1813. Studying at the *École supérieure du commerce*, he became professor and

then director of the school, and in 1846 Professor of Political Economy in the *École des ponts et chaussées*. Of the school of *laissez faire*, he was one of the founders, in 1842, of the *Société d'économie politique*; and in 1846 of the *Association pour la liberté des échanges*. He helped establish and long edited the *Journal des Économistes*, and also the *Annuaire de l'économie politique*. His *Traité de l'économie politique* passed through many editions, as also his work on finance. He died in 1881.

GARRISON, WILLIAM LLOYD, was born in Newburyport, Mass., December 10, 1805. His father was a sea captain of some ability, but falling into irregular habits, he deserted his wife, and Garrison, when only nine years old, was apprenticed to a shoemaker, and afterward to a cabinet-maker. At 13 years of age he was apprenticed to the printer of the *Newburyport Herald*. At the age of 16 he began to write unsigned articles for the papers, and soon became editor of the *Herald*. Removing to Boston, he worked for a time as a journeyman printer, and became editor, in 1828, of the *National Philanthropist*, the first American journal established to promote total abstinence. This he conducted for six months, and then, in the fall of 1828, went to Bennington, Vt., to establish the *Journal of the Times*.

While in Boston he met with Benjamin Lundy, a Quaker philanthropist, who was editor of a small magazine named the *Genius of Universal Emancipation*, published in Baltimore. He resolved to ask Garrison to aid him, and for that purpose walked from Baltimore to Bennington. He succeeded; and Garrison determined to devote his life to this work. From 1829 the paper was published weekly by Lundy and Garrison—Lundy favoring gradual and Garrison immediate emancipation. Baltimore was one of the chief markets of the domestic slave trade, and Garrison thundered prophetic denunciations at the traffic. The owner of a Newburyport vessel had allowed his vessel to carry a cargo of slaves from Baltimore to New Orleans; and for denouncing this act Garrison was arrested and fined \$50 and costs. In default of payment he was committed to jail. His imprisonment created much indignant comment. Arthur Tappan, a New York merchant, paid his fine, and he was set free. In order to speak more freely, he dissolved partnership with Lundy, and started a paper of his own in Boston. Before commencing its publication he privately interviewed some of the leading citizens, merchants, politicians, and ministers; but they all excused themselves. He and his brave partner, Isaac Knapp, issued the first number of *The Liberator* on January 1, 1831. It began without capital and without subscribers, its editors publishing their resolve to print it "as long as they could subsist on bread and water." Its motto was, "Our country is the world; our countrymen are mankind;" and Garrison, in his address to the public, uttered the historic words which embody the whole spirit and purpose of his life: "I am in earnest; I will not equivocate; I will not excuse; I will not retreat a single inch; and I will be heard." Such a spirit could not but bring triumph in the end,

and the paper lived long enough to publish the proclamation of emancipation and the extinction of slavery. But Garrison and his partner met every opposition. Their office was a garret, their bed its floor, and their only helper was a negro boy. The mail frequently brought letters to Garrison threatening his assassination if he did not discontinue his journal; while the Legislature of Georgia offered \$5000 to any one who should arrest, bring to trial, and prosecute him. The first society organized to support his principles was the New England Anti-Slavery Society, formed January, 1832. In the spring of the same year Garrison published *Thoughts on African Colonization*, proving by official documents that the American Colonization Society was organized in the interests of slavery. Garrison was soon after deputed to visit England and expose the true character of this colonization society, as its agents had been successful in deceiving some of the English abolitionists. He spent the summer of 1833 in England, and was warmly received, becoming acquainted with Wilberforce, Clarkson, Brougham, O'Connell, Thompson, and others.

The success of his mission brought fresh outbursts of rage and hate from the American slavery defenders. Thompson came over to America to address meetings. Wherever he appeared it was the signal for riots and violence. In Boston "a mob of gentlemen of property and standing," when they heard that Thompson was about to address the Women's Anti-Slavery Society of that city, turned the streets into a bedlam. Garrison fell into their hands; and, throwing a rope around his body, they dragged him through the streets. In all probability he would have been hung by the mob had he not been rescued and consigned to the jail for safety. These attempts to suppress the abolitionists by violence continued several years, but Garrison was never daunted. There was no schism in the body of abolitionists until 1839, when some of the adherents began to accuse Garrison of religious heterodoxy and to blame him for his severity on the churches for their moral stagnancy and complicity with slavery. Garrison was a non-resistant, and believed in the use of moral rather than political means. Those who differed from him formed a new National Anti-Slavery Society in 1840, and gave rise to the Liberty Party in politics. Garrison's mind was never narrowed by its intensity, however; and he always esteemed and honored every earnest opponent of slavery, even tho their special modes of working differed. He was intolerant only of treachery. After long and painful consideration he realized that the pro-slavery clauses of the United States Constitution were immoral, and that it was wrong to take an oath for its support. "No union with slave-holders" was his motto; and he prophetically denounced the Constitution as "a covenant with death and an agreement with hell." Arguments and exposures buttressed his denunciations. The blind and idolatrous reverence of the Constitution, which had been the political mainstay of the slave-holders, began to abate. The Fugitive Slave Law revealed to all the practical workings of the pro-slavery clauses. On the outbreak of the war,

Garrison at once ceased advocating disunion, as he foresaw that in the struggle slavery would be abolished. During the war Lincoln recognized and honored his services; and the whole nation knew that if emancipation were secured, it would be due to his uncompromising spirit and heroic perseverance. In 1865, when liberty had been proclaimed, he declared that his career as an abolitionist was necessarily ended, discontinued the *Liberator*, and counseled the dissolution of the Anti-Slavery Society. Garrison had revisited England in 1840 and 1846. In 1867 he again crossed the Atlantic, and was received with great honor in London, Edinburgh, and other cities. He made a fifth and final visit in 1877. On May 24, 1879, he died in New York, and was buried in Boston after a most impressive funeral service. In 1852 selections from his writings and speeches were published, and since his death his life has been published by his sons in four large octavo volumes. Garrison never sought emancipation by means of war. He believed that under sufficient moral pressure the South would voluntarily release her bondmen. If his counsel had been heeded, no retributive war would have followed; but the people of his time were not wise unto salvation. The mercantile spirit was too strong to bear the thought of financial sacrifice, and the war brought what Garrison saw come as "the child of force and blood."

GAS, MUNICIPAL, IN THE UNITED STATES.—The following American cities own their gas-works :

CITIES.	Date of Beginning Ownership.	Population in 1890.
Philadelphia, Pa.....	1841	1,046,944
Richmond, Va.....	1852	81,388
Alexandria, Va.....	1853	14,330
Henderson, Ky.....	1867	8,835
Wheeling, W. Va.....	1870	35,013
Bellefontaine, O.....	1873	4,238
Danville, Va.....	1876	10,305
Charlottesville, Va.....	1876	5,562
Hamilton, O.....	1890	17,565
Fredericksburg, Va.....	1891	4,528
Middleborough, Mass.....	1894	6,065
Wakefield, Mass.....	1894	6,982

No data are at hand regarding the last two towns. Altho flattering offers have been made by private companies that desired to buy out these public-owned works, only one city has ever yielded—Frankfort, Ky.—many years ago. Even in that city the sale was not very popular, and a considerable party is now rising there favorable to a resumption of city ownership.

There are many indications that a popular vote would endorse city management of gas works in scores of cities, but legislative bodies, city charters, and even in some cases, perhaps, State constitutions, prevent any expression of the will of the people. In Massachusetts many prominent citizens have expressed themselves as ready to vote for city ownership as soon as the law is so changed as to enable cities to buy

out existing plants at their actual cost less depreciation. A step was taken in that direction in 1893, when the law was so changed that the adjudicators that are appointed by the Supreme

Court of the State in every such case were freed from the previous

Legality. necessity of allowing for "the earning capacity of such plant based

upon the actual earnings being derived from such use at the time of the final vote of such city or town to establish a plant." Neither is the court, even according to the act of 1891, to consider the "enhancement of future earning capacity or good will or of exclusive privileges derived from rights in the public streets;" but until it is expressly forbidden, the court or its agent may value the plant higher than its cost less all forms of depreciation.

The law-makers of Massachusetts have tied up matters in a way to make the beginning of city ownership unusually difficult. The people are not allowed to vote on the question at all until each branch of the city council—and two branches are common in Massachusetts—has approved of city ownership by a two-thirds vote in each of two consecutive years. The mayor must then ratify. If he refuses, another two-thirds majority in the same city council must be secured. Then a majority of the people voting thereon at an annual election must approve. If they vote "no," then no similar vote can be taken by the people for three years.

Another reason for the slow growth of municipal gas, as contrasted with the rapid growth of municipal electric light, tho the former is more profitable, is that the latter has largely driven out gas for street lighting, and the American people have not yet seen, as have the Germans, that as long as the gas business is a monopoly and of vital importance to the private consumer, the city as a corporate body has as much interest in the business as in the lighting of its streets and parks. Then, again, the competition between electric light construction companies is keener than between the makers of gas apparatus. The former, therefore, in order to get business, have sometimes encouraged city ownership, while the latter companies have found it to their interest to discourage the same.

In 1894, the last year for which full returns are at hand, the only Virginia cities selling gas as low as \$1 were Charlottesville, Danville, and Richmond, which own their works. Henderson was the only city in Kentucky with \$1 gas; and the lowest price in West Virginia was 75 cents, at Wheeling. Two of the nine Ohio cities furnishing gas at \$1 or less were Hamilton and Bellefontaine, the two having city ownership. Most of the other seven were very much larger places, such as Cincinnati, Cleveland, Columbus, and Toledo.

The Philadelphia gas-works, erected by a private company in 1835, and purchased by the city in 1841, had been entirely paid for from net profits by 1890, barring a net debt of \$1,300,000. The net earnings since then, to say nothing of the value of the gas used in the street lamps and public buildings, have far more than equaled this balance of debt. For many years

prior to 1887 the gas-works were corruptly and wastefully managed by a body of trustees that, through an unfortunate provision of law, could not be investigated and controlled by the city council Philadelphia that appointed them. Yet, despite Gas-Works.

all this, there was but one year (1886) of this 56 years when the price of gas was not materially lower in Philadelphia than in New York City, where, at the end of the time, the city could not boast, as could Philadelphia, of free public gas and of a property almost free of debt, for which \$20,000,000 was offered in 1896. The scandals of private-owned gas-works in New York City and of private-owned street railways in both Philadelphia and New York have equalled or exceeded any connected with the Philadelphia Gas Trust prior to 1887. Since April, 1887, the people of Philadelphia have enjoyed a new city charter, placing power in gas matters in a single and responsible head. Civil service reform has made considerable progress, and the worst abuses have disappeared.

The great trouble now is the unwillingness of the city council to appropriate sufficient money to enable the gas department to improve its distributing system, and thus reduce by one half its leakage, amounting in 1895 to 22 per cent. The council also refuses to appropriate money for improving the manufacturing department. The city is thereby forced to buy about 40 per cent. of its gas at 37 cents per 1000 ft. in the holder from a private water gas company, and to make the rest, which is coal gas, at somewhat higher cost than would be necessary with a better plant. A leading gas journal, devoted to private ownership, editorially intimates that this hesitation of the council to improve the city plant is due to its conviction that more is to be made by its members through wrecking the city plant and then selling it to the private company that supplies the water gas, than by improving the city gas. The Philadelphia experience gives a warning against a mixed public and private ownership. Because of the admission of this private manufacturing plant in 1887, with all the temptations incident thereto, at a time when the city was prevented by constitutional limitations from incurring a debt to enlarge its plant, Philadelphia is hardly a fair sample of city ownership.

Notwithstanding all these drawbacks, the city, during the six years 1888-93 inclusive, not only added \$2,497,059.04 of extensions to a plant whose cost, less all depreciation, was under \$6,200,000 in 1888, but it secured a net cash return of \$872,005.52 a year. It would have been about \$272,000 a year if the gas had been sold during those years at the New York price of \$1.25 instead of at \$1.50. In addition to this, the city secured free an average yearly amount for public use of 573,895,400 ft. This, at \$1 per 1000 ft., which was as low as the price charged New York City, amounted to \$573,895.40 a year. Thus, the city, even on the basis of \$1.25 to private consumers and \$1 to itself, earned during 1888-93 \$845,895.40 a year, besides \$416,176.50 a year for extensions. In 1894, when the price of gas to private consumers was reduced from \$1.50 to \$1, Philadelphia, after allowing for ex-

tensions and the value at \$1 of the public used gas, had a surplus of somewhat over \$400,000. In 1895 it was \$808,936.62, or fully 10 per cent. on the cost of the plant, less depreciation. If the city council would make the moderate improvements necessary to reduce the leakage from 19.78 per cent. of the 4,422,752,000 ft. made in the holder to 10 per cent., the saving in gas would soon pay for the cost.

Richmond, Va., like Philadelphia and many of the best private plants, has a combined coal and water gas plant, but, unlike Philadelphia, Richmond owns the

Other Cities. entire system. With a leakage in 1895 of 12.5 per cent., it distributed at the burner 182,817,003 cub. ft. of gas at a net cost, as in 1894, of about 70 cents, or, including extensions, about 78 cents. The plant being paid for, the city sells at \$1, and secures a net return of about 22 cents. Coal is \$3 a ton, and the oil used is 4 cents a gallon. In 1895 an investigation disclosed some shortage in the accounts and a few suspicious contracts, but more rigid accounting is now in vogue. The labor force seems a little too large; and it is not clear that the works have secured the best apparatus as in Philadelphia; but on the whole the people of Richmond believe that they have fared much better than they would have done from a private company.

Alexandria, Va., is selling gas for \$1.33, and has devoted most of the net revenue the last three years to improving the plant. No scandals seem to have been connected with this or the other public Virginia gas-works considered below. Altho progressiveness is not characteristic of Alexandria, with its grass-grown streets, or of some of the other gas-owning cities, more progressiveness attaches to their gas-works than to many other departments of their administration.

Henderson, Ky., has had success with her gas-works, and has sold gas since early in 1894 for \$1. As she remodeled her works in 1895-96, late returns are unavailable.

Wheeling, W. Va., during 1895-96 has somewhat improved her plant. With about 100,000,000 ft. yearly used in the burner, and with coal about \$1.50 a ton, but coke only 3 cents a bushel, Wheeling for several years has expended from 50 to 70 cents per 1000 ft. yearly, according to the amount spent on extensions. The original cost of this, as of all the other old plants, has been paid for out of net earnings.

The next city to undertake the municipal ownership, Bellefontaine, O., has had a successful history, free from any grave abuses. The oil gas-plant, tho only three or four years old, is not proving economical, but permits of delivery to the consumer at a cost of 60 to 80 cents, according to the amount spent on extensions. The price is now a little under \$1. In all statements of cost in this article interest is not included, because most of the plants have no debt, and so need not earn interest. Neither is allowance made for depreciation, since in most cases the extensions, which are here included in general expenses, usually equal or exceed the depreciation. The average taxes of the private gas companies in Massachusetts in 1895 were 6 cents per 1000 ft. sold.

Danville, Va., has one of the best-managed coal-gas plants of its size one can easily find. Since March, 1894, the price of gas has been \$1. In 1895, the cost of gas delivered in the burner, with coal over \$4.25 a ton, was 68.6 cents, or, including extensions and improvements, 85.7 cents.

Charlottesville, Va., has another equally well-managed plant, where the cost in 1895, when there were no extensions, was 59.4 cents. Coal costs \$3.75 a ton.

Hamilton, O., has an excellent coal-gas plant, to which it added in 1893 an oil-gas plant. In view of the rise in the price of oil and the character of this particular oil-gas plant, its introduction has proven somewhat of a mistake. A water-gas plant would have been better as a supplement to the coal-gas plant. The works appear to be well managed, and in 1895, with coal at \$2.85, oil at 2.4 cents a gallon, and coke at 6 cents a bushel, put gas in the burner for 61.5 cents, aside from 10.3 cents for extensions. Altho the price will apparently have to be \$1, if it is proposed to cover interest on the large part of the plant still unpaid for, the price was reduced to 80 cents in November, 1895. The people were paying \$2 to a private company prior to the construction of the city's plant in 1890. As the old company refused to sell, the city erected its own plant, after a fierce opposition in the courts, and now enjoys the larger portion of the people's patronage.

In Fredericksburg, Va., the people were paying \$3 per 1000 ft. in 1891 to a private company. In 1895 the price of the public-made coal gas was \$1.50, and the cost 70 cents, besides 60 cents for extensions and improvements.

Repeated visits to these 10 gas-owning cities lead to several conclusions—*viz.* :

1. The satisfaction of the people with city ownership, despite certain weaknesses which are being gradually removed.

2. The low price of public-made as compared with private-made gas of similar quality in cities of the State or vicinity similarly situated as respects cost of materials, population, etc.

3. The cost of constructing first-class gas-works to-day varies from \$3 to \$6 per 1000 ft. of yearly output, according to the magnitude and density of the population, the difficulty of laying mains, etc. The capitalization of private gas companies, however, on which good dividends and interest are paid, is frequently from \$6 to \$12 per 1000 ft., and is often largest in the largest cities, where it should be lowest.

4. When cities own their gas-works a larger proportion of the population use gas than when the works are owned by private companies. In 1890, when we have exact figures of population, the average percentage of gas consumers of the total population in the nine cities then owning their gas-works was 7.1, while in the 10 Massachusetts cities where the net price was under \$1.60, the percentage was only 5.64. Yet the average price in these Massachusetts cities, because of their larger size and other conditions, was about the same as in the public-owned cities. This same greater popularity of public ownership among consumers has been conclusively proven in the case of water.

5. Another conclusion is, that while Philadel-

phia, Wheeling, Alexandria, and possibly one or two others of the 12 gas-owning cities, are not as progressive or free from political abuses as they should be, **Development.** yet the gas-works even here are as well managed as the streets or other public works, and more advantageous to the people in the matter of price or net revenue, and usually both, than the private-owned street railways in those cities or the gas works in neighboring cities. A still greater superiority of public ownership is likely when tried in such States as Massachusetts, where efficient city government in all directions is more common.

In the history of even the cities now owning their gas works, few changes of superintendents are recorded. These cities have realized far more than generally supposed that it would not do to change skilled engineers every time politics change. Superintendent William Cannings held his office at Henderson, Ky., from the beginning of direct city operation in 1882 until his death in 1894. In 1891, the Superintendent of the Alexandria, Va., gas-works died after 30 years of service. Superintendent W. C. Adams, of Richmond, Va., held his office from 1886 until his death in 1895, and for 16 years before that had been assistant superintendent. At Wheeling, Mr. S. M. Darrah had charge from 1884 to 1896, except from 1886 to 1888, when the former superintendent was temporarily restored. Captain C. A. Ballou has been city engineer and chief of the Danville, Va., gas-works for 21 years; and in Charlottesville, Va., Superintendent J. T. Williams has had charge since the city bought the works in 1876. The chief engineer and real head of the Philadelphia gas department has held his place about 30 years, altho formerly much more handicapped in the choice of efficient non-partisan subordinates than at present.

EDWARD W. BEMIS.

For European conditions, see BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS. See also MUNICIPALISM.

References: *Municipal Ownership of Gas in the United States*, by Edward W. Bemis, in publications of American Economic Association, vol. vi., Nos. 4 and 5 (Macmillan & Co.); *Review of Reviews*, February, 1893, article by Bemis, *Recent Results of Municipal Gas Making in the United States*; Annual printed Reports of the Philadelphia, Richmond, and Danville plants; *Light, Heat, and Power*, July, 1894 (Philadelphia); article by W. W. Goodwin, *Some Reasons Why Philadelphia Should Retain Its Gas-Works*.

GEORGE, HENRY, was born in Philadelphia in 1839. He began business life as an office boy, but later went to sea and visited every part of the globe. Returning to Philadelphia as a printer, he soon went to sea again, but finally went to California and became compositor, reporter, then a successful journalist. In 1871 he joined with two others in founding the *San Francisco Post*; but his mind was now occupied with the social problem of the distribution of wealth. His first economic publication was *Our Land and Land Policy* (1871). Four years later he retired from editorial work, but he continued to write for the newspapers. His principal work, *Progress and Poverty*

(commenced in 1877 and finished in 1879), attracted attention immediately upon its publication, and still more when republished in Europe. It has been translated into several languages, and has been discussed by political economists and social philosophers of all schools. Its main doctrine is that "nothing short of making land common property can permanently relieve poverty and check the tendency of wages to the starvation point," and that the best, easiest, and quickest way to make land common is not to do it technically, but leaving all land titles in individual ownership, to tax the land ultimately to its full annual rental value; thus without revolutionary methods gradually appropriating to society for the good of all the full rental value of the soil. This, Mr. George believes, could be and should be a single tax (*q.v.*).

In 1880 the agitation of the land question in Ireland led him to publish a book on *The Irish Land Question*, embodying his views, and in 1881 Mr. George went to Ireland as a newspaper correspondent to examine the actual condition of the peasantry, and was imprisoned for a time as a suspect, but afterward released with ample apologies. The Irish Nationalists, however, as a class did not embrace his ideas, and in 1883 Mr. George visited England and lectured in the principal cities, advocating the theory advanced in his book and eliciting universal attention.

Returning to this country, Mr. George found his influence very much increased and his ideas widely spreading, particularly in New York City. In 1886 he was nominated Mayor of New York City by the United Labor Party, and after a campaign of intense popular excitement he received the phenomenal vote of 68,110 ballots, being only defeated by the Democratic candidate. In this municipal campaign Mr. George had been enthusiastically supported by the New York socialists; but when, in the State Convention at Albany of the United Labor Party, which nominated him for governor in 1887, Mr. George saw fit to declare distinctly against socialism and for a single tax, based largely on individualistic ideas, the socialists opposed him, and have ever since denounced him. Meanwhile, the educational movement had been going on; but in the State election Mr. George polled but a small vote. At the beginning of the year he had started a weekly organ, the *Standard*, which attained a large circulation; and the coming out for his ideas of Father McGlynn (*q.v.*), a popular Roman Catholic priest of a large New York City parish, in spite of the opposition of the archbishop, created great excitement, and a religious society was organized to develop the religious side of the question, called the Anti-Poverty Society (*q.v.*). Meanwhile, Mr. George lectured to immense audiences all over this country and in Canada, England, Scotland, and Australia, while his ideas penetrated Germany and France. Mr. George, however, came to feel more and more that to put his ideas into practical execution, the first thing necessary was to clear the ground by repealing other taxes, and, first of all, what he regarded as the great imposition of the tariff. He wrote, therefore, his book on *Free Trade*, one of his

ablest efforts, and worked henceforth with the Democratic Party, in the hope of inducing them eventually, if not at first, to stand for absolute free trade. Many have felt that his ideas should be realized in connection with socialistic and nationalistic ideas rather than individualistic, and while not renouncing his ideas, he should have gone over to the growing People's Party and nationalistic movement in this country. The *Standard* was given up by Mr. George in 1890. Since then he has lived in comparative retirement, writing articles, notably *The Condition of Labor*, a letter to the Pope on the occasion of the papal encyclical, and making occasional addresses.

GERMANY AND SOCIAL REFORM.

I. STATISTICS.

The German Empire, according to its Constitution of April 16, 1871, is a confederation of German States (see FEDERATION) under an Emperor who has the direction of political and military affairs, and can declare defensive war. The legislative power is vested in the Bundesrath of 58 delegates, appointed by the States, Prussia having 17; Bavaria, 6; Württemberg and Saxony, 4 each, and the Reichstag. This latter body has 397 members elected for five years by universal suffrage (see FRANCHISE, ELECTORAL); 236 represent Prussia, 48 Bavaria, 23 Saxony. The Emperor has no vote. The population and area of Germany in 1895 was 51,758,364 in 208,670 square miles.

STATES.	Sq. Miles.	Population.	Population per Sq. Mile.
The Empire	208,670	51,758,364	236.7
Prussia	134,463	31,491,209	222.8
Bavaria	29,282	5,773,836	191.1
Württemberg	7,528	2,071,407	270.5
Baden	5,821	1,713,844	289.8
Saxony	5,787	3,753,372	605.2

In 1882 the division by occupations was as follows:

Agriculture	13,840,818
Industry	16,058,080
Commerce	4,531,080
Professions	2,222,982
Domestic and other service	928,294
Forestry, fishing, etc.	384,637
With no occupation	2,246,222

The births steadily exceed the deaths, and the population grows in spite of a large emigration. The cities have grown with great rapidity. (See CITIES.)

Military service drives many young men from the empire, while the support of the army is a crushing load. (See ARMY.) The peace footing of the army is 22,618 officers and 562,116 men; the war footing, including the *landsturm* and one-year volunteers, is about 3,500,000. The budget for 1896 is:

REVENUE.	
Customs and excise	\$156,750,850
Stamps	13,657,250
Post and telegraph	7,444,720
Printing-office	368,550
Railways	5,793,250
Imperial bank	1,795,525
Department receipts	2,987,625
Interest of invalid fund	6,598,425
" imperial fund	2,500
Various	200,000
Extraordinary	11,594,650
Federal contributions	99,000,025

\$306,193,375

EXPENDITURES.

Imperial army	\$118,053,100
" navy	13,815,375
" treasury	94,727,500
Pension fund	18,491,825
Reichstag	13,758,700
Chancery	162,750
Foreign office	38,450
Home office	2,039,125
Justice	7,434,400
Railways	521,350
Auditing	86,725
Invalid fund	183,875
Reform of Civil Service	6,598,425
Extraordinary	12,475

II. SOCIAL REFORM.

Social reform in Germany, as elsewhere, is affected by the past. Germany was too full of the spirit of local freedom to develop a centralized government, as in France or England. It developed separate kingdoms and States, only loosely federated into an empire, coming down from Charlemagne. Its great free cities developed art and education. Germany led in the battles of the emperors against the Pope and in the Protestant Reformation. She became the home of theology, philosophy, science, and letters. Her peasantry developed the Peasants' War (*q.v.*), and also the mystic communism (*q.v.*) which has given America her many German communities. The old Germanic empire extended from 800-1806, when it was destroyed by Napoleon. Its place was taken by the Confederation of the Rhine, and in 1866 by the North German Federation.

Modern German social reform began with Hegel's socialistic philosophy and Fichte's socialistic turning of an individualistic philosophy. (See FICHTE and HEGEL.)

This, too, was in accord with the German medieval conception of the Christian paternal state. (See BISMARCK.)

Nevertheless, in the early part of the nineteenth century, German statesmen and economists drew their ideas mainly from England and the orthodox economy of Adam Smith. Particularly was this true of the Stein-Hardenberg legislation of Prussia. Germany more than most countries of Europe, perhaps because of the lack of a strong centralized power to break the power of the old guilds and free cities, was in the control of innumerable special privileges, rights, and monopolies, granted to the old guilds and cities. This mass of special privileges and imposts had to be done away with. There were, however, some early voices for socialism. (See GALL; ROBERTUS, etc.)

Individualism.

Such was the condition of things when the revolutions of 1848 awoke Europe. In Prussia, the demand in 1848 was for constitutional government, freedom of religion and of the press, the right of coalition, etc., with demands here and there by the prolétariat for the organization of labor, State employment of the unemployed, etc. In Berlin, blood was shed. The king, Frederick William IV., promised reforms and the reorganization of Germany. The National Assembly was called at Frankfurt, where Bismarck won his first laurels in gaining the leadership for Prussia.

The only industrial organizations effected immediately after the revolution were various clubs, mainly under the patronage of the Liberal Party, and the cooperative land banks and societies, organized by Schulze-Dechwitzsch. In Berlin, however, Lassalle's utterances were growing more radical; and on April 12, 1862—sometimes called the birthday of German socialism—being invited to lecture before a working man's club, he argued that the Revolution of 1848 had politically freed the fourth estate, even as the French Revolution freed the third estate, and that henceforth working men must organize for industrial freedom. He was arrested and sentenced to imprisonment, which was later commuted to a fine. A central committee of working men's clubs in Leipzig now wrote Lassalle calling on him to outline a policy; and he did so in an open letter, which has been called the charter of German socialism.

Encouraged by these successes, Lassalle now organized at Leipzig, on May 23, 1863, the Universal German Working Man's Association, which was destined to grow into the Social Democratic Party. Lassalle's program was one of industrial organization for production with State help. Into this movement Lassalle now put all his energy. The apathy of the working men was his chief obstacle. He made speech after speech, wrote tract after tract, held meeting after meeting. All the time he was fighting the courts in trial after trial, defending himself, and usually winning. Berlin, Leipsic, Frankfort, and the industrial centers on the Rhine were the chief scenes of his activity. His greatest success was on the Rhine, where, in the summers of 1863 and 1864, his travels as missionary of the new gospel resembled a triumphal procession. He claimed that he had converted the king, Bismarck, and the Bishop of Mayence.

But Lassalle had now reached the height of his career. He went to Switzerland for rest, and there made the love acquaintance which, through a duel, resulted in his death, August 31, 1864. But his death worked for socialism. The people called him the "father of social democracy."

Meanwhile, in London, at the end of September, 1864, the famous International Working Men's Association was established and Marx was made its president. With the principles of this organization Liebknecht, who had already joined Lassalle's association, and who in time won August Bebel over to his side, was in complete sympathy; and though he continued to profess allegiance to the more moderate proposals of the German association, he was known to be promoting the influence of the International.

Bebel, originally a follower of Schulze-Dechwitzsch, and president of a working men's association at Leipsic, became, in the autumn of 1867, president of the Union of Working Men's Associations; and the following year, at the annual congress, was instrumental with Liebknecht in inducing a large majority of the associations to accept the program of the International.

In 1869 the Social Democratic Working Men's

Party was formed at Eisenach, out of the "internationalized" Union of Working Men's Associations and the seceded members of the Universal. In 1870 Liebknecht and Bebel and Hepner were arrested for the publication of treasonable writings.

In 1874, however, 10 members of the Social Democratic Party were returned to the Reichstag by 450,000 votes. Bebel and Liebknecht were still in prison, but they were nevertheless elected. Socialism was now becoming such a power in the State that the Government determined to be more stringent. House searches were made in great number, and the Working Men's Association was declared by the police to be dissolved in Prussia. The Social Democratic Working Men's Party shared the same fate. Misfortune brought the two rival parties together, and a congress held at Gotha in May, 1875, completed the union. The program then adopted became the basis of the great agitation which followed in all parts of Germany.

On May 11, 1878, the emperor was shot at in Berlin by a young man called Hödel, an ignorant man of low character. He was declared to be a socialist because photographs of socialists were found in his pocket. Immediately an anti-socialist bill was introduced into the Reichstag, which that body, however, refused to pass. Another attempt was made upon the life of the aged sovereign. This time the would-be assassin was a Dr. Karl Nobiling, who, on June 2, 1878, fired at the emperor from an upper window in the Linden and severely wounded him. The cry for repressive measures against the socialists now became general.

Another law was now proposed—the "Law against the publicly dangerous endeavors of social democracy." The bill as approved gave to the executive and the police very extensive powers. It became law October 19—after Liebknecht had declared that it could "neither be made better nor worse," and the Progressist leader, Richter, had said, "I fear social democracy more under this law than without it." The division showed 221 members to be in favor of the measure and 149 against it.

The law prohibited the formation or existence of organizations which seek by social democratic, socialistic, or communistic movements to subvert the present State and society.

Henceforth the socialistic propaganda was carried on in secret, but more successfully than ever; and in the Reichstag the socialists were free. Here, at any rate, the pursued socialist knew that he could claim the right of sanctuary. The publication of parliamentary reports being privileged, journals with socialistic tendencies were able to reproduce in full the speeches in which Bebel, Liebknecht, and their fellows preached the principles of a movement which the Government had just been given a commission to suppress.

There was only one way of meeting this new danger, and it was by voting to suppress the publicity of proceedings. This Bismarck attempted twice, but each time was defeated.

On the other hand, an event occurred in 1881 which roused the authorities to increased vigi-

lance. This was the Niederwald plot against the imperial family, the existence of which was discovered in September. Various arrests were made, and the trial took place at Leipsic, two men, avowedly anarchists, being in December, 1884, sentenced to death. In the early part of this latter year the socialist law was prolonged for two years.

In 1884 another general election took place, and it afforded the Socialist Party an opportunity of demonstrating its strength. In Berlin two out of the six places fell to socialists, and in Hamburg and Breslau two out of three. The number of votes polled was 549,990.

Repression was made more vigorous than ever. The year 1889 was marked by the largest strike Germany had ever known, which took place in the coal mines of Westphalia and the Rhenish provinces, and threatened to spread, and did spread, more or less through the empire, the emperor himself taking an interest in hearing the complaints of the miners and ordering an investigation. The strike ended in the substantial victory of the men, altho to some extent they compromised.

On March 20, 1890, the emperor accepted the resignation of Bismarck as chancellor, largely upon Bismarck's insistence that the Anti-Socialist Law must be renewed, a step which the young emperor did not

Socialistic Gains. favor; and on its expiration (September 30, 1890) it was not renewed.

The socialists came back in great numbers amid general rejoicing. Herr Liebknecht assumed the editorship of the *Volksblatt*, and activity went on more rapidly than ever, especially in Berlin, Hamburg, and the great industrial centers, and not least in the army, where young men, restless under conscription, are gathered from all Germany, and ready, therefore, under the galling yoke of the army service, which is so hated by the working class, to listen to socialism. The conflict of the year 1893 over the Standing Army Bill is well known, with its result of the stupendous socialistic gains. The following table shows the growth of the Social Democratic Party since the founding of the German Empire, as shown in the imperial election returns, taken from Braun's *Die Parteien des Deutschen Reichstages*, Stuttgart, 1893:

ELECTION IN	Total Number of Social Democratic Votes.	Percentage of Votes of Social Democratic Party.	Members Elected.	Votes Cast for Each Member.
1871.....	124,655	3	2	62,327
1874.....	357,952	6.8	9	39,106
1877.....	493,288	9.1	12	41,107
1878.....	437,158	7.6	9	48,573
1881.....	311,961	6.1	12	25,997
1884.....	549,990	9.7	24	22,916
1887.....	763,128	10.1	11	69,375
1890.....	1,427,298	19.7	35*	40,780
1893.....	1,876,738	23.3	44	40,608

* In the bye-election in a district of Saxony, held in 1892, the thirty-sixth member was elected.

The party is strongly organized, and carries on a most active propaganda, publishing 31 daily newspapers, 41 weeklies and semi-weeklies, one scientific review, one family magazine, two humorous publications, 55 trade journals.

At present it is making strong efforts to extend itself in the agricultural districts. It has organized night schools for the education and training of socialist speakers. It has many adherents among the university students.

Such is the account of German democratic socialism; but there have been in Germany four other separate movements, all using the name socialism. The earliest of these is the Roman Catholic German Christian Socialist movement, mainly led by Bishop von Ketteler in Mayence about 1850, and still a political and social force in the empire.

Christian Socialism.

It often allies itself politically with the Social Democrats, but proceeds on wholly different lines. German social democracy is avowedly atheistic and materialistic, and will have naught to do with the Church. The Roman Catholic movement favors a paternal State socialism under churchly guidance. This is even more true of the German Protestant Christian socialism which sprang up under Stöcker, the court preacher in Berlin about 1877. It organized two societies, one to reach the wealthy and one the working men, and was almost explicitly the Church wing of the Government's paternal State socialism. (See CHRISTIAN SOCIALISM.)

The third movement in Germany using the name socialism is that of the so-called Socialists of the Chair (*Kathedersozialisten*), a movement commencing with a gathering at Eisenach in 1872 under the lead of such men as Schnoller, Wagner, and others. A *Verein für Sozialpolitik* was formed to represent its ideas, which may be said to be the modification but not abolition of individualism by a paternal State socialism.

The fourth movement which uses the name of socialism in Germany is the State socialism of the Government itself.

As early as 1847 Bismarck had spoken in favor of State railroads; but he did not definitely, or at least publicly, adopt the principles of State socialism till 1878, after the policy of repression of the democratic socialists had begun. He then endeavored with the one hand to repress and with the other to take the ground from under them. His first step, however, was simply to reverse the economic policy of the State on the subject of taxation and establish protection. His next step was to try and introduce various State monopolies, such as a tobacco monopoly. He did not succeed in getting these efforts supported by the Reichstag; but most German railroads are today State roads. (See RAILROADS.)

State Socialism.

But thus far the high-water tide of imperial State socialism has been reached in the various State insurance laws. In 1881 came the first decided word from the emperor and his government upon the subject. The Sickness Insurance Law was passed in 1883, the Accident Insurance Law in 1884, and the Old Age Law in 1889. (See INSURANCE.)

Such are the main present developments of the imperial State socialism ; but a word should be said of German municipalism, which belongs to the same paternal and therefore unsocialistic school.

Says Dr. Albert Shaw (*Century*, July, 1894) : " The German city holds itself responsible for the education of all ; for the provision of amusement, and the means of recreation ; for the adaptation of the training of the young to the necessities of gaining a livelihood ; for the health of families ; for the moral interests of all ; for the civilizing of the people ; for the promotion of individual thrift ; for protection from various misfortunes ; for the development of advantages and opportunities in order to promote the industrial and commercial well-being ; and incidentally for the supply of common services and the introduction of conveniences. The methods it employs to gain its ends are sometimes those advocated by the socialists, and sometimes they are diametrically opposite."

According to Dr. Shaw, about two thirds of the larger German cities own and operate their own gas-works, and are going in to provide municipal electric light and power. All German cities care for their own cleaning and sanitation to an extent far beyond that of most other countries. Their systems for providing good housing are growing rapidly more perfect. The cities provide pawnbrokerage and savings banks. Especially admirable is the extent to which they plan far ahead for, and steadily carry out, municipal improvements.

The German police strictly control all life. In some German cities there are police regulations as to how one shall carry his umbrella so as not to hit passers in the street. Germany seems at times under military control.

It should be stated that the Social Democrats repudiate this State socialism, and vote, for instance, against compulsory insurance.

Bebel (*Die Frau und Sozialismus*, pp. 312-14) argues that under socialism, ministers, parliaments, armies, police, courts, attorneys, taxation, will all disappear, their place being taken by administrative colleges or boards.

Side by side with this socialist development has gone an individualist agitation for voluntary guilds of employers and employees together, and for cooperative and religious societies. The old medieval guilds were divested of their exclusive character under Frederick William I., and since then the tendency, as far as the Government is concerned, has been toward industrial freedom. Various laws, however, have been passed to aid these voluntary guilds. About 1845 various congresses of employees voted for the establishment of compulsory guilds limiting employers, and especially employees. A commission to investigate the subject was appointed, and district councils of industry were established but did not succeed. Still, 10,223 guilds have been formed in the empire under Government supervision, and are occasionally given power to enforce arbitration. Trade-unions, apart from the socialist movement, have also been somewhat developed. The German tobacco workers organized in 1865, and the printers in 1866. In 1893 there were 1341 unions with 61,034 members, the engineers

and metal-workers having 403 unions ; factory workers and manual laborers, 229 ; cabinet-makers, 113 ; shoemakers, 108. These unions are largely the result of the activity of Dr. Hirsch, editor of the *Trade-Union*, who stands midway between the Government's State socialism and the Social Democrats. The printers' union of Germany is not connected with this movement. It can be traced back to the seventh-century guilds, and has followed much more closely than any other union in Germany the English trade-unions. In 1891-92 there was a prolonged strike for a nine-hour day, attended with some success. In 1890 it had a capital of \$426,769.

Most of the trade-unions, however, are connected with socialism. They numbered, in 1892, 244,934. Of these, 44,000 were miners, 26,000 metal-workers, 18,000 cabinet-makers, 16,000 printers, 11,000 tobacco-workers. Besides these **Trade-Unions.** different classes of unions, the Roman Catholic unions have about 75,000 members and the Protestant unions 76,000, mainly educational. Cooperation in Germany commences with the efforts of Huber and his paper, *Janus*, in 1836, and, above all, the work of Schulze Delitzsch, dating from 1844, has had considerable success in Germany, especially on the line of credit banks. (See COOPERATION ; COOPERATIVE BANKS.) Strikes have not been large in Germany, the largest being among the miners. Arbitration, perhaps, as a result, has not had much development. (See ARBITRATION.) On the other hand, Government has done a good deal by its insurance schemes, and less by its factory legislation.

On March 15, 1890, a labor conference of representatives of the various powers met in Berlin by the invitation of the young emperor, and sat two weeks. The invitation was liberally responded to ; but the scope of the deliberations was practically narrowed down to the question of **Other Movements.** Sunday, female, and juvenile work.

In 1891 a bill was passed in the Reichstag to go into force April 1, 1892, embodying the main results of the conference : 24 hours' rest on Sunday, except in specified industries, like hotels, etc. ; 48 hours' rest on church festivals, such as Christmas, Easter, and Whitsunday ; women not to work over 11 hours, nor to do any night work, nor for so many weeks after childbirth ; children under 13 not to be employed, and not after that unless they have had the legal time in school.

Poor law administration in Germany has been developed on large lines and in characteristic ways. (See ELBERFELD SYSTEM ; LABOR COLONIES.)

GERRYMANDERING.—In United States politics, an arrangement of the political divisions of a State in disregard of natural boundaries, as indicated by geography or position, so as to give one party an unfair political advantage. This is done sometimes by throwing the

greatest possible number of hostile voters into a district which is certain to be hostile, sometimes by adding to a district where parties are equally divided some place in which the majority of friendly voters is sufficient to turn the scale.

The aim of gerrymandering is so to lay out the districts as to secure in the greatest possible number of them a majority for the party which conducts the operation.

The word is derived from Elbridge Gerry, a leading Democratic politician in Massachusetts (a member of the Constitutional Convention of 1787, and in 1812 elected Vice-President of the United States), who, when Massachusetts was being re-districted, contrived a scheme which gave one of the districts a shape like that of a lizard. A noted artist entering the room of an editor who had a map of the new districts hanging on the wall over his desk observed, "Why, this district looks like a salamander," and put in the claws and eyes of the creature with his pencil. "Say rather a Gerrymander," replied the editor; and the name remained.

GIDDINGS, FRANKLIN HENRY, was born at Sherman, Conn., in 1855. After preparatory studies at Great Barrington he entered Union College in 1873, and received the degrees of A.B. and A.M. Entering journalism, he was connected with the *Daily Union and Republican* of Springfield, Mass. In 1885 he made an investigation of cooperation and profit-sharing for the Massachusetts Bureau of Labor, the results being published in its seventh annual report. In 1888 he was appointed Resident Lecturer and in 1891 Associate Professor of Political Science at Bryn Mawr College. In 1891, without leaving Bryn Mawr, he was appointed Lecturer on Sociology in the School of Political Sciences at Columbia University, and in 1894 Professor of Sociology in that University, leaving Bryn Mawr. Professor Giddings has been Chairman of the Publication Committee of the American Economic Association, and Vice-President of the American Academy of Political and Social Science. His contributions to economic journals have been almost constant, and since 1891 mainly concerned with the province and contents of sociology, in which department Professor Giddings has come to be an acknowledged leader, his studies culminating thus far in his *The Theory of Sociology* (1896), at present the latest and most complete treatise on the subject.

GIDE, CHARLES, was born in 1847 at Uzès, France. From 1874-80 Professor of Jurisprudence at Bordeaux, he has been since 1880 Professor of Political Economy at Montpellier. His chief work is his *Principes d'Economie Politique* (1883), which has been translated into English. He is even better known by his valuable reviews and magazine articles as one of the leaders in the revolt against the classic French economists, and also for his active interest in the French Protestant movement toward Christian Socialism (*q.v.*).

GIFFIN, ROBERT, was born at Strathaven, Lancashire, in 1837, and educated in its parish school. He was a solicitor's clerk at Strathaven

and Glasgow, and from 1856-58 attended Glasgow College. He then entered a commercial house in Glasgow, but in 1860 entered journalism, being connected with the *Stirling Journal*, the *Globe*, and for a short time the *Fortnightly Review*. From 1868-76 he was assistant editor of the *Economist*, and from 1870-76 edited the trade and finance articles of the *Daily News*. In 1876 he was appointed chief of the Statistical Department of the Board of Trade. He has written numerous reports and magazine articles.

GILMAN, NICHOLAS PAINE, whose name is so prominently identified with the subject of profit-sharing, was born December 21, 1849, in Quincy, Ill. His early education was obtained in the public schools and academies of Maine and New Hampshire, and at the Harvard Divinity School, from which he was graduated in 1871. From 1872-84, with the exception of 1878-81, when he was professor in Antioch College, he was pastor of Unitarian churches in Scituate, Bolton, and Wayland, Mass. Mr. Gilman was associate editor of the *Unitarian Review* of Boston, 1885-90, and has been editor of the *Literary World* of Boston from 1888-96. When the *New World* was established in Boston, March, 1892, Mr. Gilman became its editor, and, at the founding of the Association for the Promotion of Profit-Sharing, he was chosen secretary and made editor of the *Employer and Employed*, the organ of the association. In 1896 he became Professor of Sociology in Meadville Theological Seminary, at Meadville, Pa. Besides articles on religious, theological, and social subjects published since 1877, he has written *Profit-Sharing between Employer and Employed* (1889), *The Law of Daily Conduct* (1891), *Socialism and the American Spirit* (1893).

GIOJA, MELCHIORRE, was born in Piacenza, Italy, in 1767. Receiving priest's orders, he welcomed the entry of the French into Italy, and argued for the establishment of an Italian republic. Made State historian, he lost this position by a work he wrote on divorce (1803), and placed in charge of the Italian statistics, he lost this by his criticism of State officials. He was in prison for eight months in 1820 on a charge of conspiring with the Carbonari. In spite of this eventful life, he was, till his death in 1829, among the foremost Italian economists of his day, a leader in statistical science, and a critical student of all economical schools. He largely favored State interference. Among his works are *Nuove prospettive delle scienze economiche* (6 vols., 1815-19) and *Filosofia della statistica* (2 vols., 1826).

GLASGOW is considered by Mr. Albert Shaw, in his *Municipal Government in Great Britain* (p. 169), to be the leader in Great Britain of that new régime of municipal socialism which is so marked a characteristic of the present day. It is to his study of Glasgow contained in the above-named book that we are mainly indebted for the following facts:

Glasgow claims for itself the second place in the British Empire. It has grown in population

with great rapidity from about 75,000 in 1800 to some 800,000 in 1895, in a compact space of 15,000 acres. This dense population, together with the nature of the inhabitants—a working class living in crowded tenements—has made its municipal problems of the utmost gravity. London in 1881 had a population of 51 to the acre; Glasgow in 1891 had 92 to the acre, and in five districts 300 to the acre.

At first a bishop's seat, Glasgow became wholly self-governing only in 1690. In 1833 the Scotch Reform Act made her municipal franchise the same as the parliamentary, and the act of 1868 enfranchised many more. Her municipal voting roll in 1891 included 94,186 names (15,448 women). The franchise depending on rate-paying, the poorer classes and the floating population dodge the rates and lose their vote.

The municipal government consists of a council of 78 members, three members being elected from each of the 25 wards, one retiring each year, and the remaining members being the Lord Provost, or Mayor, **Constitution.** and two other *ex-officio* members. The provost is elected by the council from its own number. He presides and personifies the dignity of the city, but has little or no executive power. He is elected for three years, like the bailies, and, like them, is a magistrate. The bailies sit as citizen magistrates in certain districts. The whole executive power is in the hands of the council, which works through committees and makes all appointments. The town clerk and chamberlain preserve the records, statistics, etc., and are men of high authority and learning. No salaries are attached to the offices of councillors.

The municipalism of Glasgow is developed on many lines. Its sanitary department is most efficient. Magnificent hospitals have been erected. Food, milk, and, above all, lodging-houses and tenements, are carefully inspected and controlled. (For the fine bath-house and wash-house system of Glasgow, see **BATH-HOUSES**.) The streets and also the tenement courts are cleaned every day. Manure and refuse collected by the city is sold (in 1893, 276,000 tons, from 25 to 50 cents a ton). Refuse is also used on two successful municipal farms.

The city lights not only the streets **Sanitation.** but the courts and common staircases, spending more for these than she does for the streets. The worst slums have been torn down and streets widened and improved, a part laid out by the council acting as an "improvement trust" (commencing in 1866). The city has bought large tracts of land, and is gradually tearing down the tenements upon this land and building improved dwellings, which it rents at \$100,000 a year, largely paying the interest charge on the whole property, which it is holding for sale. Glasgow having had particularly bad lodging-houses, the city, by 1879, built and still maintains seven municipal lodging-houses, with 2000 beds, which are an unqualified success. They have wiped out the worst private houses, and yield a revenue to the city. As a result of these and other improvements, the condition of the tenement population is improved. In 1871, 30.4 per cent. of Glasgow's population lived in tenements of

one room; in 1881, 24.7 per cent.; in 1891, only 18 per cent. Those living in two rooms, however, have increased. In 1891, 47.5 per cent. lived in two rooms; only 8 per cent. in houses of five or more rooms. Until 1860 Glasgow had its water supplied by a private corporation at a rate of 14 pence in the pound. To-day, under municipal management, water is brought in abundant quantities from lochs in the Highlands at 7d., **Natural Monopolies.** and still gets a net revenue of \$200,000. Up to 1895 the city had spent \$14,000,000 on its water supply, and expects to spend \$6,000,000 without increasing charges or taxes by a penny. In 1869 the city bought its gas-works from a private company; it has reduced the price from the \$1.14 charged by the company to 60 cents, tho the price of making coal gas has risen. The original cost was \$2,600,000, and improvements created a debt in 1875 of \$5,300,000. To-day it is \$2,400,000, much more than covered by the value of the plant. The city sells gas at very cheap rates for fuel in the tenements, and in 1892 had rented 8000 gas stoves, besides selling many thousands—a great convenience in the crowded tenements. In 1892 the city bought out the company conducting electric light, and has made a success of this. In 1894 Glasgow bought out the private horse railway system. She allowed an elaborate system of omnibuses to compete with her. Yet after raising the wages of the employees, limiting their hours, establishing a sick and death insurance, adding clean and good cars, increasing the service, refusing street-car advertisements, the city has lowered the fares, a large proportion of which has been one-cent fares, and yet made, in 1895, a gross profit of \$121,025.

Glasgow's greatest municipal activity, however, has been her improvement of the Clyde, which has made Glasgow what she is. In 1750 the Clyde was fordable. To day the greatest ship-yards of the world line the river. The city supplies **Results.** ships with water, owns and provides docks, ferries, harbor steamers, and thus receives a revenue of from \$1,750,000 to \$2,000,000 per year, an interest on improvements only recently approximating \$100,000,000, so that when that sum has been reached the direct revenue will be a larger percentage on the expenditure, to say nothing of the indirect revenue from the creation of the city. Besides these activities are municipal buildings, markets, slaughter-houses, sewerage systems, public schools, parks, art galleries, libraries, playgrounds. Its debt is not large, and potentially covered by the growing sinking funds of prosperous and productive departments.

Reference: Albert Shaw's *Municipal Government in Great Britain*.

GOBLET, RENÉ MARIE, was born at Aire in 1828. He entered the legal profession, then journalism, and, later, politics. In 1870 he was Procureur-Général at Amiens; in 1871 representative for La Somme, being a Republican of the Left, and though at first a supporter of the Government, he gradually became more and more independent. From January to August.

1882, he held the portfolio of the Interior in the Freycinet Cabinet; from April, 1885, to December, 1886, the portfolio of Public Instruction and of the Arts, under Brisson. From 1886-87 he was President of the Council; and from April, 1888, to April, 1889, Minister of Foreign Affairs. In the last general election he declared out and out for socialism, and is considered a leading socialist in French Government circles.

GODIN, JEAN BAPTISTE ANDRÉ, AND THE FAMILISTÈRE AT GUISE; was born, in 1817, at Esquehéries, of a family of artisans. Early engaging in industry, he, in 1847, moved his works to Guise, and became interested in cooperation as a disciple of Fourier. In 1859 he commenced his famous *Familistère*, or communal home, and rapidly developed it. In 1870 he was elected Mayor of Guise, and in 1871 representative for Aisne. In 1871 he also published his *Solutions Sociales*, or account of his *Familistère*. He fully established profit-sharing in 1876, and in 1886 he made the *Familistère de Guise* a cooperative society, associating in his firm 32 clerks or workmen. From 1876-88 the average sales were 3,935,600 frs., with a gross profit of 735,000 frs., which were distributed among the workmen, capital, the common fund, education, and the sinking fund. The *Familistère* is organized like a great family. It has its buildings for habitation, baking-house, steward's office, nursery, schools, pension bank, and insurance office. The *Familistère* in 1888 had 13 *associés*, 67 *sociétaires*, 52 *participants*, out of 1237 employees. The industry carried on is the making of stoves, ovens, and smaller hardware. There are three big buildings with 1800 inhabitants, each family having two or three rooms. Each building encloses an interior court, covered with a glass roof and paved with cement. The building is four stories high. The central parallelogram, or rectangle, is 211 ft. front and 130 ft. deep. The stores of the association on the lowest story of the central portion of the building contain whatever is necessary for ordinary need and comfort, without reference to luxuries. In the social palace 1500 persons can see each other go to their daily domestic occupations, reunite in public places, go to market or shopping, under covered galleries, without traversing more than 200 yards. Much attention is given to education. Babies can be left by their mothers in a *crèche* from 7 A.M. to 7 P.M. There is considerable social life. Godin died in 1888. The firm is now Dequenne et Compagnie, M. Dequenne being managing director for life.

GODWIN, MARY WOLLSTONECRAFT, was born at Hoxton, England, in 1759. Forced early to earn her own living, she became governess in the family of Lord Kingsborough, in Ireland. She soon resolved to devote herself altogether to literary work, and began to translate from the French. In 1792 appeared her best-known work, *A Vindication of the Rights of Woman*. Her book was mainly a plea for equality of education, for State education, and for the joint education of the sexes. It was a strong protest against the assumption that woman was only the plaything of

man; and she asserted that intellectual companionship was the chief and lasting happiness of marriage. She daringly dealt with dangerous questions, incidentally upheld greater freedom of divorce, and denied the eternity of the torments of hell. Having great sympathy with the ideas back of the French Revolution, she went to Paris, and remained there during the Reign of Terror. In 1797 she was married to William Godwin, and died in giving birth to a daughter, who became the wife of the poet Shelley.

GODWIN, WILLIAM, was born in 1756, at Wisbeach, in Cambridgeshire, at which place his father was a Nonconformist minister. Educated for his father's profession, he was at first more Calvinistic than his teachers, becoming a Sandemanian, of which sect he says that they were the followers of "a celebrated north-country apostle, who, after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin."

He officiated as a minister at Ware, Stowmarket, and Beaconsfield. At the second of these places the teachings of French Reformers were brought before him by a friend, and these, while they intensified his political, undermined his religious opinions. This finally led him to resign his charge. His only resource was to remove to the metropolis and engage in literature. His first work, a series of *Historical Sketches*, in the form of sermons, was unsuccessful, and he was reduced to penury and despair; but they made him acquainted with Fox, Sheridan, and other Whig leaders, and he turned his attention to politics. The American Revolution, closely followed by that of France, excited the public mind, and Godwin wrote his *Inquiry Concerning Political Justice* (1793). This was followed by *The Adventures of Caleb Williams*, a remarkable novel, intended to illustrate the political views advanced in the *Political Justice*.

In 1796, the intervening years having been spent in strenuous literary labor, Godwin married Mary Wollstonecraft. Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief. Mrs. Godwin died in giving birth to a daughter, afterward the second wife of Percy Bysshe Shelley. The cares of a family led him to contract a second marriage with Mrs. Clairmont in 1800.

To secure a more certain support, Godwin and his wife opened a circulating library, but he also worked indefatigably with his pen to the end of his life. He wrote many school books; an admirable *Life of Chaucer* (1801); *Fleetwood*, a novel (3 vols., 1805); *Mandeville* (1817); a *Treatise on Population*, a refutation of Malthus (1820); a *History of the Republic of England* (4 vols., 1824-28); *Cloudestley* (1830); *Thoughts on Man* (1833). As he grew old, he modified his opinions on politics and society, and especially on marriage, which he warmly commends in some of his later works. He was appointed to a place under Government; but he knew not how to be idle, and wrote *Delo-*

raine, a novel, and the *Lives of the Necromancers*. Many of his works were translated into foreign languages. He died in London, April 7, 1836.

In his own time, by his writings and by his conversation, Godwin had a great power of influencing men, and especially young men. He was an intense individualist, holding that all control of man by man was wrong, and that Government must disappear.

But all was to be done by discussion, and matured change resulting from discussion. His *Political Justice* almost created the English radicalism of the early part of the century, and led to the milder liberalism of to-day. In it he maintained that natural relationship had no claim on man, nor was gratitude to parents or benefactors any part of justice or virtue. Property was to belong to him who most wants it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and property the worst of all properties. His life was published in 1876 in two volumes, under the title *William Godwin, his Friends and Contemporaries*, by C. Kegan Paul. A part of his *Political Justice* has been recently brought out in the (English) Social Science Series.

GOLD AND SILVER, PRODUCTION OF.—We give in this article the facts as to the production of gold and of silver in the world and in the United States, and their relative commercial value. (For the explanation of the facts by the believers in the single gold standard, see **MONOMETALLISM**; for the explanation by believers in the double standard, see **SILVER**; for the coinage of gold and silver, see **CURRENCY**.)

I. GOLD.

The color, luster, and power of resisting oxidation possessed by gold have caused it to be considered a precious metal from the earliest times. Allusions to gold are frequent in the Jewish Scriptures and in classical writings. Jewelry and vessels found in Egyptian, Greek, and Trojan tombs show the perfection attained in working gold, while the value attached to it is shown by its being used in religious worship and in its being chosen by the poets to describe the glory of the gods.

The ancient supply of gold seems to have come from Eastern Africa, and around the sources of the Indus. In the times of the Romans, gold does not seem to have been so abundant, tho gold was worked near Apulia and in Spain. After the discovery of America it was brought in large quantities from Mexico, Brazil, and other South American countries. Between 1829 and 1838 it was found in Siberia and largely exported. The great gold fields of California were discovered in 1848, by accident by a Mr. Marshall, who found particles of gold dust in a mill race on the estate of a Captain Sutter. It led to intense excitement.

In February, 1851, the gold fields of Australia were discovered near Bathurst by a Mr. Hargraves, and this led to a series of discoveries. From 1851-94 the gold produced in Victoria is estimated at 59,446,235 oz., valued at £237,784,-

940. The gold fields of Queensland, discovered in 1858, are estimated to have yielded, to the end of 1894, 9,926,923 oz., valued at £37,744,230. The gold fields of New South Wales has produced, since 1851, 11,061,379 oz., valued at £41,010,669.

The most famous gold mines of Europe are those of Hungary and Transylvania, tho it has been found in Piedmont, Spain, and the British Islands.

The greater part of the gold of the world is obtained by washing from detrital deposits along the beds of rivers; a smaller quantity is obtained by crushing and washing quartz.

II. SILVER.

Silver, like gold, has been known and prized from the earliest ages. Phidon, King of Ægina, is said to have struck coins in silver B.C. 869. Silver currency was adopted by the Romans in 269. It was largely used by Greek and Roman artists. The silver mines of Mexico were, until quite recently, by far the richest known to exist. Until the remarkable discoveries of silver ore in Nevada and adjoining States in 1859 and 1860, Chile and Peru had long stood next to Mexico in their yield. Bolivia is also rich in silver.

Of European countries, Spain is the most productive. Next to Spain, Austria, Saxony, and the Harz district, in Northern Germany, yield the largest supplies. The silver mines of Königsberg, in Norway, are likewise valuable, and have been long famous.

The great silver-mining industry of the United States had no existence before 1860. The prospectors and pioneers who traversed Arizona, Idaho, Nevada, Colorado, and other Territories in the Far West, seeking for gold, in the years between 1850 and 1860, fell upon silver unexpectedly. The greatest silver mine ever known was discovered in this way in 1858-59, in the Washoe Country, on the eastern foothills of the Sierra Nevada. This was the celebrated "Comstock" mine, which was found by James Shinney and Henry Comstock, both of whom parted with their interest for a trifle, not discerning the value of the discovery. A portion of the mine was worked in 1860-61, and by 1865 it had yielded the value of \$30,000,000; and a city of 20,000 inhabitants was planted on its site. From 1859-66 the total product of the mines on the Comstock lode was about \$70,000,000. This discovery encouraged further prospecting. Idaho and Montana became silver bearing territory; and the Wasatch range, looking down into the Salt Lake valley, was found to be rich in silver-bearing lodes. Up to December, 1878, the value of the silver yield of Colorado was about \$16,000,000. Two years later the mines of Leadville, alone, not discovered till 1877, yielded as much.

III. STATISTICS.

The following table shows the world's production of gold and silver for 400 years, and compares their ratio of production with the ratio of their relative commercial value for the entire period. The figures giving production from 1493-1885 are from tables by Dr. Adolph Soetbeer, as given in the Report of the Director of the Mint for 1894, pages 304-305. The produc-

tion for the years from 1885-94 is given upon estimates of the Bureau of the Mint in the reports for 1893 and 1894. Recently published estimates of the production of gold and silver for 1894 have been added.

The two columns showing the amount of silver produced to one unit of gold in dollars and in ounces were prepared by Mr. George B. Waldron, from the world's production for each period as given in the preceding columns of the table.

For purposes of comparison he has added Dr. Soetbeer's estimates of the *commercial* ratio of gold to silver down to 1832, the estimates of Pixley and Abell from 1833-78, and those of the Director of the Mint from 1879-94. (See Report of the Director of the Mint for 1895.) Variations between the highest and lowest ratios of each period are given in the next column from 1687-1894, based on daily London quotations beginning with 1833.

WORLD'S PRODUCTION OF GOLD AND SILVER FOR 400 YEARS—COMPARISON BETWEEN RELATIVE AND COMMERCIAL VALUES OF THE TWO METALS.

CALENDAR YEARS.	WORLD'S PRODUCTION OF GOLD.		WORLD'S PRODUCTION OF SILVER.		SILVER PRODUCED TO ONE OF GOLD.		COMMERCIAL VALUE OF SILVER TO ONE OF GOLD.		Significant Historical Events.
	Fine Ounces.	Value.	Fine Ounces.	Value.	Dollars.	Ounces.	Average Ratio.	Variation between Highest and Lowest Ratio.	
1493-1520.	5,221,160	\$107,931,000	42,309,400	\$54,793,000	\$0.507	8.10	11.30	1492. Discovery of America.
1521-1540.	5,524,656	114,205,000	69,598,320	89,986,000	.788	12.60	11.20	1521. Cortez completes the conquest of Mexico.

1493-1894.	400,458,396	\$8,278,209,500	7,746,969,340	\$10,016,270,800	\$1.210	19.34	13.95	23.72	

The table is most important in its bearing on the silver question. The uniformity of the ratio down to 1873 is very marked. The lowest point in that period was touched in 1760, when it stood at 14.14 to 1 of gold, and the highest point in 1813, during the war with England, when it stood at 16.25. Since 1873 the ratio has rapidly risen until in March, 1894, it stood at nearly 35 to 1.

The commercial ratio of gold to silver, from the time of Herodotus (born 484 B.C.) down to the year 1717, is shown in the following from the letter of Lord Liverpool to the King of England (see *Coinage Laws of the United States*, 1894, p. 435):

In Persia, according to Herodotus..... 1 to 12½
 In Greece at same period..... 1 to 13
 In Greece in the time of Plato..... 1 to 12
 In Greece it is stated by Xenophon at..... 1 to 10
 After the plunder of gold from the Temple of Apollo, according to Menander, it was..... 1 to 10
 In the reign of Alexander the Great it was.... 1 to 10
 In Rome, according to Pliny the Elder... 1 to 10½
 In Rome, after the tribute from the Etruscans..... 1 to 10
 The plunder of gold from the Gauls by Julius Cæsar reduced the proportions to..... 1 to 7½
 In the reign of Claudius, Tacitus states it at. 1 to 12½
 Until the reign of Alexander Servius it contained..... 1 to 12½
 In the reign of Constantine the Great..... 1 to 0½
 The disorders in the Roman Empire under Arcadius and Honorius raised it to..... 1 to 14½
 From which it appears that gold, unless when depressed by sudden and unusual

occurrences, or enhanced by a dread of public insecurity, may be stated to have been for upward of 900 years in the proportion of..... 1 to 10 or 12
 In England, in the reign of Henry III., 1216 to 1272..... 1 to 9½
 In England, in the reign of Edward III., 1330 to 1377..... 1 to 12½
 In England, in the reign of Henry IV., 1400 to 1412..... 1 to 10½
 In England, in the reign of Edward IV., 1461 to 1477..... 1 to 11½
 In England, in the reign of Henry VIII., 1510 to 1547..... 1 to 11.10
 In England, in the reign of Queen Elizabeth, 1560..... 1 to 11
 In England, in the reign of King James I., 1604..... 1 to 12½
 In England, in the reign of King James I., 1601..... 1 to 13½
 In England, in the reign of Charles II., 1665..... 1 to 14½
 In England, in the reign of George I., 1717..... 1 to 15½

Relative proportions in China, according to Humboldt..... 1 to 12½
 Relative proportions in Japan, according to Humboldt..... 1 to 8½
 Relative proportions in Bengal, according to bullion report..... 1 to 14.86
 Relative proportions in Madras, according to bullion report..... 1 to 13½
 Relative proportions in Bombay, according to bullion report..... 1 to 15
 In the China Diaries it is stated at 16 taels of silver to 1 tael of gold of 100 touch of pure gold. If it is meant to be of pure silver also, the proportion would be 1 to 16; but it is believed to be the average fineness of silver in dollars, which would be..... 1 to 14.296

The following is the London price of silver per ounce sterling from 1833-95 (*Statistical Abstract of the United States*, 1895, p. 42):

R. W. Raymond, United States Commissioner of Mining Statistics, estimates the gold mined from 1792 to July 31, 1834, at \$14,000,000, and from that date to 1845 at \$7,500,000. Silver he

estimates for the first period as insignificant, and for the second period at \$250,000.

The following table shows the production of gold and silver by States and by counties:

SOURCES OF THE SILVER PRODUCT OF THE UNITED STATES IN 1893.

STATE OR TERRITORY.	FINE OUNCES SILVER IN—			Total.
	Quartz and Milling Ores.	Lead Ores.	Copper Ores.	
Arizona.....	1,852,200	812,900	270,000	2,935,700
California.....	420,200	49,900	470,100
Colorado.....	11,627,400	12,660,900	1,550,300	25,838,600
Idaho.....	1,035,000	2,884,600	3,919,600
Montana.....	9,016,900	2,427,200	5,500,900	16,945,000
Nevada.....	1,436,300	125,000	1,561,300
New Mexico.....	153,100	306,300	459,400
Utah.....	1,800,000	5,146,300	350,000	7,196,300
All others.....	300,000	300,000	74,000	674,000
Total.....	27,641,100	24,713,100	7,645,800	60,000,000

From an examination of the above table it will be seen that of the 60,000,000 ounces of silver produced in the United States during the calendar year 1893, about 27,600,000 ounces were extracted from milling ores—that is, silver ores proper—while 24,700,000 ounces came from lead ores, and 7,600,000 ounces from copper ores.

It would appear, therefore, that less than one half of

the silver product of the United States is derived from mines producing silver ores proper, and that considerably more than one half of the entire silver output of the United States is an incidental product from the smelting of lead and copper ores, altho this incidental product is frequently more valuable than the other metals contained.

The following table shows the relative variations in wages and prices as measured in currency gold and silver from 1840-92. It is taken from George B. Waldron's *Handbook on Currency and Wealth*, pp. 82, 83. Mr. Waldron says:

"The figures are compiled from the results of the special Senate committee investigation, transmitted to the Senate March 3, 1893. The investigation was made by a sub-committee on tariff, with Nelson W. Aldrich as chairman.

"The comparative percentages on prices are based on quotations of wholesale prices of 223 articles, covering the period from 1860 to 1892, and of 83 articles covering the whole period from 1840. In most cases these were actual prices paid during the month of January, and not average prices for the year. In a few instances, when the January price is not the typical price for the year, the quotations for another month are taken; potatoes, for example, being quoted for October. All these quotations of the 223 articles were reduced to relative percentages with 1860 as 100.

"It would be manifestly unfair to give equal weight to all the quotations and strike a general average for each year, so the attempt was made to give each quotation the weight it would have in the expenditures of the average family. The basis taken was the investigations of the Commissioner of Labor, reported in the seventh annual report (1891), in which the average expenditures of 2561 normal families are found to be as follows:

"Rent, 15.06 per cent.; food, 41.03; fuel, 5.00; clothing, 15.31; light, 0.90; all other purposes, 22.70; total, 100.00 per cent.

"Of the 84.94 per cent. (excluding rent) of the expenditures of the average family, it was found that the

quotations of prices covered 68.60 per cent. Giving to each article the exact weight that it would have in the expenditures of the average normal family, the committee obtained the results given in the first column of prices in the table.

"The method pursued is probably as accurate as any that could be followed. Certain assumptions, however, should be noted. It is assumed that family expenses follow the same proportions in 1840 and 1860 that obtained in 1891. This assumption was necessary from the fact that no earlier investigations of family expenditures were made. Quotations of prices are given always at wholesale, and the assumption is that retail prices have varied in the same ratio. In general this is probably true, but in particular articles and for particular periods this would not be true. But in spite of these assumptions, the investigation is probably the most reliable ever made.

"These prices and percentages are all on a currency basis. This would be the same as the gold basis, except for the years from 1862 to 1878. The second column of prices shows what the variations were on a gold basis at the average price of currency for January of each of these years as given on pages 69 and 70.

"For purposes of further comparison we have added the relative prices in silver from quotations of the January price of silver in London (which is always the governing price), furnished us from the Treasury Department at Washington. Prices measured in silver were at 94.9 in 1860, as shown by the table, and did not rise to par until after 1873, since which time they have been steadily rising.

"A similar plan was followed by the committee in securing the relative wages for the period. Quotations of day wages were obtained, of which 61 series begin as early as 1840, and 543 cover the period from 1860. These quotations, as in the investigation on prices, were reduced to percentages with 1860 as 100, and the

RELATIVE PRICES AND WAGES IN CURRENT, GOLD, AND SILVER—1840 TO 1892.

(All figures are in percentages, with the year 1860 as 100.)

played in each industry by periods of 10 years. Giving to each industry the weight indicated by the relative number of persons employed in that industry, the committee secured the relative wages for each year of the whole period, as given in the first column of relative wages. The columns of wages in gold and in silver were obtained as in the similar columns of prices.

"One caution should be given in passing. The relative wages given are of persons actually employed, and necessarily make no account of the varying number of the unemployed or of those partially employed during the year." See WAGES.

"Gold and silver" are considered in the same connection by Richard P. Rothwell in the volume on *Mineral Industries* of the census of 1890, beginning with page 33. According to this article, "the number of gold and silver 'claims,' or 'locations,' commonly called 'mines,' in the United States is practically beyond computation. The names of nearly 100,000 of such claims or mines were received by the Census Office." But of these only 6004 were finally tabulated as being of sufficient importance to be classed as mines. The relative importance of these is shown by the following table:

GOLD AND SILVER MINES—CENSUS OF 1890. (*Mineral Industries*, p. 35.)

MINES.	Number.	Per Cent. of Producing Mines.
Producing over \$500,000 billion.....	28	0.75
Producing from \$250,000 to \$500,000.....	44	1.18
Producing from \$100,000 to \$250,000.....	107	2.87
Producing from \$50,000 to \$100,000.....	95	2.55
Producing from \$10,000 to \$50,000.....	437	11.72
Producing from \$1,000 to \$10,000.....	1,408	37.76
Producing less than \$1,000.....	1,610	43.17
Total producing mines.....	3,729	100.00
Mines reported working, but not producing.....	1,009
Mines reported idle.....	1,266
Total number of mines reported.....	6,004

Speaking of the influences which affect the production and relative values of gold and silver, the report says (p. 118):

"The production of gold and silver in the United States is coming more and more from the treatment of the gold-bearing ores of other metals, and less from strictly gold and silver ores. The industry is becoming year by year more of a regular non-speculative manufacturing business, in which 'finds' and bonanzas have less and less influence, and it is, therefore, certain to increase with a steady and healthy growth. Investments in precious metal mines still continue to be made as 'gamblers,' and consequently are still, on the whole, unprofitable; but every year diminishes this unhealthy characteristic of mining, and brings the industry more into the category of legitimate industrial enterprises, where investments are made with the same precautions as in other classes of business, and moderate profits are sought as the reward of steady industry, while the class of 'millionaires of a day' is disappearing. At the present time about 134,000 tons, or 72 per cent. of the entire output of lead, is silver-bearing or silver-and-gold bearing, and is 'desilverized' before marketing, while nearly all the copper produced in Montana, amounting in 1889 to about

yearly percentages averaged for each of the 17 general industries represented. The different census reports from 1840 to 1880 showed the number of persons em-

100,000,000 lbs., and nearly all that mined in California, Colorado, Nevada, Utah, and other Western States, except in some of the Arizona copper mines, carries silver and gold. . . .

"The progress in metallurgy is, however, adding still more rapidly to the production of silver than that of gold, so that while the output of gold will probably increase in the future, that of silver, a much more abundant metal in nature, will undoubtedly increase still more rapidly."

Of the capital and expenditures of these mines the report says (*Mineral Industries*, p. 34) :

VALUE OF MINING PLANT.	
Buildings.....	\$7,565,918

As to the cost of producing gold and silver, the report says (p. 119) :

"When the enormous amounts of money actually invested in unprofitable mines and mills are considered, some of which are strictly legitimate and honest, while some have been 'salted' or sold on false representations, it is easy to recognize the heavy offset to the great profits of the few large producers and to believe that the average cost of all the gold produced is more than \$20.67 per ounce troy," and that of silver is more than say \$1 per troy ounce."

Some idea of the immense profits from favorable mines may be obtained from the workings of the famous Comstock Lode, in Storey Co., Nev.

"In a paper by Alfred Doten, of Virginia City, Nev., in the report of the Director of the Mint for 1892, beginning with p. 150, it is shown that from the discovery of the Comstock Lode, in February, 1859, down to 1892, the total production of gold was \$141,986,344, and of silver \$198,877,548, making an aggregate of \$340,863,892, of which 41.65 per cent. was gold and 58.35 per cent. silver. To this should be added \$13,173,947, extracted from the tailings or residue of the ore reduced in the mills, making a total of \$354,037,839 produced from these mines in 34 years. The yield of tailings is about 66½ per cent. of silver to 33½ per cent. of gold."

"For a number of years the companies have been obliged to give sworn quarterly statements to the tax collectors, giving the gross yield of metal less the cost of extraction, reduction, etc. Mr. Doten gives figures from these tax returns, showing that for the 10 years, from 1871 to 1880, there was produced \$192,174,307 in gold and silver, or 56.4 per cent. of the total production of these mines down to 1892. The total cost of mining and reducing this was \$99,579,955, leaving a profit of \$92,594,352, or 48½ cents for every \$1 produced."

"The best six years were from 1873 to 1878, when the mines produced \$157,555,878, with a profit of \$83,895,885, or 53½ cents on every \$1 produced. The largest yield for any one year was \$36,301,537 in 1877, on which the profits were \$21,872,866, or 60½ cents on every \$1 produced."

"Since 1880 the yield has averaged \$3,326,100 per year, and the average profits have been 6½ cents per dollar produced."

"On all the mines of the lode, from the beginning of work down to January 1, 1893, the total dividends declared have been \$134,666,780. Against this are \$52,478,235 in assessments, leaving a net gain of \$81,588,545. The great bonanza represented by the Consolidated Virginia, the California and the Consolidated California and Virginia has declared \$85,170,000 in dividends, against \$2,667,900 in assessments."

"On the other hand, the Sierra Nevada mine shows assessments of \$6,476,920, against \$102,500 in dividends. The stockholders of the Bullion Mine have paid \$2,957,000 in assessments, upon which the mine has been worked for 30 years without producing an ounce of bullion or a pound of pay ore."

We close this article with some statistics bearing on the amount of gold and silver in the world. According to the report of the Director of the Mint for 1894, the amount of gold in the world used as money was \$3,901,900,000; the amount of silver, \$3,931,100,000. Of the latter amount, \$854,000,000 was in countries using silver only. Professor Taussig (*The Silver Situation in the United States*) shows that the geologists think the amount of silver production cannot increase much more; and the facts show that it is steadily increasing. (See table above.) President Andrews ("The Future of Silver Production," in *An Honest Dollar*, ed. of 1894) argues that the production has reached its height. He says: "The topographical conditions of mining are becoming more adverse." A *résumé* of the critical views of metallurgists in United States Consular Report No. 87, December, 1887, strongly supports this view, as does Suer's *Die Zukunft des Goldes and The Future of Silver*.

GOMPERS, SAMUEL, was born in London. Apprenticed to a shoemaker at the age of 10, his education was obtained after working hours. Later he became a cigar-maker and came to the United States in his fourteenth year, and has since resided in New York. Joining the Cigar-makers' Union immediately after his arrival, he became prominent in its councils, and served as President of Union No. 144 for six years. He has been a delegate to every convention of the Cigar-makers' International Union since 1877, and its constitution is largely the result of his earnest efforts toward the up-building of that powerful organization. He has represented his international union at every convention of the American Federation of Labor, was its first president, and held that position till 1895, when he was defeated on account of his opposition to the endeavors of the Socialist Labor Party to capture the federation. In 1895, however, he was reelected president.

Mr. Gompers has repeatedly declined election to prominent and lucrative political positions, and during the first six years of his official duty he received no salary nor any other emolument. In the great eight-hour struggle of 1886 he paid his entire expenses and worked night and day for many weeks.

GOOD GOVERNMENT CLUBS.—The establishment of "good government clubs," whose object is explained by their name, began with the formation of the City Club, of New York City, April 13, 1892.

The failure of the Municipal League to elect its candidate to the mayoralty in 1891 occasioned profound discouragement among those desirous of obtaining good city government. It seemed to indicate that mere popular indignation or enthusiasm could not be counted upon when pitted against an organized political machine. It became clear, therefore, that if the work of improving city government was to be undertaken at all, it must be undertaken upon a permanent plan—a fact which suggested the organization of a social club which would serve to bring together and to keep together all those interested

in the organization of a municipal party built upon the principle that city government should be separated from national politics.

The City Club was therefore established, largely owing to the efforts of Mr. Edward Kelly. One of its chief activities was to establish other local clubs, which were called good government clubs, and have been very successful. Their cardinal principle is the separation of municipal government from national politics; and, with a view of securing this, it is proposed to direct their energies to securing (1) honest and unbiased primaries; (2) ballot reform; (3) separate elections; (4) home rule.

Wherever a nucleus or group of citizens can be found to adopt the views, a club can be organized, with headquarters or club house as circumstances appear to require. The first was organized in February, 1893, and some 23 others in New York City within two years. In March, 1894, they were confederated and a council established. Similar clubs have been started in other cities as far as California. The clubs have committees on municipal government, various municipal undertakings (like street cleaning), cooperation with other clubs, etc.

GOOD TEMPLARS.—The Independent Order of Good Templars is a beneficial order, based on total abstinence, founded in Central New York in 1851, and now organized in nearly every State of the Union, England, Ireland, Scotland, Wales, Germany, Denmark, Sweden and Norway, Canada, West Indies, East, West, and South Africa, Australia, New Zealand, British India, Iceland, and other countries. All persons becoming members of the order are required to subscribe to the following pledge: "That they will never make, buy, sell, use, furnish, nor cause to be furnished to others, as a beverage, any spirituous or malt liquors, wine, or cider, and will discountenance the manufacture and sale thereof in all proper ways."

The last report of the Right Worshipful Secretary puts the number of grand lodges in the world at 100, the membership at 403,849, with 169,804 in juvenile branches.

GOUGH, JOHN BARTHOLOMEW, was born at Sandgate, Kent, England, in 1817; his father a pensioner of the Peninsular War; and his mother a village schoolmistress. At the age of 12 he went to America as an apprentice, and worked on a farm in Oneida County, N. Y. In 1831 he went to New York City, where he found employment in the binding department of the Methodist book establishment; but habits of dissipation lost him this employment, and reduced him to that of giving recitations and singing comic songs at low grog shops. He was married in 1839; but his drunken habits reduced him to poverty, and probably caused the death of his wife and child. A benevolent Quaker induced him to take the pledge; and he attended temperance meetings and related his experience with such effect as to influence many others.

He then became a prominent advocate of the temperance cause; but in 1842 some of his former companions led him to violate his pledge. He subsequently confessed his fault and endeavored to make amends. After 10 years of great success as a temperance lecturer he went to England in 1853 and carried on a remarkable work there. He returned to the United States in August, 1860, and soon began to lecture on *Street Life in London*. Other subjects were added to his list, and in all he retained his great popularity. In 1873 he announced that he would retire from the lecture field, but he was afterward prevailed upon to appear on special occasions. In 1878 he again visited England. He died at Philadelphia, February 18, 1886. In 1869 he issued his *Autobiography and Personal Recollections*, and in 1880 *Sunshine and Shadow*, being chiefly passages from his lectures.

GOULD, DR. ELGIN R. L., was born August 15, 1860, at Oshawa, Ontario, Canada, and received his early education at home. He attended the Victoria University, Coburg (now at Toronto), where, in 1881, he received the degree of A. B. He then entered at Johns Hopkins University for graduate study, where, in 1886, he secured the degree of Ph. D., his studies having been interrupted for a time by a serious illness. During the years 1884-87 Dr. Gould was instructor in charge of the Department of History and Political Economy in the Washington (D. C.) High School. In 1885 he conducted an official inquiry in Belgium and Germany for the Department of Labor, and in 1887 became permanently connected with the department as a statistical expert. He has been especially identified with the work of the department abroad, having spent four years there in prosecuting various inquiries. In 1887-88 Dr. Gould was Reader in Social Statistics at the Johns Hopkins University, and in 1892 Resident Lecturer on Social Economics and Statistics. He has represented the United States Government at various international congresses, and is a member of economic and statistical societies at home and abroad. In 1894 he became Professor of Statistics in the University of Chicago. Professor Gould believes thoroughly in the application of the historical method and of statistics to economics, but does not accept the opportunism of some of the historical school. He believes in

the gradual reduction of the tariff and in international bimetalism; he does not believe in the nationalization of natural monopolies, but thinks the municipalization of some of them might be carefully tried. Among the most important of his many publications are *The Social Conditions of Labor*, *The Gothenburg System of Liquor Traffic*, and *The Housing of Working People*—the last two being reports to the Department of Labor.

GOURNAY, JEAN CLAUDE MARIE VINCENT, SEIGNEUR DE, was born at Saint Malo in 1712. Traveling as a merchant in Spain, Holland, and England, he published in France on his return a report on the economic and financial condition of these countries. Appointed Intendant du Commerce in 1851, his observation convinced him that the lack of development in French manufacturing was due to the various governmental restrictions, and he came thus to largely to not wholly embrace the views of the Physiocrats (*q. v.*), and became the author of the famous phrase, "*Laissez faire, laissez passer.*" He died in 1759.

GOVERNMENT (from Latin *gubernare*, to steer, direct, govern) is the power in the State by which the affairs of State are conducted. Government may be of any form—monarchical, despotic, autocratic, aristocratic, plutocratic, democratic; it may be local, municipal, State, or national. (For the principles involved and the various forms of government, see STATE; FEDERATIONS; REPUBLICAN PARTY; DEMOCRATIC PARTY; ANARCHISM; INDIVIDUALISM; SOCIALISM; VOLUNTARISM, etc.)

"Government means power to enforce a decision—this is its essential nature. In an ideal order of things, social action might be possible without government; in the present order of things social action and government are practically interconvertible terms."

Says Hamilton (*Federalist*, No. 15), "Why has government been instituted at all? Because the passions of men will not conform to the dictates of reason and justice without constraint." (For a discussion of this, see ANARCHISM; SOCIALISM; STATE.)

Of the cost of government, Mr. Edward Atkinson (*Harper's Weekly*, July, 1895) writes concerning the United States and other countries:

"The true annual cost of supporting this Government, including civil and military service, naval service, the construction of public works and improvements, miscellaneous expenditures, interest, pensions, sugar bounties, and other charges, has been, from 1880 to 1894 inclusive, on the average, a fraction over \$282,000,000; the average revenue during the same period, a fraction over \$365,000,000. The surplus, mainly applied to the reduction of deb., has averaged \$83,000,000 a year. The nearest approach to a billion-dollar expenditure in any two years occurred in 1893 and 1894, when the amount, aside from the postal service, not including the postal deficiency, came to less than \$750,000,000 or three quarters of a billion. Of course annual expenditures increase somewhat with the growth of population. During the last administration expenditures were increased both in amount and in proportion to numbers. They are now being diminished in the aggregate and yet more in the ratio per head of population. The following table gives the facts, omitting the postal service, also omitting premium on bonds purchased and other non-recurrent items. If these latter items were included, the average per capita expenditure would show 19 cents per head more:

YEAR.	Revenue.	Per Head.	Expenditures.	Per Head.
1880.....	\$333,526,401	\$6.825	\$258,902,180	\$5.298
1881.....	360,782,293	7.193	253,137,478	5.047
1882.....	403,525,250	7.864	248,244,691	4.837
1883.....	398,287,581	7.587	258,045,546	4.916
1884.....	348,519,870	6.491	237,659,244	4.426
1885.....	323,690,706	5.895	253,674,439	4.620
1886.....	336,439,727	5.992	236,383,979	4.210
1887.....	371,403,278	6.470	261,737,657	4.560
1888.....	379,266,075	6.463	253,494,650	4.320
1889.....	387,050,959	6.454	275,104,407	4.587
1890.....	403,080,983	6.577	291,028,440	4.749
1891.....	392,612,447	6.270	346,845,214	5.539
1892.....	354,937,784	5.548	333,872,752	5.219
1893.....	385,819,620	5.899	370,132,606	5.659
1894.....	297,722,010	4.455	351,234,799	5.346
Total.....	\$5,476,664,102	\$4,235,486,082
Average..	\$365,110,949	\$282,365,738

Difference in totals, \$1,241,178,020; in averages, \$82,745,200.

"Even this table does not show all the facts as to the actual cost of government. During the years 1891 to 1894, inclusive the direct-tax charge assessed during the war was returned to the amount of \$15,218,665. Sugar bounties which had been declared unlawful by the district court of the District of Columbia were paid to sugar-planters to the amount of \$29,797,308.13."

"From 1882 to 1888," continues Mr. Atkinson, "the cost of our Government was only \$4.58 per head, while the revenue was \$6.50 a head. Since 1890 excessive expenditure and diminished revenue have brought about a temporary deficit, but if the future Congresses are reasonably economical, 'there can be little doubt that the revenue at \$5 per head will develop the surplus of \$1,200,000,000 in the next 15 years, which may be applied to the final payment of the debt of the United States.' In that event 'the cost of the Government, interest, and diminishing pensions will be \$4 per head.'"

Turning next to the cost of government in other countries, Mr. Atkinson finds that our burden is very light indeed in comparison with that of other nations. He writes:

"Even at \$5 per head our rate of national taxation is but a fraction over one half as much as that imposed in Great Britain for the same national expenditures. It is, as far as I can ascertain, less than one half the taxation of Germany for imperial purposes; but that comparison is rendered uncertain by the large element of expenditures of the kingdoms forming the empire, which are included in our national bill of cost. At \$5 per head our national taxation will be about one third that of France. But here again the true burden upon France is rendered obscure by the constant deficit and the obligations of the Government on the part of railway service. It is also about one third the burden upon poor Italy. If we take out the \$1 per head which is to be applied to the final payment of the debt, and deal only with the ratio of the cost of our Government to that of their governments, our position is correspondingly improved. But even this comparison does not show the true relative burden of national taxation.

"If our cost of government shall be but \$4 for the next 15 years, it will come to less than 2 per cent. of our average product. The imperial taxation upon Great Britain on a much less product per capita must be at least treble our own in ratio to product, while that of France bears a yet greater proportion to production. That of Germany takes out from the product of a poor soil so much that there is barely enough to support a large proportion of the population, while it is alleged that the imperial taxation of Italy absorbs at least 30 per cent. of the product of the whole country.

The other side to this somewhat roseate view is to ask what governments do for their citizens. There are those who believe that, so measured, the United States Government is not so cheap. Other countries protect their citizens everywhere. Germany, with her insurance laws; Belgium, with her cheap nationalized railroads,

all continental European countries, with their cheap national telegraph systems; England and most European countries with their postal savings-banks, afford elements of a view very different from Mr. Atkinson's. Some even urge that there is more liberty and freedom of action in Europe than in America. The curse of European governments is their standing armies. (See STATE.)

GRANGERS.—An association of American agriculturists, commonly known by this name, tho formerly called Patrons of Husbandry.

Soon after the close of the Civil War President Johnson sent O. H. Kelly, an employee of the Department of Agriculture, as an agent into the Southern States to investigate the condition of the farmers in that section of the country and to report the result of his observations. He was so seriously impressed with what he saw that he proposed a national association of farmers, with branches in all sections of the country. On his return to Washington he held a consultation with J. R. Thompson and W. M. Ireland, also of the Department of Agriculture, who indorsed the views of Mr. Kelly. William Saunders, Rev. John Trimble, Rev. N. B. Grush, all in the employ of the Government, and F. M. McDowell, of Wayne, N. Y., were consulted, and these seven men met at the office of Mr. Saunders on December 4, 1867, and organized the National Grange, with Saunders as Master, Thompson as Lecturer, Ireland as Treasurer, and Kelly as Secretary. The object was to organize the farmers not only of the South, but of all parts of the country.

Under the scheme of the order it was to be divided into national, State, and subordinate assemblies, or "granges." Women were to be admitted to membership on equal standing with men. The ritual embraced four degrees for men, under the titles of "laborer," "cultivator," "harvester," and "husbandman," and four for women, entitled "maid," "shepherdess," "gleaner," and "matron." The purposes of the order were two—the industrial benefit and the social improvement of its members. The discussion of any political question was strictly forbidden.

Tho the order is thus fundamentally non-political, it has been extremely difficult to keep it free from political influences. Its extent is a standing temptation to politicians; and its aim to cheapen transportation has a constant tendency to carry it into a quasi-political warfare against railroad corporations. Its leaders have, however, been successful in the main in keeping it out of politics, and it is different in this respect from the other farmers' organizations. (See FARMERS' ALLIANCE.)

Up to the close of 1871 there were but about 200 granges organized, while the national grange contained only its seven original members. From this time forward its progress was rapid. The farming population began to perceive the advantages of the association, and grew as enthusiastic as they had been lethargic. In 1872 there were organized 1160 granges; in 1873, 8669; and in 1874 and 1875 about 11,000 in each year. At the close of 1875 there were about 30,000 granges in existence, said to average

about 40 members each, the order being strongest in the West and Northwest and well represented in the South. The reason for this extraordinary growth is found largely in the discontents arising from the causes which resulted in the financial crisis of 1873, and from the industrial depression following. The inflation of the currency and the increase in credit through each venture were instruments in building up gigantic speculative operations, which finally resulted in a crash. During the apparent prosperity of trade men were attracted from agriculture to trade. Farm land declined, while city real estate rose. Speculation and "corners" in staple farm products caused great fluctuations in prices, while the prices of farmers' necessities rose. By this time its climax of prosperity had been reached. In the succeeding years jealousy arose between the subordinate and the national granges, and parties with no interest in agriculture beyond that of fleecing the farmers made their way into the order. So far was this carried that one grange was organized on Broadway, New York City, with 45 members, representing a capital of perhaps as many millions, and composed of bank presidents, wholesale dealers, sewing-machine manufacturers, and speculators. Other instances of a similar character might be named. The result of all this was a great depression of the order. Nevertheless, the order has endured, and has had no little influence. At its twenty-fifth anniversary in 1891 it claimed to have prevented the renewal of patents on sewing-machines, thus saving to the people millions annually; to have taught transportation companies that the creator is greater than the creature; to have passed and enforced oleomargarine laws, laws restricting alien landlords and corporations, the interstate commerce law, ballot reform laws, the making the Secretary of Agriculture a Cabinet officer. It claimed to have led in establishing agricultural colleges and stations, arbor days, public schools, numerous local institutions.

Cooperation has been much favored by the Grange, and numerous experiments have been tried, but without great success. (See COOPERATION.)

The method of cooperative buying most prevalent in New England is that by trade discounts or trade lists. The State granges make arrangements with certain large manufacturers and wholesale firms for discounts on cash payments. Each subordinate grange chooses a purchasing agent, who receives the lists and makes the purchases. The agents and members receiving the discount are bound to keep the discounts secret. Another analogous method is to furnish members with "trade cards," on presentation of which to the firms under contract with the State grange discounts are allowed. This method is employed largely in Vermont, Rhode Island, and Connecticut, while Massachusetts has mere purchasing agents and Maine has its grange store.

The strongest cooperative enterprises of the grange in New England are the fire insurance companies. Connecticut, New Hampshire, and Massachusetts each have one. The Connecticut Patrons' Mutual Fire Insurance Company was organized in 1888. In 1892 there were about 1000 policies out, representing a risk of about \$1,600,000. In 1891 alone, policies to the amount of \$52,926 were taken out. The first assessments were made in 1892, and this owing to the unusually heavy losses from lightning. The Massachusetts Fire Insurance Company began business in 1887. In 1890 it reports 1050 policies in force, covering \$1,187,586 worth of property. The New Hampshire company is the strongest. In 1892 it had 1600 policies, covering insurance to the amount of \$2,200,000, as against 1399 policies

in 1891, covering risks amounting to \$1,872,677.17. No assessments have been necessary.

At the St. Louis session of the national grange, in 1874, the following "Declaration of Purposes" was issued:

"We shall endeavor to advance our cause by laboring to accomplish the following objects:

"To develop a better and higher manhood and womanhood among ourselves; to enhance the comforts and attractions of our homes and strengthen our attachments to our pursuits; to foster mutual understanding and cooperation; to maintain inviolate our laws and to emulate each other in labor to hasten the good time coming; to reduce our expenses, both individual and corporate; to buy less and produce more, in order to make our farms self-sustaining; to diversify our crops and crop no more than we can cultivate; to condense the weight of our exports, selling less in the bushel and more on hoof and in fleece, less in lint and more in warp and woof; to systematize our work and calculate intelligently on probabilities; to discountenance the credit system, the mortgage system, the fashion system, and every other system tending to profligacy and bankruptcy.

"We propose meeting together, talking together, working together, buying together, selling together, and, in general, acting together for our mutual protection and advancement, as occasion may require. We shall avoid litigation as much as possible by arbitration in the grange. We shall constantly strive to secure entire harmony, good-will, vital brotherhood among ourselves, and to make our order perpetual."

The war in the West against unjust discrimination in railroad freights, which produced restrictive laws in Illinois and Wisconsin in 1873, has been charged upon the granges, but falsely, as they declare. It was organized and sustained by agricultural clubs outside the order, whose constitution did not permit a participation in it, tho the members were undoubtedly in strong sympathy with its objects. They succeeded in 1873 and 1874 in carrying the legislatures of Illinois and Wisconsin; these legislatures passed stringent laws directed against "extortion and unjust discrimination in the rates charged for the transportation of passengers and freights." These acts were subsequently repealed, but while they were in force had a very unfavorable effect on the railroads. In Congress their efforts led to considerable discussion regarding the regulation of interstate commerce, since consummated by the act of February 4, 1887. Other questions which the grange has taken in hand are such as the rapid increase of insects through undue destruction of insectivorous birds, the exposure of attempted swindles, to which the isolation of the farmer renders him particularly liable, and of combinations to extort money for the use of articles falsely claimed to be patented, such as the *swing gate*, the *driven well*, etc., and particularly the sale of oleomargarine passed off for butter. Some of the public questions which the organization at present is interested in agitating are:

Passage of measures to prevent adulteration of food. Passage of the Washburn-Hatch bill. Free delivery of mail to rural population. Non-irrigation of the arid lands of the West by the Government, on the ground that the lands are not yet needed. The securing of laws to remedy unequal taxation. Promotion of interest in agricultural colleges. Action for better roads, etc.

Of late the Grange has been wholly eclipsed in large sections of the country by the Farmers' Alliance. Yet it still exists, and is particularly strong in the East, where the Farmers' Alliance movement has taken small hold. In 1892 the membership was about 50,000.

GREEK SOCIAL POLITY.—This was, in a word, the exaltation of the State, ordinarily a democratic city, based upon slave labor, over all departments of life. (See the articles ATHENS; ARISTOTLE; PLATO.) We give here simply the synopsis of the Greek economic and social idea, as given in Professor Ingram's *History of Political Economy*:

"1. The individual is conceived as subordinated to the State, through which alone his nature can be developed and completed, and to the maintenance and service of which all his efforts must be directed. The great aim of all political thought is the formation of good citizens; every social question is studied primarily from the ethical and educational point of view. The citizen is not regarded as a producer, but only as a possessor of material wealth; and this wealth is not esteemed for its own sake or for the enjoyments it procures, but for the higher moral and public aims to which it may be made subservient.

"2. The State, therefore, claims and exercises a controlling and regulating authority over every sphere of social life, including the economic, in order to bring individual action into harmony with the good of the whole.

"3. With these fundamental notions is combined a tendency to attribute to institutions and to legislation an unlimited efficacy, as if society had no spontaneous tendencies, but would obey any external impulse, if impressed upon it with sufficient force and continuity."

GREELEY, HORACE, was born in Amherst, N. H., February 3, 1811. Before he was 10 years old his father became bankrupt. The family then moved to Vermont, where they made a scanty living as day laborers. When 14 years of age Greeley was apprenticed in the office of the *Northern Spectator*, East Poultney, Vt. His wages were but \$40 a year; but by living on almost nothing he was able to send money home. He remained here six years, when the paper was suspended. For a time he worked with his father on a rough farm in Pennsylvania, and then began to tramp the country in search of employment. Traveling mostly on foot, in 1831 he entered New York with \$10 in his pocket, and for a while had to accept the hardest work and poorest pay. In 1833 he formed a partnership with a fellow-workman, Francis V. Story. Combining their capital, which amounted to \$150, they commenced by printing the *Morning Post*, which failed in three weeks. But Greeley went on writing as well as printing. He was invited by James Gordon Bennett to go into a partnership with him in the *Herald*, but he declined, and issued instead the *New Yorker*, a literary journal which lived seven years. Later he published the *Log Cabin*, a weekly campaign paper, which was a great success. On April 10, 1841, Greeley commenced the New York *Tribune*, which was to be his life-work.

He was now entirely without money. From a personal friend, Mr. James Coggeshall, he borrowed \$1000, on which capital and the editor's reputation the *Tribune* was founded. It began with 600 subscribers. The first week's expenses were \$525 and the receipts \$92. By the end of the fourth week it had run up a circulation of 6000, and by the seventh reached 11,000, which was then the full capacity of its press.

Mr. Greeley opened its columns to well-nigh every reform. He made it the leading abolition newspaper. He advocated in it dress reform, vegetarianism, and Fourierism.

From 1850 until the end of the Civil War the *Tribune* did much to create and awaken the anti-slavery sentiment of the North. Altho before the war he declared himself willing that the slave States should secede, if they honestly desired to leave the Union, yet when the rebellion had begun he threw himself heartily on the side of the Government. He urged in his paper

the vigorous prosecution of the war, but at its close immediately advocated universal amnesty and suffrage. He exhibited his impartiality and moral courage by protesting against the prolonged imprisonment of Jefferson Davis, and, in spite of Northern sentiment, was one of the signers of Davis's bail bond. He held that to make a martyr of a Southerner by unwarranted imprisonment was an unnecessary hindrance to a peaceful reconstruction, an infraction of the Constitution, and a stain upon the character of the republic.

From 1848-49 he was a Whig representative in Congress, but gained hostility even in his own party by advocating mileage reform. He was one of the founders of the Republican Party, and by opposing Seward did much to give the nomination to Abraham Lincoln. In 1861 he was candidate for United States Senator, but was defeated by Ira Harris.

In 1867 he was appointed delegate to the convention for the revision of the Constitution. He antagonized General Grant's administration, and was one of the chief promoters of the Liberal Republican Party, which held its national convention at Cincinnati in 1872, and nominated him for President. His lifelong opponents, the Democrats, nominated him also at their national convention—a move which greatly lessened his chances of success by repelling many of his Republican supporters. During the canvass feeling ran high, and he took the field in person and made one of the most brilliant, able, and sustained series of campaign speeches on record.

In the election he received 2,834,079 votes as against 3,597,070 for Grant. Greeley carried Georgia, Kentucky, Maryland, Missouri, Tennessee, and Texas.

He at once resumed the editorship of the *Tribune*, but it was soon evident that he had overtaxed his strength in the campaign. No sooner was it ended than he was called to the bedside of his dying wife, from which he went only to be himself prostrated by a nervous disorder of the brain. His illness was short and severe, and on November 29, 1872, he died. His decease made a profound impression upon the country, and showed how deeply and truly he was esteemed by men of all sects and parties. His published volumes are as follows: *Hints Toward Reforms* (1850); *Glances at Europe* (1851); *History of the Struggle for Slavery Extension* (1856); *Overland Journey to San Francisco* (1860); *The American Conflict* (2 vols., 1864-66); *Recollections of a Busy Life* (1868); *Essays Designed to Elucidate the Science of Political Economy* (1870); and *What I Know of Farming* (1871). His life was written by James Parton in 1855, and a new edition appeared in 1868.

GREENBACK PARTY, THE, originated in 1873-74 in the opposition felt by many to the asserted manipulation of the currency in favor of the banking and bond-holding class. (See CURRENCY.) It was claimed that the bankers of the country had conspired (1) to make the issue of the war greenbacks a failure by inducing Congress to prevent their being legal tenders for customs and for payment of the national debt, and so depreciating their value; (2) to

buy up these greenbacks at their depreciated value, and with them purchase bonds, paying for the bonds with greenbacks at their face value; (3) to induce Congress to vote that these bonds bought with greenbacks at 30 cents on the dollar should be redeemed by Congress under the pretence of national faith and of "an honest dollar" in gold, in interest as well as capital, while the soldiers and sailors of the war who had risked their lives and got no "interest" had been paid in greenbacks. Intense excitement was aroused, which the period of contraction of the currency greatly increased. As early as 1868 the demand was broached called "the Ohio idea," that all bonds which did not distinctly call for payment in coin should be redeemed in greenbacks. This "idea" seemed to have dominated the Democratic convention of 1868, but was distinctly disavowed by Mr. Tilden and other leading Democrats. Many local and State conventions in the West, however—chiefly Democratic—endorsed the idea. Its advocates still hoped to bring the entire party to their way of thinking.

Finally the financial crisis of 1873 caused the masses of the people to seek legislative relief for the evils from which they were suffering, and produced a certain disintegration of the established political parties. The pressing questions of the time appeared to require and justify new political organizations. A greenback convention was held at Indianapolis in 1874, and demanded: (1) The withdrawal of the national bank-note currency; (2) that the only currency should be of paper, and that such currency should be made exchangeable for bonds bearing interest at 3.65 per cent.; and (3) that coin might be used for the payment of the interest and principal of such bonds, and such only, as expressly called for coin payments. In 1876 a national greenback convention was held at Indianapolis, which nominated Peter Cooper, of New York, and Samuel F. Cary, of Ohio, for President and Vice-President of the United States. In the election which followed they received 81,737 popular votes.

To these attempts to found a new party, based on financial issues, a turn in another direction was given by the labor troubles which had culminated in the great railroad strikes of 1877. In 1878 a "national or greenback-labor convention" was held at Toledo, O., as the result of a coalition between the labor reformers and the advocates of a greenback currency. In the following election the Greenback-Labor tickets polled over 1,000,000 votes, and 14 representatives of the party were sent to Congress. But the party was made up of different elements; and altho the distress which gave it such a sudden increase of strength was real, none of the party leaders seem to have had definite ideas as to what was to be done to effect a cure. In 1880 the Greenback-Labor convention, at Chicago, nominated for the offices of President and Vice-President James B. Weaver, of Iowa, and B. J. Chambers, of Texas. In that year the popular Greenback-Labor vote was 300,867, and eight of their representatives were elected to Congress. The ticket in 1884 was headed by General B. F. Butler, who was also the Anti-Monopoly candidate, and received 175,380 votes.

In that year the Greenback ticket in Iowa, Michigan, and Nebraska was fused with that of the Democrats, and in Missouri and West Virginia with the Republican ticket.

The Greenback Party proper has always had its strongest support in the Western States. In Maine, New York, Vermont, and Massachusetts the Greenback element has been made up of labor reformers, and its tickets have generally been supported principally by laboring men. But on several occasions the Greenbackers have received much encouragement and support from either one or the other of the two great parties of the country, who have hoped to create a diversion in their own favor by running a third ticket, so made up as to draw votes from the opposing party.

The following is the platform of the Greenback Labor Party, adopted at the National Convention, held in Chicago, June 9 and 10, 1880:

"Civil Government should guarantee the divine right of every laborer to the results of his toil, thus enabling the producers of wealth to provide themselves with the means for physical comfort and the facilities for mental, social, and moral culture; and we condemn as unworthy of our civilization the barbarism which imposes upon the wealth producers a state of perpetual drudgery as the price of bare animal existence.

"Notwithstanding the enormous increase of productive power, the universal introduction of labor-saving machinery, and the discovery of new agents for the increase of wealth, the task of the laborer is scarcely lightened, the hours of toil are but little shortened, and few producers are lifted from poverty into comfort and pecuniary independence.

"The associated monopolies, the international syndicates, and other income classes demand dear money and cheap labor, a 'strong Government,' and hence a weak people.

"Corporate control of the volume of money has been the means of dividing society into hostile classes; of the unjust distribution of the products of labor, and of building up monopolies of associated capital, endowed with power to confiscate private property. It has kept money scarce, and scarcity of money enforces debt-trade, and public and corporate loans—debt engenders usury, and usury ends in the bankruptcy of the borrower.

"Other results are deranged markets, uncertainty of manufacturing enterprise and agriculture, precarious and intermittent employment for the laborer, industrial war, increasing pauperism and crime, and the consequent intimidation and disfranchisement of the producer, and a rapid declension into corporate feudalism.

"Therefore we declare:

"1. That the right to make and issue money is a sovereign power to be maintained by the people for the common benefit. The delegation of this right to corporations is a surrender of the central attribute of sovereignty, void of constitutional sanction, conferring upon a subordinate irresponsible power, and absolute dominion over industry and commerce. All money, whether metallic or paper, should be issued and its volume controlled by the Government, and not by or through banking corporations, and when so issued should be a full legal tender for all debts, public and private.

"2. That the bonds of the United States should not be refunded, but paid as rapidly as it is practicable, according to contract. To enable the Government to meet these obligations, legal tender currency should be substituted for the notes of the national banks, the national banking system abolished, and the unlimited coinage of silver, as well as gold, established by law.

"3. That labor should be so protected by national and State authority as to equalize its burdens and insure a just distribution of its results; the eight-hour law of Congress should be enforced; the sanitary condition of industrial establishments placed under rigid control; the competition of contract convict labor abolished; a bureau of labor statistics established; factories, mines, and workshops inspected; the employment of children under 14 years of age forbidden, and wages paid in cash.

"4. Slavery being simply cheap labor, and cheap labor being simply slavery, the importation and presence of Chinese serfs necessarily tends to brutalize and degrade American labor; therefore, immediate steps should be taken to abrogate the Burlingame treaty.

"5. Railroad land grants forfeited by reason of non-fulfillment of contract should be immediately reclaimed by the Government; and henceforth the public domain reserved exclusively as homes for actual settlers.

"6. It is the duty of Congress to regulate interstate commerce. All lines of communication and transportation should be brought under such legislative control as shall secure moderate, fair, and uniform rates for passenger and freight traffic.

"7. We denounce, as destructive to prosperity and dangerous to liberty, the action of the old parties in fostering and sustaining gigantic land, railroad, and money corporations and monopolies, invested with and exercising powers belonging to the Government, and yet not responsible to it for the manner of their use.

"8. That the Constitution, in giving Congress the power to borrow money, to declare war, to raise and support armies, to provide and maintain a navy, never intended that the men who loaned their money for an interest consideration should be preferred to the soldier and sailor who periled their lives and shed their blood on land and sea in defense of their country, and we condemn the cruel class legislation of the Republican Party, which, while professing great gratitude to the soldier, has most unjustly discriminated against him, and in favor of the bondholder.

"9. All property should bear its just proportion of taxation, and we demand a graduated income tax.

"10. We denounce as most dangerous the efforts everywhere manifest to restrict the right of suffrage.

"11. We are opposed to an increase of the standing army in time of peace, and the insidious scheme to establish an enormous military power under the guise of militia laws.

"12. We demand absolute democratic rules for the government of Congress, placing all representatives of the people upon an equal footing, and taking away from committees a veto power greater than that of the President.

"13. We demand a government of the people, by the people, and for the people, instead of a government of the bondholder, by the bondholder, and for the bondholder; and we denounce every attempt to stir up sectional strife as an effort to conceal monstrous crimes against the people.

"14. In the furtherance of these ends we ask the co-operation of all fair-minded people. We have no quarrel with individuals, we wage no war upon classes, but only against vicious institutions. We are not content to endure further discipline from our present actual rulers, who, having dominion over money, over transportation, over land and labor, over the machinery of Government, and largely over the press, wield unwarrantable power over our institutions, and over life and property."

For a discussion of these principles, see PAPER MONEY; MONEY; SILVER.

The literature of the movement is large, but much of it was in only transient form. Among the best books is B. S. Heath's *Labor and Finance Revolution*. The papers of Henry C. Baird and *The Currency Question*, a pamphlet by G. M. Steele, contain more moderate statements of the views of the Greenback Party.

GRONLUND, LAWRENCE, was born in Denmark in 1848. As a boy he was in the war between Denmark and Germany. He later graduated at the university and commenced the study of law, but came to the United States in 1867, and taught German in a public school in Milwaukee. In 1869 he was admitted to the bar, and practised in Chicago. He then became interested in socialism by reading Pascal's *Pensées*, which, he says, made him "a socialist before he knew it." In 1880 he published a dialogue on *The Coming Revolution*, and in 1884 his *Cooperative Commonwealth*, which was the first full statement of modern socialism published in this country, and that has had a wide sale and

influence. Mr. Gronlund has since given all his time to the propaganda of socialism. He has written and lectured wherever he could get a hearing—in Chicago, New York, Boston, and more recently on the Pacific coast, where he has organized several Fabian clubs. He held for a while an office in the United States Labor Department, but relinquished it for the lecture field. In 1887 he published *Danton*, a study of the French Revolution, from the standpoint of an admirer of Danton, who believes him to have been greatly misjudged. In 1890 he published *Our Destiny*, a work religious as well as socialistic, which has had a large sale, especially in England, where 1000 copies were sold in the first month. It has also had a favorable reception in France, where it was called by the *Revue d'Economie Politique* "the most elevated and attractive conception of socialism yet published." Its central thought is that socialism is not a "bread and butter question," nor one of either personal or even altruistic idealism, but a movement toward the organic unity of national society, without which true morality is impossible.

GROTIUS, HUGO, or DE GROOT, was born at Delft in 1583; his father was the burgo-master. He entered the University of Leyden in 1594 and took his degree in 1598. Traveling in France, he returned to practise as a lawyer, and in 1607 was fiscal general, and in 1610 council-pensionary at Rotterdam. For supporting the Remonstrants he was condemned, in 1619, to imprisonment for life, but escaped by the aid of his wife, who took his place in the castle, tho for her bravery she was set free. He wandered through the Netherlands and France, and for a while enjoyed a pension at the court of Louis XIII. He was allowed to return to Holland, but again exiled for life. A wanderer again, he entered the service of Sweden, and from 1635-45 was Swedish ambassador at Paris. Returning to Sweden, he passed through Amsterdam, and was honored there as well as in Sweden. He received a pension, but while journeying fell ill and died at Rostock in 1845. He was a profound scholar, an eminent theologian, an erudite historian, a Latin poet, an eminent jurist. His *De Jure Belle et Pacis* (1625) has been translated into all the languages of Europe, and may be called the basis of international law. (See POLITICAL SCIENCE.)

GRÜN, KARL, was born at Lüdenscheid, in Westphalia, in 1817. A Hegelian, he became editor of a Mannheim journal in 1842, and advocated socialistic views till expelled from the duchy. After 1868 he lived in Vienna, writing various literary and philosophical works till his death in 1887.

GUESDE, JULES, was born at Paris in 1845. Entering political journalism at Paris, Toulouse, and Montpellier, at the latter place he published the *Droits de l'homme*, and was imprisoned six months for a revolutionary article against the empire. At the time of the Commune he attempted to stir up a revolution in Montpellier, and was condemned to five years' imprisonment; he fled to Geneva and joined the Internationalists. Driven to Italy, he returned

to Paris in 1876 and edited the *Citoyen*, the *Cri du Peuple*, and then founded the *Egalité*, the first paper of modern Marxist socialism in France. In 1879, with Marx, Engels, and La Fargue, he drafted the program of the Marxist *Parti ouvrier français*, of which he has ever been a foremost leader. (See FRANCE.) He was imprisoned for six months in 1878, and again in 1883 for his socialist activities. In 1893 he was elected deputy from Roubaix, and has become perhaps the foremost leader of French Marxist socialism. Among his numerous other brief writings are *Collectivisme et Révolution* (1879); *Socialisme et services publics* (1884); *Le Collectivisme au Collège de France* (1884).

GUILDS.—In separate articles we consider trade-unions, friendly societies, etc. In this article we consider simply the ancient labor unions and the medieval guilds.

I. ANCIENT LABOR UNIONS.

That labor unions have existed all through history has long been known, but only recently have they been carefully studied. Particularly in America has Mr. C. Osborne Ward investigated the subject in his *The Ancient Lowly*, reaching conclusions by no means always accepted by all scholars, yet at least collecting valuable information. According to Mr. Ward, in the beginnings of society the family consisted of some strong man or bully and a few women, attracted to him by hope of protection, by lust, or perhaps captured, and beyond these their children and perhaps a few slaves. There being no law, the strong man, or *puterfamilias*, was a despot. When he died the oldest son usually took his place; but the shades of the father and of his fathers were still regarded as present and worshiped. (See FAMILY.) But some of the younger sons would rebel. These were not slaves, but of the same blood as the head of the family. Out of this division, according to Mr. Ward, came classes—the aristocrats, or heads of families, and the dispossessed freemen who were not slaves. These developed the artisan classes, and when they united, the first labor unions. These unions were connected with a religious culte. As the aristocrats worshiped the shades of their ancestors, and made that worship the center of the family, so the labor unions found their patron gods.

The date of the earliest labor organization cannot be fixed; but it must have been very early. As early as 1180 B.C., according to Plutarch's *Theseus*, one Menestheus rose against the aristocrats at

History. Athens to demand for the people the right to be initiated into the Eleusinian mysteries. There must have been at least some understanding between working men at this time, and one of their first grievances was that they were excluded from the aristocratic religious rites, the aristocrats teaching that working men had no souls. A fragment from the age of Solon shows that in his time (about 600 B.C.) trade-unions were common (Granian's *Histoire des classes ouvrières*, pp. 283-287). The celebrated Roman Law of the Twelve Tables specified the manner of organization of working men, and is declared by

some (Gaius' *Digest*; Plutarch's *Numa*) to be a translation from the Greek law of Solon; and the law of Solon is said to be a paraphrase of the still more ancient law of Amasis, King of Egypt. References are found by some to trade-unions in the Bible, in the time of Joshua (1537-1427), and certainly in the time of Solomon. Hiram of Tyre, who is said to have been the architect of the Temple at Jerusalem, brought with him from Tyre 3200 foremen and 40,000 free artificers—not a large number, when it took the immortal Phideas, Calligrates, the chief architect Ictinus, and probably 50,000 unionist craftsmen 10 years to design and complete the Parthenon—the perfection of architectural art.

By the time of Numa Pompilius we find unions fully developed and recognized by law. (See Plutarch's *Numa*.) Mommsen (*De Coll. and Sodal. Rom.*, p. 78) says: "The relics of innumerable communal associations of ancient times are seen scattered all through Italy, as found among the inscriptions of the Italian towns." Down to B.C. 58 of the times of the emperors, the right of working men in Rome to organize was unabridged. Numa divided the unions into eight great classes, a clear witness to their number.

Later, the unions became innumerable. Ward describes a great number both Greek and Roman. The source of our knowledge of these is mainly from inscriptions, tablets, columns, and mutilated manuscripts. Most of the historians were too aristocratic to notice labor organizations, and, according to Ward, the references they did make to uprisings of slaves and laborers were mutilated by aristocrats.

The early Greek unions were called *thiasotai* (or disciples of mutual love), *sussitai* (or those who eat at a common table), *omotaphoi* (or burial societies). According to Ward, the *hetaroi* and *hetarai* were male and female associates of labor societies, and only later was the word used for prostitutes, because laborers were despised. Ward mentions especially the Greek *thiasoi* and *eranoi* as general names for Greek guilds. Of the Roman organizations we have fuller information. The *Fabri navium*, or ship carpenters and boat-makers of the Tiber; the *collegium vasculariorum* (metal vessel makers); the *collegium pistorum* (millers); the *collegium incendiarium* (firemen); the *collegium vinariorum* (wine dealers); even the *collegium lupanarium* (brothel keepers); the *collegium biselliariorum* (makers of chairs for the gods); the *collegium centonariorum* (rag-pickers or junkmen); the *collegium saliarium baxiarum* (shoemakers); the *fullonum sodalicum* (fullers); the *corpus nemesiacorum* (fortune-tellers); the *collegium armatorum* (gladiators); the *communio minorum* (actors); the *collegium castrrensialiorum* (sutlers); the *collegium vinatorum* (planters); the *collegium farnariorum* (mowers); the *collegium urinatorum* (devils), and a long list of others too numerous to mention.

Names.

These *collegia* seem to have been scattered all over the Roman Empire, in Asia Minor, the Greek islands, Spain and Gaul, as well as in Greece and Rome. Mr. Ward says they were established in England by the Romans, and gave rise to the medieval guilds (*g.v.*), especially in Kent, whence "the men of Kent" have brought the labor movement to America.

All these unions were more or less combinations of religious societies, burial societies, convivial societies, and friendly societies, with dues and benefits. Each organization took some patron god and celebrated his worship. They had banners and processions and days of wor-

ship. This was partly to cover their meeting for other purposes. They had occasional or regular convivial meetings, and suppers in common, and their dues were sometimes simply to meet the expense of these. Almost invariably they were burial societies with dues to meet the expense of the burial, of which the ancients made so much. Sometimes they were trade-unions and friendly societies in the modern sense. They had fixed prayers and a ritual for the conduct of their meetings. Their officers were usually presiding officers (of both sexes), a "president of finance," a stewardess or housewife, a manager or trustee, a recording secretary or scribe, lawyers to defend the members, priests to conduct the religious rites.

Some of the inscriptions give the best picture of their organization. A Greek one, in plain Attic Greek (translated in the *Revue Archéologique*) reads: "Because of rutable and just administration of the common fund of money of the community of *eranistai*, and having ever conducted himself with kindness and with honesty; and because he has righteously husbanded the funds successively paid by the *eranistai* themselves, as well as the annual subscription, according to the law of the *eranas*, and in

**Organi-
zation.**

view of the fact that in everything else he still continues to show integrity to the oath which he swore to the *eranistai*, therefore hail Alcmeeon. The community of the *eranistai* rejoice to praise Alcmeeon, son of Thon, a stranger who has been naturalized—their president of finance, and do crown him with a chaplet of foliage because of his faithfulness and good will to them. They are, moreover, rejoiced, and praise the trustees, and also the priests (chaplains) of Jupiter the Savior, and of Hercules, and of the Savior of the Gods. And they crown each of them with the wreath of honor because of their virtue, and their lively interest in the community of the *eranistai*."

The stone is broken and the date is gone, but it seems to be of the Aristotelian period.

That these unions were very much like modern trade-unions, and even in advance of many present unions, is seen by the following inscription, discovered at Pompeii, showing that they endeavored to influence politics, and that they honored women (Ward's translation).

1. "The members of the Fishermen's Union nominate Popedius Rufus for member of the Board of Public Works."
2. "The International Gold Workers' Association of the City of Pompeii demand for Member of the Board of Public Works Cuspis Pansa."
3. "Verna, the home born, with her pupils in all right, put Mrs. Capella to the front for a seat on the Board of Magistrates."

To these unions Ward ascribes great influence in ancient times. Socrates, he says, was a member of them; and his last words as he lay dying was to remind his disciples that they (the *thiasotai* or brethren) owed their cook for a chicken on which they had banqueted. Southern Italy was most full of these unions, where Plato found a system of communisms supposed to have been founded by Pythagoras. Jesus Christ, Ward believes to have belonged to such a union, and to simply have proclaimed successfully to the

world the brotherhood and equality which the unions had long preached and striven for in private. The early Christian churches, he says, were first developed where these unions were strong, as at Pergamus, Laodicea, Ephesus, and Hierapolis ("the seven churches"), Antioch, Rhodes, and elsewhere. Many of these unions doubtless became corrupt; their feasts became feasts of revelry and dissipation; but originally, according to Ward, the Bacchic festivities, the Bacchanalia and Saturnalia, were not licentious. Ancient authors despised these workmen, even Aristotle, and especially Plato (*g.v.*), and therefore have given the names of their organizations a bad repute, which they do not deserve.

These unions were almost exclusively of free working men, tho occasionally slaves were admitted. But the condition of the slaves was terrible in the extreme. At Sparta Lycurgus instituted a communism, but it rested on slavery of the helots. There were common tables, but they were waited upon by nearly naked slaves. The slaves were State slaves, and were flogged once a day. The young *ephori* were taught to hunt for the helots and kill them as they toiled in the fields, in order to keep the helot class in subjection. Two thousand helots are known to have been killed in the fields at one time. At Athens slaves worked the State mines at Laurium and elsewhere, both sexes working naked in the mines under the lash, and loaded with chains. In Rome they were made to fight each other and wild beasts in the arena. In Sicily they were housed in dungeons, compelled to work naked in the fields, beaten, tortured, crucified.

Slaves.

Hence arose great slave strikes. The earliest in Greece was probably a rising of the Spartan helots, which was put down in cold blood in the time of Agis I. (about 1055 B.C.). During the Peloponnesian wars there was a great strike of the 20,000 Athenian slaves at Sunium, who went over in a body to the enemy, Sparta (413 B.C.). Another strike seems to have occurred at the same place, B.C. 133, when 1000 slave miners killed their overseers and rushed into the town and temple for security, but were finally overpowered. According to Livy (*Annales*, lib. IV., 45), the slaves rose in Rome 407 B.C., and tried to fire the city, but were betrayed and the ringleaders crucified. B.C. 194, the slaves rose in Latium and gained the city, but were again betrayed to forces marching from Rome, and some 2000 were slaughtered (Livy, XXXII., *Epitomy*). B.C. 196, another great strike seems to have taken place in Etruria, and another in Apulia, B.C. 185-184 (Livy, XXXIX.). In the island of Chios the slaves rose at an uncertain date, and, under Drimakos, a soothsayer, escaped to the mountains and maintained independence there under their slave king. But finally, according to the story, the *Chiot*s, offering a great reward for Drimakos' head, the old man called a boy friend to him and had him cut off his head to get the reward, which the youth did, a temple afterward being built to Drimakos. In Sicily, under Eunus, 143-133 B.C., the slaves rose and conquered their masters and chose Eunus king, and finally had a force of 200,000 men, defeat-

**Slave
Revolts.**

ing army after army sent against them from Rome during a period of six years. In Pergamus, in Asia Minor (b.c. 130), King Attalus willed his empire to Rome; but Aristonicus, a natural brother, roused the slaves, and offered them their freedom if they would support him. He, with his *eranoi*, defied Rome and defeated her consular armies, till finally overthrown by M. Paperna (b.c. 104). Another great slave rising took place in Sicily under Athenion, who united with the free workmen and defeated Rome in six great battles. The rising of the gladiators under Spartacus is better known. Spartacus at Capua plotted his escape with 200 gladiators, 74 b.c. Gaining weapons, they attracted slaves and working men to them till they had ultimately an army of 300,000 men. He defeated army after army of the Romans by shrewd tactics and desperate valor, but finally was conquered by Crassus, Spartacus himself perishing in the battle; 60,000 workmen fell in the battle, and 6000 were crucified by the Romans along the road from Capua to Rome.

II. MEDIEVAL GUILDS.

The medieval guild in one sense doubtless sprang from the ancient labor unions, but in an important sense it did not. Medieval life sprang from Germanic life, adapted to and molded by the Roman civilization it overran. Wherever the Germanic tribes went, in Germany, England, France, Italy, or Spain, they found labor unions, and, as it were, inherited them. Yet is the medieval guild essentially German and not Roman. The Roman guilds were mainly of slaves or of the despised. The medieval guilds were composed essentially of freemen. They were not simply trade-unions.

Some have argued that the medieval guilds sprang from the early common banquets of the Gothic tribes. They more probably sprang from a variety of causes. The name guild is probably derived from the Anglo-Saxon *gylden* or *gildan*, "to pay," since a distinctive feature of all the guilds was the common contribution or assessment. The word at first seems to have been used for any association for any purpose that had contributions to a common fund. "The early guilds," says Professor Seligman, "had no connection with trade or industry." They were largely social, often protective, sometimes political, almost always with a religious spirit. Says Gierke (*Deutsches Genossenschafts-Recht*, p. 227): "The old Germanic guild embraced the whole man and was intended to satisfy all human purposes; it was a union such as exists to-day only in our towns or States; it answered at the same time religious, moral, social, economical, and political purposes."

An important variety of these guilds were the *frith*, or *peace guilds*, sworn communities for the protection of right and the preservation of liberty. Many guilds were formed by and often composed of the clergy. A still larger class were purely social and charitable. There were said to have been as many as 909 guilds in the county of Norfolk alone. Contributions to the common treasury, masses for the living, and funeral rites for the deceased brethren, observance of a mutual char-

ity, and the bathing, feeding, and clothing of 100 poor men, are among the obligations of most of the guilds whose members promised to conduct themselves as righteously as possible, and be of "one heart and of one soul."

These guilds, of one kind or another, extended all over Germanic Europe and endured in most countries till the time of the Reformation. In England, Henry VIII. sequestered the property of the religious guilds. In Denmark and North Germany their property was devoted to the public service.

The most important, however, of all medieval guilds were the *guilds-merchant* and the *craft guilds*. The former came first and grew to great power, becoming often the real municipal corporation of the towns. Gradually, however, the craft guilds gained upon them, and finally replaced them.

III. GUILDS-MERCHANT.

The guilds-merchant in all European countries seem to have been developed about the same time. In England, they are mentioned first in *Doomsday Book*, both knighton-guild and guild-merchant existing at Nottingham. Lincoln is said to have had one during the Danish supremacy, and soon after *Doomsday* they are frequently mentioned in town charters. The drapers' company of Hamburg dates from 1153, and that of the shoemakers of Magdeburg from 1157. Similar associations existed in Milan about the same time.

**Develop-
ment.**

They were common in France in the reign of Louis IX. By the close of the twelfth century they were general throughout Europe. The Hanseatic League, which was practically a league of North German guilds-merchant, and which came to have such power, dates from the thirteenth century. Their charters were essentially monopoly licenses to sell. With the license also went certain privileges and exemptions. Says Professor Seligman, from whose *Two Chapters on the Medieval Guilds of England* we derive much information:

"It was essential for the merchant traveling from town to town, or even trading within the burgh, to be freed from these burdens, and we find accordingly immunities of this kind in almost every case. . . .

"Another privilege that is often mentioned is the *hansa*. What this was is not very clear. The magnificence of the Hanseatic League and its branches in medieval England are well known, and the Steelyard of the hanse-merchants or Easterlings, who were already protected by Æthelstan, became a renowned institution of London. . . . But the term is much older, and occurs frequently in the English charters, probably at first having reference to the privileges of merchants when away from home. For the English had their guilds in foreign ports also. Its meaning, however, soon became equivalent to guild, or the rights of a guild, and in this generic signification it is used all through the later documents. The 'hansa of the guild' thus became a collective name, which included all the usual attributes of a trading corporation."

The constitution of the guilds shows their character. Seligman tells us that "at the head stood the alderman or master, who probably paid something for his position, and at his side were the wardens or stewards, and occasionally other officers, such as *seneschals*, ushers, clerks, deans, and chaplains. Membership was obtained by heredity, purchase, or gift, and frequent mention is made of the seats of the associates, which probably referred to their position at the feasts or the arrangement of the booths in fair-time. The alienation of the seats, whether by sale or gift, was forbidden, and while the sons and sometimes the nephews and daughters of members were admitted

Constitution.

free of all charges, others were obliged to pay an entrance fee and produce two sureties. In the oath that was administered on initiation, the new member pledged himself to conform to the ordinances, to be subject to the same burdens as his fellows, to inform the officials and inhabitants if he discovered any merchant in town who was not a member, and to obey the command of the mayor as well as to maintain the good usages of the city. Peace and good-will between the members were enjoined; provisions of a charitable character, such as alms to the impoverished and visits to the imprisoned, are occasionally found; the morning speeches and periodical banquets were not omitted, and the members were admonished not to forget to drink their guild-merchant, on which festive occasions the officers availed themselves of the opportunity to collect the taxes.¹⁷

The guild merchant was then at the outset a mere company of traders; but the term merchant, which by no means conveyed the same ideas as at present, included not only those that carried on foreign commerce, but petty traders of all kinds, even artisans. The guild, however, in course of time lost its character as a purely private society, and became closely connected with the municipal organization, altho never identical with it. When the towns and boroughs obtained charters, they took care to have it included that the men of the place should also have their guild-merchant. "Guild law" often became the law of the town. But in England and the north of Europe the guilds-merchant, having grown rich and tyrannical, excluded the landless men of the handicrafts; these then uniting among themselves, there arose everywhere by the side of the guilds-merchant the craft guilds, which gained the upper hand on the continent in the struggle for liberty in the thirteenth and fourteenth centuries. In England these companies usually existed side by side with the old town or merchant-guild; until at length their increasing importance caused the decay of the old guilds, and the adoption of these crafts as part of the constitution of the towns (thirteenth to fifteenth century).

In the great cities like London and Florence the guilds-merchant, if organized, never seem to have taken deep hold. The craft guilds seem to have been early organized.

IV. CRAFT GUILDS.

The origin of these craft guilds is more disputed than that of the guilds-merchant. There are three main views. Brentano, in his *Guilds and Trade-Unions*, argues that they were associations of craftsmen to protect themselves from "the abuse of power on the part of the lords of the town, who tried to reduce the free to the dependence of the unfree." There seems, however, little to support this view. Dr. Cunningham (*History of Industry and Commerce*, vol. i., p. 310) says they were "called into being not out of antagonism to existing authorities, but as new institutions, to which special parts of their own duties were delegated by the burgh officers or the local guild-merchant.

Origin.

Professor Ashley (*Introduction to Economic History and Theory*) takes the middle ground that they were self-governing bodies of craftsmen, more or less under municipal control. They are, however, in no case to be identified with modern trade-unions, and tho Brentano

and Mr. George Howell following him have held that modern trade-unions are descended from them, there seems to be no proof of this. The prototype of the modern trade-union is to be sought rather in the journeymen associations that sprang up later, as the craft guilds grow aristocratic and wealthy. The craft guilds were rather guilds of employers. As the guilds-merchant were monopolies in traffic, so the craft guilds were monopolies in production.

The early charters, says Professor Seligman, all contain as a cardinal point the provision that no one should venture to carry on the trade either in the city or suburbs unless a member.

The crafts could thus not be initiated without permission. The towns often assumed the right of recognizing the formation of guilds, which was regarded as a perfectly legitimate exercise of municipal powers. The regulations of the craft were subject to the periodical approval of the municipal officers, and the guilds were formed and recognized as welcome auxiliaries to the means for the enforcement of the market laws. Care, indeed, must be taken not to exaggerate the involuntary character of the unions, for the early rights of the craft guilds were probably, in part at least, the growth of self-assertion. But, above all, the ordinances were the outgrowth of a general medieval policy.

Their constitution resembled that of the guilds-merchant. The unions known by the names of mystery, faculty, trade, fellowship, or (from the fact of possessing particular costumes) livery company, were divided into two or three categories. At the side of the alderman or master, the chief officer, stood

four or six wardens or searchers who possessed the general authority to inspect work and rectify abuses. As in all guilds, the social gatherings, processions, and annual feasts played a great rôle, and we find here and there provisions for the common welfare, assistance to the needy, and the maintenance of a chaplain. But these few ordinances of a charitable character played an exceedingly insignificant part in the constitution of the craft guilds. The true significance of the crafts was economic, not social.

Membership in the guild in the period of their prosperity depended on full citizenship. Non-citizens, whether aliens or simple strangers, enjoyed but a precarious position in medieval England. The qualification of freeman was necessarily relaxed in the case of women, who were also admitted as members, for certain occupations were almost exclusively conducted by them.

But participation in the franchise was not enough. A perfect acquaintance with the details of the trade and the ability to produce good work were in all cases preliminary requisites. In fact, the main provisions of the craft, the very soul of its constitution, were the regulations intended to ensure the excellence of the products and the capacity of the workman. The ordinances almost invariably commence with a recital of the various subterfuges employed by knavish artificers to deceive the public.

The whole character of the craft guild is seen by these regulations to be due to the compulsion of the city authorities rather than to any

philanthropic anxiety on the part of the trades. Carefully ascertained rules as to the exact proportion and quality of the raw materials were prescribed with great minuteness; the mixing of good and bad wares was strictly prohibited, and the greatest care was exercised in the selection of proper tools.

Similar considerations led to the prohibition of night work or sales by candle-light. Said an edict: "The spurriers shall not work after curfew, 'by reason that no man can work so neatly by night as by day,' and especially because many persons 'compass how to practise deception in their work,' and introduce false and cracked iron for tin and put gilt on false copper."

It was imperative on the craftsman to furnish an adequate guarantee of his fitness to join the guild and produce good work. This guarantee consisted in the fact of a previous apprenticeship and the evidence of a good moral character. The apprenticeship continued as a rule for seven years, but was, in itself, an insufficient security. Defective workmanship indeed was generally the effect of fraud, not of inability, and the longest apprenticeship could give no security against fraud.

These regulations were but a part of the whole medieval system. The Middle Ages were a period of customary, not of competitive prices,

Trade System.

and the idea of permitting agreements to be decided by the individual preferences of vendor or purchaser was absolutely foreign to the jurisprudence of the times. The "higgling of the market" was an

impossibility, simply because the laws of the market were not left to the free arbitrament of the contracting parties.

The remaining features of the guild manifest the same dependence on the laws of the realm. The severance of occupations was imposed upon the trades, not spontaneously adopted by them, and the medieval statutes teem with provisions of this nature, as, for instance, that shoemakers shall not be tanners, brewers not be coopers, cordwainers not be curriers, butchers not be cooks, drapers not be "litsters," while a statute of 1363 admonishes all artificers and handicraft people to use only one mystery or occupation.

But the subordination of the guilds to the general laws of the realm constitutes only one half of the explanation. The other half must be sought in the commanding influence of the towns in economic life. All powers of market and social police were from the first massed in the hands of the urban authorities. The guilds developed and were developed by this life. They aided, too, in art (*q. v.*) and religion.

All medieval guilds, as has been said, were largely religious; and Gierke says in his *Deutsches Genossenschafts-Recht* (p. 227): "As a religious community, as a union for worship, which probably the name signifies, every guild had a patron saint, whose name it bore, and by whom its members swore, and an altar of its own, which it maintained. The erection of benevolent institutions, perpetual masses, and similar gifts to the church, the giving of alms and the assistance of pilgrims, the maintenance of altar lights, and other pious acts

were matters of the union and among its purposes."

Without the guilds the cathedrals would not have been built. As Lowell says in his *Cathedral*:

"I gaze round on the windows, pride of France,
Each the bright gift of some mechanic guild
Who loved their city and thought gold well spent
To make her beautiful with piety."

Says Mr. J. Bleecker Miller: "That was a time when the *Cathedral* system was the religious organization of a great city, with its centralized government under one head, its chapter of priests who attended to the religious wants of the city as a whole, and with the citizens divided according to their trades and professions into smaller religious and political communities, called guilds."

The guilds did much for charity. A brother of the craft would give house and lands to better the annual feast, which the craft always held; or he might found a school, a hospital, or an almshouse, and after defining the amount of his benefaction, would leave the surplus, if any, to the discretion of the guild. Or he would make the guild the trustees of the fund, from which the mass priest should receive his stipend for spiritual offices, the residue being left to the guild as remuneration for management. Occasionally the corporations bargained for the amount of the spiritual service, and refused to agree to a proposal which might be too costly for the fund to bear. They exacted fees for apprenticeship, for taking up freedom by inheritance or servitude, and more lately for admission into the guild by purchase. Like prudent men, who might be liable to occasional charges, they saved and invested these funds, as also gifts for lending without usury to poorer citizens, for apprenticing poor boys or girls, or for marriage portions, or for widows' pensions, or for the relief of the destitute members of the craft, the first and the most enduring duty of the guild. The guild estates, the chest of the company, its revenues and rents, were, like the endowments of an academical college, at once the support of the fraternity and the means by which the discipline of the order or craft was maintained.

Of their life Seligman says:

"But there was no monopoly or exaggerated exclusiveness. Any one could become apprentice, and the number was limited only by the ability of the master to support them or by considerations of a police nature. The apprentice formed a member of the master's family. For the principles of the law of parent and child were made applicable to a certain extent, and all responsibility for purchases of the apprentices as well as for their behavior were imposed on the masters by city ordinance. From one of the indentures that have been preserved we can obtain a clear view of his position. The apprentice is to keep his master's secrets, do him no injury, nor commit excessive waste on his goods. He is not to frequent taverns, commit fornication or adultery with the housemaids or in town, nor betroth himself without his master's permission. He is not to wear certain garments, play at dice, checkers, or any other unlawful game, but is to conduct himself soberly and piously as a good and faithful servant, or in default to serve double time. The master, on the other hand, agrees to find him in all necessities, food, clothing, bed, and so on, for four years. In the fifth year he finds himself, but receives 20s. and the tools of the trade; and in the sixth year he gets 40s., but finds his own tools. The master agrees on his side to teach him the craft without any concealment. . . .

"The condition of the workmen proper was essentially similar. They were known by the various names of varlet, sergeant, yeoman, garson, bachelor, allowe, and journeyman, and were taken for any stipulated period, altho probably at first engaged by the day, as the last term implies. Restrictions were rarely placed on their number; but the necessities of a small household would in general preclude the master from employing more than a limited number. . . .

"All possible disputes were settled primarily by the wardens, some of whom were in certain crafts chosen from the ranks of the journeymen themselves. If the master refused to give the stipulated wages, the wardens forbade him to work until the obligation should be fulfilled. The journeyman was likewise protected against other exactions on the part of unscrupulous masters, such as attempts to compel him to serve beyond his time or against his will, while a stimulus was given to loyal fidelity by prescribing assistance out of the guild funds in case of illness or misfortune. . . .

"But a conflict of interests was in general unknown. The journeyman always looked forward to the period when he would be admitted to the freedom of the trade. This was a rule not difficult for an expert workman to attain. No insuperable obstacle was thrown into his path. In fact, there was no superabundance of skilled labor at this time. It was a period of supremacy of labor over capital, and the master worked beside."

Naturally, however, there were sporadic cases of disaffection on the part of individual workmen against imagined or perhaps real maltreatment by the master. These cases no doubt existed from the earliest period. Out of them came the journeymen's associations. Thus in 1303, in one of the earliest craft ordinances that we possess, the journeymen cordwainers of London are forbidden to assemble or make any provisions prejudicial to their masters or to the public. (See COMBINATION LAWS.)

But altho this, as well as the similar case of the journeymen weavers in 1362, resembles to a certain degree our modern strike and boycott, it is not indicative of any general banding together of the yeomen against the employers.

At first these associations were simple fraternities of a social character. As on the Continent, they were considered quite harmless and in most cases freely permitted. Sometimes, however, they were prohibited, as tending to weaken the paternal authority of the craftsmen. The "congregations" of the journeymen cordwainers above mentioned were doubtless of this class and continued, for over three quarters of a century later they are again charged with making an illegal fraternity, for which they sought a confirmation from the Pope. The general proclamation of 1383 was, however, not directed especially against such associations, as has been represented. For this forbade conspiracies and combinations of all kinds, and did not mention the workmen at all. Probably the regulation was designed to prevent the recurrence of such riots as had taken place during Wat Tyler's uprising, in 1381. The character of the early journeymen's guilds is shown by their fraternities in Coventry, where the journeymen or young people of various trades, "observing what merry meetings and feasts their masters had, themselves wanted the like pleasure, and did therefore of their own accord assemble together, and for their better conjunction make choice of a master with clerks and officers." But as this was found to be to "the prejudice of the other guilds and disturbance of the city," the mayor and citizens petitioned the king, in 1425, to abolish them.

The journeymen's associations which seem to have been quite common (for the statute of 1402 speaks of "fraternities or guilds of servants" in general) were thus mere social brotherhoods, formed by the young "desirous of merry meetings and feasts." It is not permissible to cite them as proving any conflict between labor and capital at this period. The unions were everywhere confined to the youths, who in turn gradually became masters and were enrolled as full members of the craft-guild proper. But gradually this changed. The guilds became too rich and strong, and were hated.

Says Professor James, in a chapter written for McNeill's *Labor Movement* :

"The complaints about the heartless policy of the guilds began as early as the fifteenth century, and did not die out until the guilds themselves died. During the fifteenth century the abolition of the guilds was demanded on this ground. When Henry III., of France, in 1581, extended the provisions of the guilds to all branches of mechanical industry in France, the parliament refused at first to register the edict. In 1614, the third

Downfall.

estate in France moved the abolition of the guilds; in 1624, a party in the city council of Bremen; in 1669, the Elector of Brandenburg, in the German Parliament, made the same motion. In Prussia, beginning with 1688, a series of laws was adopted looking toward the reformation of the guilds in the direction of greater freedom, and in the interest of a growing industry. But the chief attack upon the old guild system came on its theoretical side from Adam Smith and the French Physiocrats.

"God, said the physiocratic school of economists, made the right to labor the property of every person by giving to every one wants and referring him to labor as a means of satisfying them. This property is the first in order of time, the most holy and the most inalienable. Owing to the restrictions on labor maintained by the guilds, the poor are condemned to protract a precarious existence under the control of the masters, to linger in poverty or to betake themselves and their industry to foreign lands. Just as the whole existing system of law had proceeded from the selfish efforts of privileged classes, who resisted every reform, so in making the regulations in regard to organization of the system of apprentices and journeymen the councilors of the government had always been the employers. They served merely to secure to the masters the labor of the apprentice for a long time at a very low rate of wages or for no wages at all; to keep down the wages of the journeyman and to diminish competition by limiting the number of masters. It is one of the first duties of justice to free those whose only property consists in the skill and strength of their hands from the limitations placed upon them by the guilds."

Justice and economic expediency thus united in demanding the freedom of labor. The same demand for freedom of industry and of contract was made by those interested in the large industry which was now beginning to rise in England. The guild system was in the interest of the small employer, but opposed to the interest of the large employer. The mere requirement that a man should have passed through an apprenticeship, and, on the continent, a journeymanship also, stood in the way of those who wished to utilize their capital.

Thus theory and pecuniary interest united in demanding the abolition of the old system. In France, the old system was abolished in the memorable night of August 4, 1789. (See FRANCE.) In Germany, Prussia, in 1810, was the first to do away with the old system completely. England, under the control of the large capitalists, abolished the apprentice law of 1562 in 1814.

The prohibitions of coalitions of laborers were,

however, left on the statute books. The prohibitions in England were abolished by the law of 1824. In France they were not abolished until 1864; for all Germany not until 1871; for Austria in 1870. Nevertheless, many traces of the mediæval guilds still remain, especially in England. (See LONDON.)

In Scotland, the companies of merchant freemen still exercise great power, and the magistrate next in rank to the mayor (provost) is the dean of the guild. But all these modern city guilds are mainly mere inherited monopolies.

GUISE. See GODIN.

GUNTON, GEORGE, was born in England, but when quite young came to this country, and worked in the factories of Fall River, Mass.

Interested in social studies, he worked his way up till he became a leading writer on economic questions from the eight-hour standpoint. His *Wealth and Progress* appeared in 1887, and is the fullest statement of the eight-hour philosophy, tho not endorsed by most of the eight-hour trade-unionists, on account of Mr. Gunton's opposition to other trade-union demands, and by some of them on account of his advocacy of protection. (See SHORT-HOUR MOVEMENT.) His *Principles of Social Economics* was issued in 1891. He is best known to-day for the Economic School, situated at 34 Union Square, New York City, and as the editor of *Gunton's Magazine* (formerly *The Social Economist*), in which he opposes most propositions looking toward State ownership, or even control of industries. Advocating a gold monometallism, he argues that the best way to aid the cause of labor is through the reduction of the hours of labor. (See SHORT-HOUR MOVEMENT.)

H.

HABEAS CORPUS is a writ issued by a court of law or equity to produce before it the body of a prisoner, that the court may inquire into the cause of imprisonment or detention, with a view to protect the right of personal liberty. Properly speaking, this writ is known in law as *habeas corpus ad subjiciendum*. The term *habeas corpus* is used for it, as its formal commencement, as it is for several other similar legal writs known to English and American law. It rests upon the right wrested from King John in the Magna Charta, that no one may be imprisoned save by due process of legal trial and sentence. It is inserted in Sec. 9 of Art. I. of the United States Constitution, that this right shall not be suspended "unless when in cases of rebellion or invasion the public safety may require it."

HADLEY, ARTHUR TWINING, was born in New Haven, Conn., son of Professor James Hadley, in 1856. He was graduated at Yale in 1876. Studying at the University of Berlin in 1879, he became tutor in 1883, and in 1886 Professor of Political Economy at Yale. In 1885 he was appointed Commissioner of Labor Statistics for Connecticut, and published the reports of 1885 and 1886. He has published *Railroad Transportation, its History and its Laws* (1885), and *Economics* (1896), besides many articles and papers.

HALE, EDWARD EVERETT, was born in Boston, April 3, 1822, son of Nathan Hale, LL.D., and Sarah P. (Everett) Hale. Studying in the Boston Latin School, he was graduated at Harvard College in 1839. He studied theology with Revs. S. K. Lothrop and John G. Palfrey, and was licensed to preach in 1842. Preaching in various churches, he was settled in 1846 as pastor of the Church of the Unity, in Worcester. In 1856 he became pastor of the South Congregational (Unitarian) Church, in Boston, where he still remains. He is even better known

as a leader and often the starter of a marvelous number of philanthropic movements. His *Ten Times One is Ten* led to the establishment of clubs devoted to doing good scattered throughout the world, with a membership of over 50,000. They are called "Harry Wadsworth clubs." They have for their motto, "Look up and not down; look forward and not back; look out and not in; and lend a hand." He has also taken great interest in the Chautauqua and other literary, educational, and reform movements. When the Nationalist and Christian Socialist movements were commenced, Dr. Hale interested himself in them. In 1869 he founded, in connection with the American Unitarian Association, the magazine *Old and New*, which in 1875 was merged into *Scribner's Monthly*. In 1886 he started *Lend a Hand*. His short stories are among his best works, notably *My Double and how he Undid me* (1859), *The Man without a Country* (1863), and *How they Lived in Hampton*—a nationalistic tale written before the days of Nationalism.

HAMILTON, ALEXANDER, was born on the island of Nevis, West Indies, in 1757, the son of a Scotch merchant. Entering a counting house at the age of 12, his abilities induced his friends to secure for him a college education, and he was graduated at Columbia College, New York. At the age of 18 he wrote a series of papers on the relation of the colonies to England, which were at first taken for the production of the statesman Jay. On the outbreak of the war he became a captain of artillery, but soon gained the confidence of Washington and became his aide-de-camp and confidant in 1777. In 1780 he married a daughter of General Schuyler, and became one of New York's leading lawyers.

He was a member of the Continental Congress from 1782-83, and of the Convention of 1787. His perspicacity and power of thought

were remarkable. One of the most abused as well as one of the most lauded of men, he played a leading part in the early history of this country.

In conjunction with Madison, he had the most important share in drafting the Constitution. He was a strong supporter of the federal policy of developing a strong national government, and, along with Jay and Madison, defended the Constitution against all attacks by a series of letters in the *Daily Advertiser* of New York, afterward collected and published under the title of *The Federalist* (*q. v.*). On the establishment of the new Government in 1789, with Washington as President, Hamilton was appointed Secretary of the Treasury. The disorder of the public credit and the deficiency of official accounts of the State treasury rendered this office one of peculiar difficulty. In order to reestablish public credit, he carried, in spite of much opposition, a measure for the funding of the domestic debt, founded a national bank, and rearranged the system of duties. In 1795 he resigned his office and resumed the practice of law in New York. When the war with France broke out in 1798, he was, according to the wish of Washington, made Major-General of the United States Army; and, on the death of Washington, he succeeded to the chief command. When peace was restored, he returned to his civil duties, but became involved in a political quarrel with Aaron Burr. This difference unhappily culminated in a duel, in which Hamilton received a wound, of which he died the following day (July 12, 1804). (See FEDERAL PARTY; CONSTITUTION.)

HARDIE, JAMES KEIR, M.P., was born in Glasgow in 1856. Before he was eight years old he went to work in the coal-pits, and worked at the pick till he was 24, never having a day's schooling. As a boy he descended the pit at 5.45 A.M., and did not ascend again until six o'clock at night. He taught himself to write by holding a white stone over the smoke of a lamp and tracing characters upon the smoke-stained surface with a pin. He eventually became secretary of the Miners' Union in Lanarkshire. It was at this time that Mr. Hardie was first discovered to be a "monster in human form," for on the very day that his election became known a benevolent mine-owner dismissed him and his two young brothers from his employ. Six months after Keir Hardie's dismissal he had organized the Lanarkshire men, and 23,000 miners were paying their levy into the union war-chest.

In 1882 a new sphere of work was opened out. Mr. Hardie took to journalism, and became sub-editor of the *Cumnock News*. At the end of four years the circulation of that journal was quadrupled. During this four years, however, the miners' wages had again fallen for want of efficient organization, and Mr. Hardie was once more asked to come over and help. He did so, and in a very short time those wages were doubled.

In 1888 he received an invitation to stand as parliamentary candidate for Mid-Lanark, but was defeated, gaining experience, however, which led him to found the Scottish Labor Party.

His next move was to favor the eight-hour movement; but the Westham Radical Association approached Mr. Hardie soon afterward with an invitation to fight the next election in their district. For two years and a half Mr. Hardie spoke at street corners and everywhere he could; and when the figures of the poll were published in 1892 he was elected, a crowd of 50,000 people in Stratford Highway watching the returns. The new member was carried shoulder-high to Canning Town—over two miles. In 1893 he was the main leader in founding the Independent Labor Party (*q. v.*).

Mr. Hardie is a man of transparent honesty, with a sincere hatred of all shams and petty, unnecessary formulas. He is one of the most lovable of men, and, in spite of his cloth cap, can give points to many of the British peerage in the matter of good manners. He is editor of the *Labor Leader*, and a frequent contributor to the monthly periodicals.

In the last election Mr. Hardie was defeated, but still holds his ground as a leader of his party. In the autumn of 1895 he paid a brief visit to the United States, speaking in the principal cities.

HARMONISTS, THE.—The name of a religious celibate German sect now established at the communistic village of Economy, Pa. The sect was founded at Wirtemberg by George and Frederick Rapp about 1787, and its adherents are therefore sometimes called Rappists. According to their creed, Adam was created a dual being, as is the Creator. If Adam had been satisfied, he could have increased and brought forth without the aid of woman; but he became discontented, and then the Creator separated his twofold nature, of the female element making woman, and therein consisted the fall of man. They believe that the condition of celibacy is thus most pleasing to God; that in the renewed world man will be restored to his dual condition; that the coming of Christ and the renovation of the world are near at hand; that Jesus was of a dual nature; that Christ taught a community of goods; that ultimately all mankind will find salvation; but that only those who are celibates, and otherwise conform to what they believe to be the commandments of Jesus, will be at once received into the company of Christ and His companions, and that offenders must undergo a probation for purification. The early members were so much harassed by petty persecutions that in 1803 they determined to emigrate, and came to Pennsylvania and Maryland. In 1805 they were firmly and prosperously established at Harmony, Butler County, Pa., where they remained 10 years. Then they migrated to New Harmony, Ind., remaining there until 1824, when they sold their land to Robert Owen, the socialist, and returned to Pennsylvania, establishing themselves at Economy, near Pittsburg. Here they have grown in wealth and decreased in numbers, for they have of late years sought few accessions. There are probably not more than 50 in the neat little village that are members of the community, tho there are besides several hundreds of employees. The German language is still used. They have much property in real estate,

in coal mines, and they control at Beaver Falls what is said to be the largest cutlery manufactory in the country.

There are in the society a few more women than men, but no families. Its employees have wives and children, and live in neat houses with well-kept gardens about them. The members of the society live with and among their employees. They have no separate home life apart from those who labor for them.

The amount of capital invested by the society has been estimated from \$5,000,000 to \$25,000,000. There is no means of finding out the actual sum, for it is one of their tenets to keep no accounts for inspection. Everything is in common, and is controlled by trustees, John S. Duss being now the central power, since the recent death of Father Henrici, for long years the head of the community. The original holding of the community consisted of 1100 acres, upon which the town of Economy is built; but these have been expanded into several thousand, and the well-tilled fields bear splendid crops. There are also steel-works, a bank, iron-works, saw-mills, grist-mills, shoe-shops, a great wine cellar, a dairy, harness-shop, and looms. The form of government of the industries and of the society is patriarchal, and is administered by the two trustees and seven elders.

They have a fine choral society. In the garden back of the central house they have music every evening during the summer. In the winter they have glees, and dancing in a great music hall. On Sunday, in the great meeting-house, the services are more than half musical.

The employees are accorded the same privileges, except that of sharing in the bank account and accumulations, as members of the society. Every one draws from the general warehouse whatever is needed for comfort. In other words, the employees have all the requirements and many of the luxuries of life, besides receiving \$8 a month.

The future of the community is, however, quite uncertain. Decreasing slowly but steadily in numbers, yet with enormous wealth, made principally by investments, it has practically lost its cooperative character, and may become an ordinary corporation.

HARRINGTON, JAMES.—Born 1611; died 1677. The author of *Oceana* was educated at Oxford University. In 1646 he was a personal attendant to Charles I. when he was imprisoned, and attended him at his execution. In 1656 he published the work he is best known by—a political allegory, somewhat in imitation of Plato—in which he depicted an ideal republic named *Oceana*. He was arrested in 1661 on a charge of treason, but was confined without a trial until he finally became insane, and died in 1677. The probable reason of his imprisonment was in his avowed republican opinions.

HARRIS, THOMAS LAKE, was born at Fenny Stratford, England, May 15, 1823. At the age of four he was brought to America by his father, who settled at Utica, N. Y. He was soon compelled to earn his own living, and at 17 began to write for newspapers. Having renounced the Calvinistic faith, in which he was

early trained, he became a Universalist preacher at Minden, N. Y., in 1844. His health failing, he went to Charleston, S. C., but from 1845-47 was pastor of a church in New York City. In 1848, having adopted Swedenborgian views, he organized an Independent Christian Society in New York, but in 1850 joined a community at Mountain Cove, Va. He afterward lectured in many parts of the Union, endeavoring to turn the public interest in spiritualism to what he considered a higher plane of religious thought and life. In 1855 he established the *Herald of Light* to advance his views, and in 1858 visited England and Scotland, where he gained converts. Returning in 1861, he settled in Amenia, N. Y., where several friends gathered around him and formed the "Brotherhood of the New Life." The settlement was afterward removed to Brocton, N. Y., where Lady Oliphant and several Japanese of distinction joined the society, and remained many years. The property was not held in common. Mr. Harris appears to exert a marvelous influence upon men, but he seems to hold all power in his own hands, with the natural results of creating great hostility, deserved or undeserved. Scandalous stories are told of the community; but as all is secret, reliable information is not available. Members, scattered over the world, are said to belong to this unique society. About 1876 Mr. Harris removed to the neighborhood of Los Angeles, Cal., where he lives a retired life. His principal works are *Wisdom of Angels* (1856); *Arcana of Christianity* (1857, 1866); *Modern Spiritualism* (1869); *Millennial Age* (1860). He has also published several volumes of hymns and poems.

HARRISON, FREDERIC, was born in London in 1831, and educated at King's College, London, and at Oxford, where, in 1853, he was elected fellow and tutor. He was admitted to the bar in 1858, and in 1877 was appointed Professor of Jurisprudence and International Law by the Council of Legal Education. He has deeply interested himself in the English labor movement, in 1861 writing important letters to the press defending trade-unionism; later getting trade-unions legalized as friendly societies; writing for the *Beehive* from 1861-77, the principal labor paper of London, etc. He is the chief exponent of the Positivist school, a critic of authority, and a master of English prose. Among his works are: *The Meaning of History, Social Statics, Order and Progress,* and *Oliver Cromwell.*

HEADLAM, STEWART DUCKWORTH, was born at Wavertree, near Liverpool, in 1847, and educated at Walthurst, Eton, and Trinity College, Cambridge. He was curate of St. John's, Drury Lane, from 1870-73; St. Matthew's, Bethnal Green, 1873-78; St. Thomas', Charterhouse, 1880-81; St. Michael's, Shoreditch, 1881-84. Mr. Headlam early interested himself in social problems as a priest of the Church of England, and his parochial duties bringing him in contact with girls and actors on the stage, he defended them from what he believed unwarranted condemnation, and came to believe in and study stage dancing as an art.

A lecture on this subject gave serious offense to the late Bishop of London, and he refused him a license in his diocese, so that Mr. Headlam has worked under great difficulties. Nevertheless, few clergymen in London exert a stronger influence for Christianity and the Church. He has been the leading spirit and the real founder of the Church and Stage Guild, and also of the Guild of St. Matthew (*q.v.*), a Christian socialist society—the first society still existing in England to declare for socialism. He was, till its suspension in 1895, the editor of *The Church Reformer*, the organ of the guild. Mr. Headlam is the author of several small but remarkable volumes of sermons and lectures: *Priestcraft and Progress* (1882); *Lessons from the Cross* (1887); *The Laws of Eternal Life* (1888); *Salvation through Christ*; *Christian Socialism* (1888). He has also edited part of Carlo Blesis's work on dancing, under the title *The Theory of Theatrical Dancing*. He has written essays on *The Function of the Stage*, *The Ballet*, etc. He thus unites the most radical views with a high Anglican Catholicism. He is most popular with the London working men, and has been elected on the London School Board for Hackney, and most actively works as a Fabian socialist for board schools, etc.

HEGEL, GEORG WILHELM FRIEDRICH, was born at Stuttgart in 1770. He studied at Tübingen with Schelling, and became professor at Jena, Heidelberg, and Berlin. His principal works are: *Die Phänomenologie des Geistes* (1807); *the Logik* (1812-16); an *Encyclopædie der Philosoph. Wissenschaften* (1817); *Philosophie des Rechts* (1821). He early in life turned his attention to social questions, writing (1797) a commentary on Stewart's *Inquiry into the Principles of Political Economy*. Later he published various small works on the political constitutions of Würtemberg and Germany, criticising them and admiring Napoleon, "that universal genius." Living in the stirring times of the French Revolution, rejecting the idea of the Absolute, and conceiving of everything, even of God, as an eternal process, he thinks of society as developing through the individual, the family, the town, the State, the world, higher and higher unities, each unity, however, realizing and not destroying the lower unity. It is easy to see how he came to be the intellectual father of Marx and of most early German socialists.

HELD, ADOLF, was born in Würzburg in 1844. He studied in Würzburg and Munich. In 1867 he became teacher, and in 1872 full Professor of Political Economy at Bonn. In 1880 he was called to the university at Berlin, but was drowned on August 25 of the same year. He was prominent as one of the socialists of The Chair (*q.v.*). Among his best-known works are: *Die Einkommensteuer* (1872); *Die deutsche Arbeiterpresse der Gegenwart* (1873); *Grundriss für Vorlesungen über Nationalökonomie* (1876); *Sozialismus Sozialdemokratie und Sozialpolitik* (1878).

HELPERS, ASSOCIATION OF.—An association of men and women organized by W. T.

Stead, the London journalist, who, irrespective of differences of party, creed, or social condition, have agreed to work together for the attainment of certain broadly defined ideals, social, political, and religious. It was founded in January, 1890, immediately after the appearance of the *Review of Reviews*, with its *Address to all English-speaking Folk*. In February, 1892, there were between 500 and 600 Helpers on the list. (See CIVIC CHURCH)

HERBERT, AUBERON EDWARD WILLIAM MOLYNEUX, son of the third earl of Carnarvon, was born in 1838. He left Oxford for the army, serving 18 months in India, but returned and took his degree, and for a year taught at Oxford. He then visited Denmark during the Prussian-Danish War, and the United States during the War of the Rebellion, becoming acquainted in camp with Generals Grant and Meade. His next few years were spent in London aiding working men in clubs. From 1870 to 1874 he was in Parliament for Nottingham. He went to France during the Franco-Prussian War. He left Parliament, coming to believe, with Spencer, that the people needed to reconstruct their own conditions in life and not to depend on politicians. He has thus become an intense individualist, the editor of *Free Life*, the organ of Voluntaryism (*q.v.*), advocating the voluntary state and voluntary taxation. He published *The Right and Wrong of Compulsion by the State* in 1885.

HEREDITY.—The influence of heredity upon character has been very widely discussed. For the position of heredity in the philosophy of evolution, and especially for the view held by Weismann and the majority of modern evolutionists that *acquired* characteristics are not transmitted to posterity, see EVOLUTION. Says Professor R. T. Ely, writing in *The Outlook*, September 16, 1893:

"Many facts have been brought forward in substantiation of this doctrine. The experience in the breeding of lower animals was one which most naturally occurred to those thinking earnestly upon heredity. Various social studies which have been made tend, at first blush, at any rate, to emphasize heredity. All those who have given attention to crime and pauperism in the United States are familiar with the story of the Jukes, so well told by Richard Dugdale. To Margaret, 'the Mother of Criminals,' can be traced numerous pauper and criminal descendants who have, all told, cost the State of New York millions of dollars. The 'Tribe of Ishmael' is the name given in Indiana to the many descendants of two or three persons weak in body, mind, and character. These descendants fill the hospitals and jails in the neighborhood of Indianapolis. A city missionary in Berlin has traced to two sisters, who lived not long ago, paupers, prostitutes, thieves, murderers. The descendants of these two sisters have served hundreds of years in prison. A most remarkable social experiment was conducted in Oneida, N. Y., which, on account of the delicacy of the subject, has never received the scientific attention which it deserves. At this place there was a communistic settlement, composed very largely of able and highly educated men, who attempted to apply strictly scientific principles in the breeding of men. Dr. Ely van de Walker, of New York City, has given some attention to the subject, and he pronounces the result quite remarkable. It is claimed that the children born are far above the average, in their physical qualities at least.

"Further thought appears to bring a reaction in favor of environment. The facts of social parasitism could not be long observed before it became apparent that heredity brings circumstances with it. Are the resulting crime and pauperism due to heredity or to

the circumstances which unfortunate heredity brings in its train, or to both? Experimentation on a considerable scale has given a partial answer. The Children's Aid Society of New York and other similar agencies have changed the circumstances of those whose heredity was unfortunate, and the outcome has been changed character in the vast majority of cases; probably it is safe to say in nine out of ten cases. Thousands of children born of the worst parents have been taken from surroundings in the slums of cities which would have made of them paupers, prostitutes, and criminals, and they have become useful and honorable citizens. With some degree of certainty it can be predicted that the circumstances of the worst slums mean to the child brought up in them ruin, and perhaps with quite as great a degree of certainty it can be predicted that a change to an altogether favorable environment will mean social salvation. If heredity is, in such cases, as it may be admitted, an adverse force which must be overcome, yet favorable circumstances are sufficient to overcome it, and circumstances have by far the greater weight.

"Recent studies of heredity appear also to give less importance to it, on the whole, than earlier ones. It is now frequently asserted by scientists that acquired qualities cannot be transmitted. An English economist says of Weismann, whose essays upon heredity are well known, that he has reopened the case for Socialism. What he means is this: Socialism lays emphasis almost entirely upon circumstances, and Weismann's investigations have so emphasized the importance of circumstances as opposed to heredity that once more the case for Socialism requires discussion before the bar of public opinion."

Dr. H. D. Chapin, in the *Forum* (March, 1894), gives the results of his studies:

Dr. Chapin is a physician to the New York Post-Graduate Hospital, and has made a record of 600 cases that came under his care. His object was to determine how far the diseases of very little children were occasioned by heredity and how far by the conditions in which they lived. Most of the children were under two years of age, and nearly half under one year. At the time of birth, 58 of them were reported to have been in good condition, and only 20 were reported to have been in bad condition. In 12 cases the report was "only fair," and in the remaining cases there was no report. The children as a whole, therefore, seem to have started life well. What, then, had been their environment? It was found that in 106 cases the mothers were the sole bread-earners, and that in 88 cases the fathers were out of work when the children came to the hospital. Besides these there were 176 cases in which the mothers as well as the fathers were obliged to work. The results of this were very striking. "Two hundred and fifty-seven of the cases," says Dr. Chapin, "were deprived of maternal nourishment before the proper time, and 101 of the babies never received it at all. The usual reason was that the mothers were obliged to go out to work and remain away for too long intervals to care properly for their infants. As a direct result, a large number develop rickets, which is usually accompanied by a softening of the bones, together with great irritation of the nervous system. Almost all these diseases could have been prevented by proper diet and care, and yet when brought to the hospital they were frequently so far advanced as to result either in death or in a more or less permanent crippling of a healthy life." The family incomes in nearly half the cases could not be obtained with any definiteness, but in 150 cases they were reported to be between \$5 and \$10 a week, and in 117 cases to be less than \$5. In only 85 cases were they reported to exceed \$10 a week. The large proportion of the families having less than \$5 a week reveals a stratum of society which factory returns show nothing of. With such incomes, insufficient nourishment and unhealthy, overcrowded rooms are inevitable. When families are reduced to these conditions, physical degeneration is likely to destroy the power to rise. "It is evidently time to consider," says Dr. Chapin in conclusion, "whether some reasonable form of cooperation cannot be substituted for the bitter competition so wasteful of human life."

In a recent letter Mr. C. Loring Brace, Secretary of the Children's Aid Society of New York, said:

"So far as we can judge, inheritance does not figure in the problem. . . . This society has placed 84,000

children in homes since it began this work 40 years ago, and it is our experience that no matter what the parents may be, if the child is taken away at an age so early that it has not yet understood the wickedness about, if placed in a country home with kind and judicious adopted parents, it is almost certain to do well. . . . But if the child is not transplanted early enough, then there are the bad examples, bad habits, and knowledge of evil ways to contend against.

"The last word of the scientists is in accord with the words of these practical scientists. The theory of heredity now held by Wallace, who shares with Darwin the credit of the hypothesis of natural selection, and by Weismann and the most eminent authorities, is that acquired characteristics of the parent do not pass to the child by inheritance."

Professor A. G. Warner says (*American Charities*, pp. 119-21):

"The question of heredity is at bottom a biological question; and it is decidedly annoying that, just when we most desire certainty, biologists should be able to supply us with little but controverted speculations. After many books have been written to explain how acquired characteristics are transmitted from parent to offspring, Professor Weismann steps out of his laboratory to deny that we have any proof that they are so transmitted. He defends his denial so shrewdly that the authors of some of the books referred to accept his view of the matter. This doubt pulverizes the foundations of nearly all that has been written of late on heredity, and of an especially large proportion of what has been written on heredity in its bearing on social life and development.

"If acquired characteristics be inherited, then we have a chance permanently to improve the race independently of selection, by seeing to it that individuals acquire characteristics that it is desirable for them to transmit. But Weismann prevents our assuming that, by improving the environment and training the individuals, we can thereby permanently improve the stock. Change of environment and special training affect only the individual; the progeny are uninfluenced by the life history of the parent. We are thus more in the dark than was for a time supposed as to the causes of variation. According to the new theory, those causes are beyond our reach and beyond our knowledge; all that we can do for the improvement of the race is to make the most possible of each individual, and, by some system of rational selection, see to it that the essentially unfit have every facility for becoming extinct. Wallace, who is inclined to think that Weismann's point is proved, suggests that if we were to take two herds of wild horses, and attempt to develop runners from one by selection without training, and from the other by training without selection, there can be no doubt that the former method would be the surest and most expeditious. Some have felt that if acquired characteristics be not inherited, the outlook for the improvement of the human race is very hopeless, since it would seem to be nature's policy to induce variations blindly, and then to weed out those individuals and strains that prove unsatisfactory. A continuous or fortuitous supply of the unfit would constantly be brought to birth only to be exterminated. Suspend the selective processes, and, according to Weismann, the race would not only cease to improve, but would certainly and at once begin to degenerate. Our only hope for the permanent improvement of the human stock would then seem to be through exercising an influence upon the selective processes.*

"With the tendency which now seems to be manifest to think that Weismann has not finally made his point, at least in so far as it applies to heredity among the higher animals, we can return to the earlier, and perhaps more encouraging view, if we will; but, at the same time, the illustration suggested by Wallace must convince us that selection is a far more important factor in race improvement than the training which can be given by the most carefully adjusted environment. At the present time perhaps the best working hypothesis is to assume that Weismann is right, but remember that whatever environment cannot do for the race, it is conceded that it is unquestionably in the highest degree important for the individual. Weismann himself shows that many of the resem-

* Kidd's *Social Evolution* is based on the hypothesis that Weismann's opinions on this point are correct; all of Spencer's social philosophy is based on the opposite assumption.

blances of children to parents, which we have attributed to heredity, are merely the result of early environment on offspring. . . . To assume Weismann to be right—acquired characteristics to be not transmitted—is possibly the safest working hypothesis, because, on the one hand, it does not limit our efforts to improve environment, while, on the other hand, it gives us a sharp realization of the importance of selection, a factor which we are prone to forget or to undervalue." (See EVOLUTION.)

HERRON, REV. GEORGE, was born at Montezuma, Ind., in 1862. Of feeble health as a child, he grew up in the closest communion with a father and mother of humble life, but of unusual Christian character and devotion in the evangelical faith. The "kingdom of God was to him from his earliest years a tremendous reality." He is to a large extent a self-educated man. Entering the Congregational ministry, he early developed deep interest in social matters. In 1891 he read a paper called *The Message of Jesus to Men of Wealth*. It was published in the *Christian Union*, and later as a booklet, and immediately arrested very wide attention. In 1891 he was called to the pastorate of the Congregational Church at Burlington, Ia., and aroused the deepest interest in social problems among men and women of all classes. He conducted a retreat at Grinnell in 1892, and in 1893 he was chosen to the professorship in the Rand chair of Applied Christianity, established at that time in Iowa College, at Grinnell. Since then he has preached and lectured on social Christianity to audiences, classes, and summer gatherings from Massachusetts to California, everywhere creating a profound impression. He is first of all a preacher of righteousness, a profound believer in the Gospel of the kingdom as the Gospel of the present day, which he believes to be a crisis in the history of Christianity, as well as of the country, and to the preaching of which Dr. Herron devotes himself with the conviction, the fearlessness, and the consecration of an apostle. He has written numerous small books; among them are: *The Larger Christ* (1891); *The Call of the Cross* (1892); *A Plea for the Gospel* (1892); *The New Redemption* (1893); *The Christian Society* (1894); *The Christian State* (1895); *Social Meanings of Religious Experiences* (1896).

HERTZEN, ALEXANDER, was born in Moscow, Russia, in 1812. Shortly after completing his education he was imprisoned for his outspoken views and banished to Viatka and Vladimir. On his return he devoted himself to literature, and in 1842 his *Dilettantism v. Naukie* attracted attention. In the same year, for criticising the police, he was ordered to live in Novgorod. In 1847 he obtained permission to travel, and in 1851 set up in London a *Free Russian Press* to attack the Government and issue works forbidden in Russia, notably *Kólokol* (*The Bell*), started in 1857. Thousands of copies were smuggled into Russia and read by all, from the emperor to the peasants. After sympathizing with the Poles in their insurrection of 1863, he transferred the *Kólokol* to Geneva, where it had an obscure existence till about a year before Herten's death in Paris in 1870. He was romantic and skeptical, eloquent and satirical. He wrote various books and

stories, his complete works being published in Basle in 1875.

HERTZKA, THEODORE, was born in Buda Pesth in 1845, and studied in Vienna. In 1872 he was editor of the *Neue Freien Presse*; in 1880 superintendent of the *Wiener Allgemeinen Zeitung*. The same year he brought out his *Die Gesetze der Handelspolitik* (*Laws of Trade*), from the standpoint of the orthodox economy, which, however, he wholly gave up six years later in his *Die Gesetze der Sozialen Entwicklung* (*Laws of Social Evolution*). A still further advance is made in his utopia of *Freiland* (1890), in which he pictures a colony in equatorial Africa on the principles of communism. At the end of this volume he called for the creation of such a colony, and met with a large response. By 1891 the book had been translated into many languages, and some 1000 local unions had been formed to provide the means and start the colony. A central committee was organized, and in 1893 a start actually made. At the last, however, the difficulties were too great, and the plan failed. Most socialists believe that socialism must come in through evolution, not through colonies.

HIGGINSON, THOMAS WENTWORTH, was born in Cambridge in 1823, and was graduated from Harvard in 1841. Settled as pastor of the First Church in Newburyport, but dismissed in 1847 because of his anti-slavery preaching, he organized the Free Church in Worcester, where he remained nearly six years, an enthusiastic worker against slavery and the intimate friend of Garrison and Phillips. He enlisted in the war in 1862, and served till seriously wounded in 1863. He was appointed colonel of the first regiment of colored troops enlisted in South Carolina. His great work, however, has been as essayist, author, poet, lecturer, and novelist. Some of his best writings have been his short essays contributed to *Harper's Bazar*. His lecture, *The Aristocracy of the Dollar*, gave him a national reputation. His devotion to the cause of humanity led him to especially espouse the cause of the slave, and since then of woman emancipation from intellectual and political subjection. He was one of the first interested in Nationalism, tho not fully indorsing its views. Living in Cambridge, Mass., he is prominent in public affairs and reform movements.

HIGH LICENSE may be defined as a license to sell liquors granted at what is regarded as high rates, and intended thereby to reduce the number and improve the character of the places licensed. Many advocates of the high-license program claim that the term has a wider meaning, and also covers accessory restrictions of all kinds—that it is merely a convenient generic name for all "improved" license acts. High license provisions are invariably accompanied by certain restrictions or prohibitions governing the manner of sales; but such restrictions and prohibitions are incidental to all license laws, and the high-license idea derives its special significance not from the restrictive principle proper—*i. e.*, the principle of absolute-

ly prohibiting sales to certain persons during certain hours and in certain places—but from the tax or revenue principle—*i. e.*, the principle of taxing the traffic as for the present at least a "necessary evil"—taxing it to the maximum attainable point, and drawing from it for the public funds the maximum amount of revenue. The high-license plan was not urged with any activity in the early years of the temperance agitation in the United States.

The high-license movement, as a feature of the temperance agitation, came into existence at about the same time that the constitutional prohibition idea attained prominence. Preparation for it had been

History.

made by a gradual raising of the license rates in many States. Up to 1880, however, a rate of \$200 per year was considered high. The high-license crusade dates from the enactment of the Nebraska "Slocumb" law in February, 1881. It fixed minimum annual fees of \$500 for saloons in all towns having less than 10,000 population, and \$1000 in those containing more than 10,000 inhabitants, and established numerous restrictions of a very rigid nature. The enactment of the Downing law of Missouri followed in March, 1883, fixing the yearly license charges at \$50 to \$200 for State purposes, and \$50 to \$800 for county purposes—a minimum of \$550 and a maximum of \$1000. In the same year (in June) the Illinois Legislature passed the Harper law, under which minimum rates of \$500 for the sale of all kinds of liquors and \$150 for the sale of malt liquors only were fixed. Since then many of the other license States have required the saloon-keepers to pay relatively large sums—notably Massachusetts, where the minimum license rate for the ordinary saloon selling all kinds of liquors for consumption on and off the premises is now \$1300 per year; Minnesota, where the minimum rates are \$500 for towns and \$1000 for cities; Pennsylvania, where the uniform rate for each city is \$500; the new State of Montana, where \$500 is charged in towns having 3500 inhabitants or more; the Territory of Utah, where the minimum charge is \$600 and the maximum \$1200, and several Southern States, like Arkansas, Texas, and West Virginia, where the aggregate fees exacted range from \$500 upward.

The first high license legislation undeniably originated with thoroughly radical temperance men, believers in the principle of Prohibition, who honestly thought they were making a serious attack upon the traffic. The framers of the Nebraska act were John B. Finch, H. W. Hardy, and other temperance leaders equally earnest. The Missouri law was passed as a compromise measure, to defeat the prohibitory bill pressed by John A. Brooks and his aggressive followers; but it was looked upon by many as an important step in the direction of prohibition. It was several years before the high license program was regarded with decided suspicion by the prohibitionists; but by 1886 a general distrust was felt, and ever since then active hostility has been manifested. Opposition to high license is now as much a part of the prohibition creed as opposition to the saloon itself.

The arguments in favor of high license are

various. Its supporters claim, first, that in the present state of society, especially in the larger cities, it reduces drinking and the number of saloons far more than prohibition or any other system now possible, the drinking of wine and intoxicants being, as most adherents of high license hold, not a sin *per se*, like prostitution, but only an evil when carried to excess; or if an evil in its beginnings simply so because it leads the drinker or other drinkers to go on to drinking in excess; it is argued that it is not immoral to license drinking, if this be the best way to promote temperance. This the adherents of high license claim. They say that in the present state of the community, especially in our large cities, with our numerous foreign inhabitants, who are accustomed to the use of wine and beer, and who consider them innocent as water, it is not possible to sustain a prohibitory law, and therefore that in practice prohibition here means approximately free rum. They point out that in places the liquor interest has worked with prohibitionists to enact a prohibitory law, knowing that such a law could not be enforced. They point out that Massachusetts, Rhode Island, and Connecticut have all tried prohibition and given it up, it being claimed that prohibition increased the number of saloons and amount of drinking.

Dr. Ernest H. Crosby says:

"The Metropolitan Excise Law, which was passed by the Legislature of New York on April 14, 1866, affords an excellent example of increased revenue produced by increased fees. At this time there were 9720 saloons in New York and Brooklyn, less than one fourth of them being in the latter city. . . . Under the new law the Metropolitan Board of Health fixed the licenses at \$250 and \$100. At the expiration of 11 months there were only 6779 licensed places in the metropolitan district, of which 5203 were in New York and 1476 in Brooklyn. In New York the sum of \$993,379 was collected in license fees, and in Brooklyn \$257,725. . . . In 31 months New York contributed over \$3,000,000. This law was repealed during the supremacy of the Tweed ring" (*North American Review*, vol. 144, p. 501).

Dr. Crosby, also in the same article, gives the following facts:

The Illinois high license law went into effect in 1883. It closed several hundred saloons in Illinois, and raised the revenue from \$700,000 to \$4,500,000. Michigan, in 1875, under prohibition had 6444 saloons; in 1876, under regulation, 1577 were blotted out, and by 1882 there were only 3461. In Missouri, Governor Marmaduke said in his message to the Legislature, January, 1887: "Prior to the enactment and enforcement of the law providing for what is known as high license for dram-shops, there were in this State 3601 dram-shops and other places where ardent spirits were sold to be used as a beverage, yielding a revenue of \$547,320. There were, on July 4, last, 2880 such dram-shops, yielding a revenue of \$1,842,208." Of Ohio, Governor Foraker says: "The most reliable data obtainable indicate that the tax law has suppressed a large percentage of the saloons."

A second argument in favor of high license is that by lessening the saloons it becomes possible to inspect and control the traffic, closing saloons as may be voted on Sundays and at certain hours, and forbidding the sale to minors, etc. This is not possible, they urge, under prohibitory laws, which, not being enforced, both allow the grossest evils and accustom the community to non-obedience to law. There is no

Argument
for
High
License.

use, they urge, in legislating far beyond the average moral sense of a community.

The third argument is that high license does bring in large revenues, and so enables governments to meet the frightful expenses entailed by the traffic in caring for the poor or punishing the criminal, thus making the traffic pay for its own evils. Prohibition, they argue, creates more drinking and less ability to meet the evil.

Other claims made for high license are that it will operate to exterminate the most objectionable saloons; that it will confine the traffic to men of responsibility, and therefore, presumably, to men of better character; that by diminishing the aggregate number of liquor dealers, it will diminish the temptations to the drinker, and consequently reduce the consumption of drink; that it will remove from political warfare the organized power of the more dangerous, demonstrative, ignorant, and offensive rum element that is seen in active and constant operation so long as the laws bestow upon it the right to exist; that by entrusting a comparatively few responsible men, under rigid conditions, with the privilege of selling liquor—that privilege to be purchased at a high money price and to be cancelled in case of violations of the law—the cooperation of these privileged licensees will be commanded by the authorities in their efforts to enforce wholesome restrictions and to suppress unlicensed establishments; that the first restriction of the liquor traffic by high license will make it comparatively easy to bring about a second and greater restriction, to be followed in time by more radical restrictions, until the whole traffic is "taxed to death" and thus extinguished by progressive action instead of by a sudden (and not necessarily permanent) sentimental decree; that, meanwhile, the liquor traffic will be under the severest stigma attaching to any trade, and be pronounced by law to be so dangerous to the community as to require restriction at all points and the payment of enormous sums to the Government.

The opponents of high license deny that it does lessen drinking, even tho it may lessen saloons. They say that it makes drinking respectable and legal, and so encourages it. Poor people, they argue,

Objections.

feel the injustice of making license a matter of money, and so keep up kitchen bars, etc. The fact that high license does bring in revenue its opponents consider almost its worst feature, since it interests the community in maintaining the evil traffic, and so, instead of high license leading to prohibition, it is considered by prohibitionists as among their worst foes. The (prohibition) *Encyclopedia of Temperance* tabulates the statistics of 41 high license and 38 low license cities, and draws the following conclusions:

1. The license fee is five times as great in the 41 high license cities as in the 38 low license cities, and the number of saloons is only about one third as great.

2. Yet there is but very little difference in the number of arrests in ratio to population in the high license and the low license cities.

3. The ratio of arrests for drunkenness and disorder to the total arrests is noticeably greater in the high license than in the low license cities.

Of Chicago it gives the following figures:

YEAR.	Saloon License Fee.	Total Arrests.	Arrests for Drunkenness and Disorderly Conduct.	Arrests of Minors.
1880	\$52	28,480	6,144
1881	52	31,713	6,753
1882	52	32,800	7,199
1883	103	37,137	18,045	6,675
1884	150-500*	39,434	21,416	6,718
1885	150-500*	40,998	23,080	6,550
1886	500	44,261	25,407	6,841
1887	500	46,505	26,067	7,539
1888	500	50,432	31,164	8,923

The main argument of the prohibitionists against high license, however, is that it commits the State to a license of the drink evil, and gives it an interest in the ruin of its citizens, and thus demoralizes both the Government and the community and puts back the advance of temperance.

HILDEBRAND, BRUNO, was born at Naumburg, Prussia, in 1812. Studying philosophy, he was implicated in the affair of the *Burschenschaften* (corporations of students suspected of liberalism); he succeeded, however, in being appointed Professor Extraordinary in the University of Breslau, then Titular Professor of Political Science at Marburg (1841), where he published some years later (1848) the first volume of *Die Nationalökonomie der Gegenwart und Zukunft*. He was the same year chosen deputy from Marburg to the National Assembly at Frankfort, and his attitude was so hostile to the Government that he was exiled to Switzerland. At Zurich he was appointed Professor of Political Economy. He had already created at Marburg a bank for widows (*Wittwen casse*); and he founded at Berne the savings and loan bank. After he left Zurich (1861) he occupied the chair at Jena (1862), and in 1862 founded the *Jahrbücher für Nationalökonomie und Statistik*. After 1873 he edited this journal in connection with Conrad, his son-in-law. He died at Jena January 29, 1878, a leader in the historical school (*q.v.*). (For his economic position, see POLITICAL ECONOMY; GERMANY.)

HILL BANKING SYSTEM, THE, was originated by Mr. Thomas E. Hill, a Chicago capitalist.

It demands absolute ownership and control of all banks by the Government, and consequent prevention of bank failures. The money with which to do banking is to be obtained from the people. To induce people to bring into circulation the hundreds of millions now hoarded in safety deposit vaults and other hiding-places, 3 per cent. interest is to be paid on long-time deposits.

* \$150 for beer and \$500 for strong liquors.

Three thousand bank depositories are to be established throughout the United States, from which money is to be loaned at 4 per cent.

Every post-office is to be made a receiving bank where money can be deposited, thus giving over 65,000 banks of deposit.

The \$1,500,000,000 in sight, and the hundreds of millions, now hidden, which will come into the banks will increase the Government's banking capital to \$2,000,000,000.

Appropriating \$20,000 per year for the management of each bank will make the cost for the distribution of money \$60,000,000. Allowing 3 per cent. interest on \$2,000,000,000 will be \$60,000,000; hence the total annual expense to the Government for the distribution of its funds and interest will be but \$120,000,000.

As all money loaned comes immediately back to the absolutely safe bank, it can be loaned over and over. If loaned up to \$5,000,000,000 at 4 per cent., the annual income will be \$200,000,000, a profit to the Government of \$80,000,000 per year. If loaned over four times, up to \$8,000,000,000, charging only 2 per cent. interest to borrowers, the annual profit to the Government would be \$40,000,000.

The Hill banking system makes the people the owners of all banks, and uses the people's money for banking.

How, some will ask, can the Government pay 3 per cent. and loan at 3 per cent.? The system here outlined proposes to pay interest to long-time depositors only. To business men and all those who have open accounts no interest is paid. Thus, when one person deposits money not to be removed for a long time, more than one hundred times this amount will be deposited by business men, who frequently borrow, paying interest on their loans, while they receive no interest on their deposits. The system starts on a sound conservative basis, borrows at 3 per cent., loans at 4 per cent., divides the profits with the people, and through a system of active accounts and many loans will reduce the rates to an almost incredibly low per cent.

One of the chief advantages of the Hill plan is that it fits immediately into the present methods of doing business, creating no great change in existing financial arrangements except a general lowering of interest and a vastly wider distribution of money which will start many enterprises into activity, enabling money-loaners to employ their means to as good advantage for themselves as the lending of money.

HILL, OCTAVIA, is widely known in social reform movements for her successful work in rent collecting in London, making this work an opportunity for aiding those from whom the rent is collected in cleansing and improving their tenements. Commenced as an experiment, it has grown till Miss Hill and her assistants are said to care for some 5000 dwellings. (See article TENEMENTS, Sec. 3.)

HILL, SIR ROWLAND, was born at Kidderminster in 1795. After his own education he taught in his father's school till 1833. He then joined the association for establishing the colony of South Australia on Mr. Wakefield's scheme of colonization (see AUSTRALIA), and be-

came secretary to the royal commission on the colony. In 1837 he published his famous pamphlet advocating cheap and uniform postage. In 1840 a uniform rate of 4d. per letter was adopted, soon after reduced to 1d. Mr. Hill was placed in the treasury to work out his plan, but was soon dismissed by a Tory government which came into power. In 1846, however, the Whigs returned to power, and Mr. Hill was made secretary to the postmaster, and in 1854 secretary to the post office, an appointment he held till failing health compelled him to resign in 1864.

HINTON, RICHARD J., was born in London, England, in 1830, and educated mainly at a mechanics' institute. He came to the United States in 1851, and became a printer and reporter. He became an ardent abolitionist, and went to Kansas as a newspaper correspondent in the times of the John Brown agitation. He studied and was graduated as a topographical engineer in New York City in 1855. During the war he served nearly four years in the Union armies. After the war he was a correspondent at Washington and in Europe, writing on social reform topics. From 1867 he was representative for the United States in the International Working Men's Association. He has since made investigations and written reports on various industrial and economic subjects for the Government, including extensive reports on Western irrigation. Identified with various reforms, he has written various biographies of abolitionists, two military histories, etc.

HISTORICAL SCHOOL.—A school of political economists which arose in Germany, in reaction from the theorizing of the English school of *laissez faire* as developed in Ricardo and his followers. Most economists rightly object to being classed in this or any other "school," preferring to be catholic in their views and unaffiliated by designation of belonging to any school. Yet this school has many sympathizers. The school is in the main inductive, where the Ricardian economy is deductive. It owes its rise very largely to the influence of Comte and the Positivists.

Roscher, Bruno, Hildebrand, and Karl Knies may be said to be its four German founders. (See their names.) The school has always had a marked leaning toward State socialism in reaction from individualism. Says Professor Ingram (*History of Political Economy*, p. 207):

"The historical method has exhibited its essential features more fully in the hands of the younger generation of scientific economists in Germany, among whom may be reckoned Lujo Brentano, Adolf Held, Erwin Nasse, Gustav Schmoller, H. Rösler, Albert Schäffle, Hans von Seeel, Gustav Schönberg, and Adolf Wagner. Besides the general principle of an historical treatment of the science, the leading ideas which have been most strongly insisted on by this school are the following: 1. The necessity of accentuating the moral element in economic study. This consideration has been urged with special emphasis by Schmoller in his *Grundfragen* (1875) and by Schäffle in his *Das gesellschaftliche System der menschlichen Wirtschaft* (3d ed., 1873)."

Two other ideas which Professor Ingram considers prominent in the historical school are a close relation between economics and jurisprudence as brought out particularly by Wagner, L. von Stein, and H. Rösler, and the concep-

tion of the State as the organ of the nation for any end that may seem desirable.

This latter position accounts for the friendliness between the historical school and the so-called academic socialists or the socialists of the chair (*q.v.*). This friendliness, however, must not be pressed too far, and it must be remembered that not even do the socialists of the chair support the whole socialist program, and still less the whole socialist philosophy. They simply hold that the function of the State may well be and should be enlarged to control and care for the interests of the working class and the less fortunate members of the State, on points where they seem not able to protect their own interests. The historical school does not even dogmatically stand for all this. It represents simply a tendency in this direction. Its real position that one should not dogmatize, but simply by a study of the past and the present see what experience teaches that the State may wisely and safely do. The historical school stands, then, not so much for socialism as for a protest against the dogmatism alike of individualism and of socialism. Its characteristic development has been in Germany, but it has influenced all modern economic thought, and, outside of Germany, particularly England, and to a less extent the United States. In England, those economists who have perhaps most felt its influence are Cliffe-Leslie, Jevons, Ingram, Rogers, Toynbee, Foxwell, Cunningham, Symes, and to a less extent Marshall and Sidgwick. In the United States, Professors Ely, James, H. C. Adams, Jenks, Andrews, Ashley, and Bemis are prominently of this school, tho differing very materially in their conclusions. In Belgium, De Laveleye is the great name of this school; in Austria, Schäffle; in France, Sismondi, and more recently Gide; in Italy, Loria.

In all countries, however, the school is rather a tendency than a distinct school, and has influenced all thought rather than created partisans. Recently a so-called Austrian school of thought has arisen, to some extent critical of the historical school, and has deeply influenced economic development, particularly in Austria, Italy, and the United States. (See *POLITICAL ECONOMY*.) The result has been that as the historical school freed economic thought from the dogmatism of the *laissez-faire* school, so the Austrian school has shown the limitations of the historical study, and that facts must be viewed in the light of psychologic ideas as truly as ideas must be tested by the scrutiny of hard facts. Social mind and individual will enter into and influence every economic act.

HOBBS, THOMAS, was born at Malmesbury, April 5, 1588. He was the son of a clergyman, and went to Oxford at the age of 15. Six years after, having taken his degree, he became tutor to the eldest son of Lord Hardwick, afterward Earl of Devonshire. In 1610 he went abroad with his pupil, making the tour of France and Italy; and after his return became acquainted with Bacon, Raleigh, Ben Jonson, and other distinguished men. But it was not till he had reached the age of 40 that he published, in 1628, his first work, a translation of *Thucydides*.

He was deeply afflicted by the death of the Earl of Devonshire in 1626, and by that of his pupil in 1628. He afterward went abroad with the son of Sir Gervase Clifton, remaining for some time in France; but in 1631 resumed his connection with the Devonshire family by becoming tutor to the young earl, the son of his former pupil, a boy of 13.

In 1634 he went to Paris, and returned to England in 1637, having applied himself during that time to the composition of his first original work, entitled *Elementa Philosophica de Cive* (1642). He soon after published two small treatises, entitled *Human Nature* and *De Corpore Politico*. In 1651 he published the *Leviathan*, the fullest and perhaps the best-known exposition of his views on mind, politics, morals, and religion.

After the meeting of the Long Parliament in 1640, dreading the civil troubles, he returned to Paris. In 1647 he was appointed mathematical tutor to the Prince of Wales, afterward Charles II., by whom he was highly esteemed; but his writings were so obnoxious to the royalist clergy and to all other sects that Charles was induced to part with him, and he fled in alarm to England. There he found himself safe, the Protestant Government according to him the most ample toleration. After the Restoration, however, altho Charles granted him a pension of £100 a year, his views were condemned by Parliament in 1666, and he was in danger of still severer measures. His last works were a translation of Homer and a history of the civil wars. He died December 4, 1679, in his ninety-second year. (For a review of his theories and views, see *POLITICAL SCIENCE*.)

HOLLAND AND SOCIAL REFORM.

I. STATISTICS.

The constitution of the Netherlands after its reconstruction as a kingdom dates from 1815, revised in 1848 and 1887. It established a constitutional and hereditary monarchy. The executive power is given to the sovereign; the legislative power rests with him and the States-General, consisting of two chambers. The Upper Chamber has 50 members, elected by the provincial States from the privileged classes; the Second Chamber has 100 deputies, elected by all male citizens who have paid 10 guilders in ground tax or a certain corresponding amount as direct tax. The total number of electors is about 295,000, or 1 in 15 persons. There is a ministerial council of eight department heads and a deliberative State council of 14 members appointed by the sovereign, and over which the sovereign presides. The kingdom is divided into 11 provinces and 1123 communes, with considerable local autonomy. The total population in 1889 was 4,511,415 on an area of 12,648 English square miles, or 374 to the square mile. The surplus of births over deaths is large. The population is largely Protestant. In 1889, 2,194,649 belonged to the Dutch Reformed Church and 1,596,482 to the Roman Catholic Church. Education is general, but not compulsory nor

necessarily free. There are four universities, very numerous special schools, middle-class schools, and elementary schools. (See EDUCATION.)

The revenue in 1894 was 132,940,890 guilders, and the expenditure, 131,491,882 guilders. The principal sources of revenue are excise duties, direct taxes (land and personal), indirect taxes, and to a small extent imports—Holland having only a fiscal and not a protectionist tariff. **Finances.** The national debt is 1,110,747,643 guilders. The imports in 1894 were 1,461,000,000 guilders, and the exports, 1,115,000,000 guilders. Agriculture flourishes in Friesland, where the finest cattle are raised. The most important manufactures are cheese, gin, cocoa, chocolate, potteries, linens. The fisheries have declined, but still bring in large revenues. Commerce is large. In 1892, 1365 sailing vessels, of which 491 were Dutch, and 7364 steamers, of which 2045 were Dutch, entered the Dutch ports.

II. SOCIAL REFORM.

In Holland wealth is very unequally divided. Wages are very low, and taxation, being indirect, falls mainly on the producer; but the people are very frugal and industrious, and on small means maintain an unusual appearance of comfort and decency. The labor movement has a firm hold in Holland. Trade-unions are numerous, but not like the English unions, many of them being survivals of ancient guilds.

Socialism entered Holland in 1869 with the International (*q.v.*), but did not endure. In 1878 Domela Nieuwenhuis, a retired Protestant minister, a man of great capacity and zeal, reopened the socialist movement, starting the *Recht Voor Allen*, and founding the Social Democratic Union. In 1887 he was imprisoned for political reasons, but in 1888 elected to the Legislature.

In 1889 a Social Democratic League was founded. Cooperation was attempted in connection with the socialist movement, as in Belgium, but did not largely succeed, tho some co-operative stores at the Hague are still carried on. Latterly Mr. Nieuwenhuis (*q.v.*) has turned away from political socialism and developed anarchist communist views. Most of the Dutch socialists, however, follow the program of German socialism and have several journals.

Wages of skilled artisans and factory hands vary from 18 cents to 22 cents. Agricultural wages are greatly depressed. (For an account of the Dutch labor colonies, see LABOR COLONIES.)

Reference: The Report on Holland of the (English) Royal Commission on Labor.

HOLLAND, HENRY SCOTT, was born in Ledbury, Herefordshire, England, in 1847, and was educated at Eton and at Balliol College, Oxford. After some years of residence at Oxford as student of Christ Church he became canon of Truro (1882), and of St. Paul's, London (1884). He is one of the leaders in the Anglican Church. Besides his notable share in *Lux Mundi*, he has written many books, such as *In Behalf of Belief* and *The City of God*. He was principal founder of the Christian Social

Union (*q.v.*) in 1889, and is chairman of the energetic London branch of the Union, for which he edited *A Lent in London* (1895), a course of sermons on social subjects. He is in politics and reform an outspoken leader in Anglican Christian Socialism.

HOLYOKE, GEORGE JACOB, was born in Birmingham, England, in 1817. The son of an iron-worker, he was educated in the mechanics' institute and taught mathematics. In 1837 he heard Robert Owen, and became one of his "social missionaries" stationed at Sheffield. In 1841, in lecturing at Cheltenham, he gave a novel turn to a Bible passage, and was imprisoned six months for blasphemy. He is sometimes called the father of secularism, being neither theistic nor atheistic. For several years he edited *The New Moral World*, and then for 15 years *The Reasoner*. To abolish "the taxes on knowledge" he printed an unstamped newspaper till his fines amounted to £600,000. Becoming interested in cooperation, he identified himself with the cause, and published *The History of Cooperation in Rochdale*, which is said to have led to the formation of 250 co-operative societies. His *History of Cooperation in England* (2 vols.) appeared in 1875-78; *The Rochdale Pioneers* in 1882. Besides these he has written numerous tracts and papers and innumerable newspaper articles on cooperation and on secularism. His life is told in *Sixty Years of an Agitator's Life* (1892).

HOMESTEAD AND EXEMPTION LAWS.—The homestead may be defined as the house and the land connected therewith, which forms the immediate residence of a family. The provisions of law by which homesteads are secured beyond reach of creditors or liabilities on the part of their owners are of modern growth. The Homestead Law of the United States, tho long agitated and several times passed by the House of Representatives, and tho antedated by the like laws of several States, was not enacted by Congress till May 20, 1862. Altho often abused (see PUBLIC DOMAIN), it has proved one of the most beneficent as well as successful laws ever passed. It has opened up to immediate settlements millions of acres of public lands, and has attracted to this country millions of our best citizens. By its provisions any citizen or applicant for citizenship over 21 years of age may enter upon 160 acres of any unappropriated public lands, graded at \$1.25 per acre, or 80 acres of such lands, valued at \$2.50 per acre, by the Government on payment of the nominal fee of \$5 to \$10. After five years' actual residence on the land, a patent thereof is issued to the settler by the general land officer at Washington. This patent is a valid title from the United States. If the purchaser wishes to complete his title in less than five years, he can only do so by purchase. No individual is permitted to acquire more than 160 acres, tho there is no limit to the amount he can purchase. There is a proviso that no lands acquired under the homestead act can be liable for any debts of the settler contracted before the issuing of the patent for his homestead. The exemption laws of various States vary all the

way from values of \$500 in Maine, to \$5000 in California.

HOMESTEAD, STRIKE AT.—In July, 1892, a serious difficulty arose in the iron and steel works of Messrs. Carnegie & Co., Homestead, Pa., employing several thousand men. Wages had been for many years fixed in these works by a sliding scale based upon the selling price of steel billets. (See AMALGAMATED ASSOCIATION OF IRON AND STEEL WORKERS.) The wages were high for many of the men, but a considerable degree of skill is required for the work, which also, in some cases, makes great demands upon the health and strength of the workers, owing to the high temperature of the workshops in which the molten iron has to be worked. The scale agreed upon in 1889 was to expire on June 30, 1892; and when that date approached, the owners gave notice of a desire to reduce the basis from \$26.50 a ton to \$23, and to make the scale terminable at the beginning of January instead of at the beginning of July. To this the employees objected, because in the middle of winter they could not afford a cessation of work, and would not be in a position to resist any unwelcome demands made by the employers. The number of men actually affected by the cut-down was not large, but the delegates of the Amalgamated Association of Iron and Steel Workers, in the name of the employees, rejected the proposed scale. The employers retaliated by formally discharging all who refused their terms and announcing that they would hold no further negotiation with the association as such. A virtual lockout followed, for tho the company had nominally severed all connection with the discharged employees, they subsequently issued a notice that "all the old hands who did not return by a certain date would lose their positions." Further Messrs. Carnegie & Co. had provided against the contingency of a strike or lock-out during the previous six weeks by building a fence round the works three miles long and 12 ft. high upon a parapet 3 ft. in height, and covered with barbed wire, so that the operatives called the works Fort Frick. Having prepared the works to stand a siege, they proceeded to obtain a force of Pinkerton special constables to enable them to introduce non-union labor to take the place of the strikers. Negotiations for the supply of this force had been begun even before the lock-out was declared, tho the men were not introduced until after application had been made to the sheriff for a guard to protect the property of the company. The officials of the Amalgamated Association, on their side, offered to provide such a guard; but their offer was refused by the sheriff on the ground that tho they might prevent destruction of property, they would not facilitate the introduction of non-union labor. Three hundred Pinkerton constables were brought by water to the works. They were introduced into the State unarmed, but brought arms and ammunition with them packed in boxes. On their way up the river these boxes were unpacked, so that when the force arrived at Homestead in the early morning they were fully armed. News of their coming had preceded them, and a large crowd of

strikers were in waiting to prevent their landing, having gone in behind the wall of steel rails. The testimony is conflicting as to which party fired first, but a skirmish ensued with a heavy volley of shots from the strikers, in which seven of the Pinkertons and strikers were killed and many others wounded. The struggle continued two days. On the opposite bank a brass ten-pound cannon was obtained and fired on the barges. The crowd also attempted to set fire to the barges by pouring burning oil upon the river, and finally the Pinkertons surrendered to the leaders of the Amalgamated Association, and were imprisoned in a rink until evening, when they were got away from the town by rail. On their way to the rink and to the station they were beaten and maltreated in spite of the efforts of the strike leaders to control the crowd, which was largely composed of Slavs, Hungarians, and women. Troops were sent to Homestead by the Governor of Pennsylvania and stationed there many weeks, the town being put under martial law. Great severity was displayed. Eleven workmen and spectators were killed in the fights. Some of the leaders were arrested and order was restored; for tho the manager, Mr. Frick, was afterward shot at by a Russian named Berkmann, this act seems to have been quite independent of the men on strike. For an unguarded expression of sympathy with Berkmann, a private (James) was strung up by his thumbs and flogged. After about six weeks a large number of the strikers returned to work, but a number of new men were subsequently engaged by the company, and many of the strikers did not return. A committee of Congress, appointed to investigate the employment of Pinkerton detectives, held an inquiry at Pittsburg into the circumstances of the strike. The evidence given before them showed that a conviction prevailed among the men, that since the introduction of the McKinley tariff the profits of the company had increased, and that there was, therefore, no occasion for any such reduction of wages as they proposed. Further, the strength of the feeling against the employment of Pinkerton special constables found general expression. Great excitement over the strike was roused through all the country. Subscriptions were raised by working men to support the strike. Lawyers were sent on to defend the strikers against persecution for using arms to defend their homes against "foreign invasion." The feeling against the Pinkertons ran very high. In Massachusetts an act prohibiting the employment of Pinkerton constables was passed in 1892, and a similar act was passed in New Jersey during the same year.

HOMICIDE.—The following summary is presented by Mr. Frederick H. Wines, special agent on pauperism and crime for the Eleventh Census in his *Bulletin* report:

"Of 82,329 prisoners in the United States June 1, 1890, the number charged with homicide was 7386, or 897 per cent.

"Omitting 35 who were charged with double crimes, 6958 of them (or 94.65 per cent.) were men, and 393 (or 5.35 per cent.) were women.

"As to color, 4425 were white, 2739 negroes, 94 Chinese, 1 Japanese, and 92 Indians.

"As to the nativity of the 4425 whites, 3157 were born in the United States, 1233 were foreign born, and the birthplace of 55 is unknown.

"A careful and accurate inquiry into the parentage of those born in the United States results in the mathematical conclusion that 56.14 per cent. of homicide committed by white men and women is chargeable to the native white element of the population, and 43.86 per cent. to the foreign element. On the same scale of 4614 to 3605, the negro contribution to homicide is represented by 5478.

"More than one half of the foreign-born whites are unaturalized, and nearly one fifth are unable to speak the English language.

"In respect to age, prisoners charged with homicide range from 11 to 86 years. One sixth of them are under 24 years, and more than one half under 33 years of age. Their average age is 34 years and 193 days. The lowest averages are among the Indians, 30 years and 180 days, and the negroes, 30 years and 279 days. The highest are among the Chinese, 37 years and 246 days, and the foreign-born whites, 4 years and 159 days. The average age of women charged with homicide is 32 years and 216 days. The ages at which homicide was committed are estimated to be at least 5 years below the averages here stated.

"Nearly one half of this group of prisoners were found to be unmarried. The number of unmarried was 3615; married, 2715; widowed, 703; divorced, 144.

"The percentage of those who can both read and write is 61.73; of those who can read only, 4.84; of those who can do neither, 33.43. Of the negroes, more than one half can neither read nor write; of the Indians, nearly two thirds. The percentage of illiteracy among the foreign born is nearly or quite three times as great as that among the native whites.

"The number who have received a higher education is 253, or 3.44 per cent.

"More than four fifths have no trade. The foreign born and their children have much more generally acquired a trade than the native whites, and the native whites than the negroes.

"The occupations of 6546 prior to incarceration have been ascertained, and are grouped as follows: professional, 102; official, 38; agricultural, 1893; lumber, 29; mining, 212; fisheries, 19; trade and commerce, 173; transportation, 380; manufactures and mechanical industries, 1086; personal service, 600; unskilled labor, 2253; miscellaneous, 21.

"The number employed at the time of their arrest was 5650; unemployed, 1225; unknown, 467.

"The habits of 973, in respect of use of intoxicating liquors, are not stated. The remaining 6378 are classed as follows: total abstainers, 1282; occasional or moderate drinkers, 3829; drunkards, 1267.

"The number arrested and imprisoned in the State of their residence was 6268; out of the State, 867.

"463 had served as soldiers in the civil war.

"534 were known to have served a previous term of imprisonment.

"224 were federal prisoners.

"As to their physical condition, 6140 were in good health, 600 ill, 283 insane, 24 blind, 14 deaf and dumb, 18 idiots, and 263 crippled.

"Of prisoners charged with homicide, more than one eighth are awaiting trial.

"Of those convicted, 158 are awaiting execution, 2405 sentenced to imprisonment for life, 845 for 20 years and over, 1438 for from 10 to 10 years, and 1395 for less than 10 years. The tendency to greater severity increases slightly from east to west, and from north to south. The average sentence less than life is 13 years and 292 days. It is greater for men than for women, and for negroes than for whites. The highest average sentence is pronounced upon Chinamen.

"The number of cases classed as murder is 5548, of which nearly one half received a life sentence. The number classed as manslaughter is 1704, of which nearly one half received a sentence of over 10 years.

"Of the 153 prisoners awaiting execution, 49 were found in the Kansas penitentiary, no date having been fixed for their execution by any governor since 1872. The death penalty is thus practically abolished in Kansas, tho not by statute. The only States in which it has been abolished by law are Rhode Island, Michigan, and Wisconsin. The figures here published do not indicate any increase in the number of homicides as the result of such abolition.

"In the Tenth Census there were reported 4668 prisoners charged with homicide. In the Eleventh Census the number is 7351. This is an increase of 59.53 per cent., while the increase in the total population has been only 24.86 per cent. But it is largely explained by the great length of sentences for homicide, in con-

sequence of which the majority of those reported in 1880 are again reported in 1890, together with those since convicted of the same offense.

"The county sheriffs have reported 156 executions during the calendar year 1889, of which 94 were in the South Atlantic and South Central divisions. They have also reported 117 lynchings, of which 94 (the same number) were in the same divisions. These reports are not believed to be complete, but are given for what they are worth."

Mr. Wines has also presented in a succinct but clear way the leading features of the law of homicide in the United States, showing its legal varieties and its varying definitions in the several States and Territories, together with the varying sentences authorized by law. He observes that the variations of the codes, in the adjustment of penalty to the guilt of homicide, are on their face absurd and indefensible, and that the claim that there is a natural standard of justice in the human mind, which will enable legislators to arrive at an approximately accurate judgment of the desert of crime, is contradicted by the record which legislative bodies have made for themselves. He suggests possible remedies for what he terms "the confused state of the criminal law."

Says Mr. Wines:

"Two impressions have been received in the course of this investigation, by the mathematical demonstration which it furnishes of the erroneous nature of certain prevalent beliefs.

"First. As to the effect of severity of punishment upon the volume of crime.

"It is popularly supposed that the prevalence of crime is chiefly due to inadequate punishment, and that the remedy for it is to be found in harsher laws and a more rigorous administration of them by the courts.

"If this were so, then there should be less homicide, relatively to the population, in the South Central division than in any other. The percentage of sentences for 20 years and over is there greater than in any other division, and the average sentence pronounced by the courts is longer. In these respects, the Western division stands almost side by side with the South Central. Yet the ratio of prisoners charged with homicide to the total population of these divisions is much higher than elsewhere; it is more than double the ratio for the other three divisions taken together.

"The lowest average sentence is in the North Atlantic division, where there are also the fewest death sentences, except in the South Central, and yet the ratio of prisoners charged with homicide in the North Atlantic division is less than in any other.

"The ratio of prisoners charged with homicide in Rhode Island, where the death penalty has been abolished, is lower than in any other State in the North Atlantic division, except in Massachusetts.

"The number of executions in 1880, as reported by the sheriffs, was relatively largest in the Western division, where it was 7.1 in 178,095 of the population. Yet it was in this very division that the ratio of prisoners charged with homicide was also greatest.

"The next largest ratios of executions to the population were in the South Atlantic (in 205,998) and South Central (in 215,155) divisions. Yet these are the divisions in which are also found the next largest ratios of prisoners charged with homicide.

"It is frequently said that lynching takes place where the law is not executed, and that it is designed as a protest against the inefficiency of the courts. But the sections in which there are the most executions are those in which there are also the most lynchings. The number of executions and of lynchings reported by the sheriffs in the Southern States is identically the same. It is further to be noted that the largest number both of executions and of lynchings is in the South Central division, where the average sentence for homicide is the longest, and where the percentage of long sentences imposed by the courts is the highest.

"Second. As to the causes of crime.

"A careful study of the figures here given will serve to correct the exaggerated impressions current as to the causation of crime.

"Ignorance is a cause of crime. Nevertheless, 66.57 per cent. of all prisoners charged with homicide have received the rudiments of an education, in English or in their own tongue, and 3.44 per cent. have received a higher education.

"Ignorance of a trade is a cause of crime. But 19.35 per cent. are returned as mechanics or apprentices, and a much larger number have the necessary skill to follow mechanical pursuits.

"Idleness is a cause of crime. But 82.21 per cent. were employed at the time of their arrest.

"Intemperance is a cause of crime, tho a less active and immediate cause than is popularly supposed. But 20.10 per cent. were total abstainers, and only 19.87 per cent. are returned as drunkards.

"All of these causes, and others which might be named, are in fact only contributory causes, whose operation is secondary and indirect. External circumstances facilitate or hinder the commission of crime. They operate as a stimulant to the criminal impulse or as a check upon it. But the root of crime is not in circumstance, but in character. The saying of the Great Teacher will forever remain true; 'Out of the heart proceed evil thoughts, murders,' Science confirms the moral teaching of religion."

The homicides in the United States, according to the record kept by the Chicago *Tribune*, were as follows from 1886-95 :

YEARS.	Murders and Homicides.	Legal Executions.	Lynchings.
1886.....	1,449	83	133
1887.....	2,335	79	123
1888.....	2,184	87	144
1889.....	3,597	98	175
1890.....	4,290	102	127
1891.....	5,906	123	192
1892.....	6,791	107	236
1893.....	6,615	126	200
1894*.....	7,747	112	165
1895†.....	7,900	113	160

The figures in the first column represent manslaughter of all kinds when perpetrated by an individual, whether by premeditation or passion, or by an insane person, or in self-defense, rioting, duels, and resisting arrest by officers of the law. The number of homicides in the partially reported year 1894 is swollen by the deaths of rioters and others in the strike disturbances of July. The percentage of executions to killings in the nine years included in the table is 2.20. The percentage of killings to total deaths from all causes, same period (estimated), is 0.52, or about 52 per 10,000.

Italy takes the lead of European nations, with an average annual crop of murders of 2470, a ratio per 10,000 deaths of 29.4 ; Spain follows, with a ratio of 23.8, and 1200 murders ; Austria, ratio of 8.8, and 600 murders ; France, ratio of 8.0, and 662 murders ; England, ratio of 7.1, and 377 murders. The figures, however, represent actual murders, not homicides from all causes, as do those in the United States table.

In England, in the reign of Henry VIII., there were 71,400 persons hanged or beheaded ; in one year 300 beggars were executed for soliciting alms. In 1820 no less than 46 persons were hanged in England for forging Bank of England notes, some of which were afterward asserted to be good. Capital punishment was

abolished in Italy in 1875, and murders increased 42 per cent.

HOPEDALE was an attempt at religious communism about the same time as the more famous attempt at Brook Farm. As the latter was the outcome of Unitarianism, so Hopedale was the outcome of Universalism. Its founder was Rev. Acton Ballou (*q.v.*). Milford was the site of the community. Its first compact dates from January, 1841, before Brook Farm ; but the community did not actually commence operations till April, 1842. Hopedale lasted much longer than Brook Farm, continuing till 1856 or 1857. In 1854 it was at its highest point of success and hopefulness. The community was originally called Fraternal Community No. 1, and numbered about 30 individuals.

By 1851 the community came to own about 500 acres, consisting of about 30 new dwelling-houses, three mechanic shops, with water power, carpentering and other machinery, and a small chapel used for educational and religious purposes. At the same date it had about 36 families, besides single persons—some 175 persons in all. According to a tract written by Mr. Ballou himself in 1851, the leading characteristics of Hopedale were as follows :

"1. It is a church of Christ (so far as any human organization of professed Christians, within a particular locality, have the right to claim that title) based on a simple declaration of faith in the religion of Jesus Christ, as He taught and exemplified it, according to the Scriptures of the New Testament, and of acknowledged subjection to all the moral obligations of that religion. No person can be a member who does not cordially assent to this comprehensive declaration. Having given sufficient evidence of truthfulness in making such a profession, each individual is left to judge for him or herself, with entire freedom, what abstract doctrines are taught, and also what external religious rites are enjoined in the religion of Christ. No precise theological dogmas, ordinances, or ceremonies are prescribed or prohibited. In such matters all the members are free, with mutual love and toleration, to follow their own highest convictions of truth and religious duty, answerable only to the great Head of the true Church Universal. But in practical Christianity this church is precise and strict. There its essentials are specific. It insists on supreme love to God and man—that love which 'worketh no ill' to friend or foe. It enjoins total abstinence from all God-contemning words and deeds ; all unchastity ; all intoxicating beverages ; all oath-taking ; all slaveholding and pro-slavery compromises ; all war and preparations for war ; all capital and other vindictive punishments ; all insurrectionary, seditious, mobocratic, and personal violence against any government, society, family, or individual ; all voluntary participation in any anti-Christian government, under promise of unqualified support—whether by doing military service, commencing actions at law, holding office, voting, petitioning for penal laws, aiding a legal posse by injurious force, or asking public interference for protection which can be given only by such force ; all resistance of evil with evil ; in fine, from all things known to be

* To October 17, 1894.

† To November 18, 1895.

sinful against God or human nature. This is its acknowledged obligatory righteousness. It

does not expect immediate and exact perfection of its members, but holds up this practical Christian standard, that all may do their utmost to reach it, and at least be made sensible of their shortcomings. Such are the peculiarities of the Hopedale Community as a church.

"2. It is a civil State, a miniature Christian republic, existing within, peaceably subject to and tolerated by the governments of Massachusetts and the United States, but otherwise a commonwealth complete within itself. Those governments tax and control its property according to their own laws, returning less to it than they exact from it. It makes them no criminals to punish, no disorders to repress, no paupers to support, no burdens to bear. It asks of them no corporate powers, no military or penal protection. It has its own constitution, laws, regulations, and municipal police; its own legislative, judiciary, and executive authorities; its own educational system of operations; its own methods of aid and relief; its own moral and religious safeguards; its own fire insurance and savings institutions; its own internal arrangements for the holding of property, the management of industry, and the raising of revenue; in fact, all the elements and organic constituents of a Christian republic on a miniature scale. There is no red republicanism in it, because it eschews blood; yet it is the seedling of the true democratic and social republic, wherein neither caste, color, sex, nor age stands proscribed, but every human being shares justly in 'liberty, equality, and fraternity.' Such is the Hopedale Community as a civil State.

"3. It is a universal religious, moral, philanthropic, and social reform association. It is a missionary society, for the promulgation of New Testament Christianity, the reformation of the nominal church, and the conversion of the world. It is a moral suasion temperance society on the teetotal basis. It is a moral power anti-slavery society, radical and without compromise. It is a peace society on the only impregnable foundation of Christian non-resistance. It is a sound theoretical and practical woman's rights association. It is a charitable society for the relief of suffering humanity, to the extent of its humble ability. It is an educational society, preparing to act an important part in the training of the young. It is a socialistic community, successfully actualizing, as well as promulgating, practical Christian socialism—the only kind of socialism likely to establish a true social state on earth. The members of this community are not under the necessity of importing from abroad any of these valuable reforms, or of keeping up a distinct organization for each of them, or of transporting themselves to other places in search of sympathizers. Their own Newcastle can furnish coal for home consumption, and some to supply the wants of its neighbors. Such is the Hopedale Community as a universal reform association on Christian principles."

These high hopes were for a time realized. Acton Ballou worked faithfully to carry them

into effect. That they finally failed was no fault of Mr. Ballou. At first Mr. Ballou was the head of the community, but ultimately he was superseded by a Mr. G. D. Draper, a sharp, enterprising business man. He soon became the business spirit of the whole community. He had a brother in business with him who had no sympathy with the community. Mr. Draper became more and more interested in lucrative outside concerns. Meanwhile, he had bought up three fourths of the joint stock. Finally, becoming dissatisfied with the community, he paid the debts and compelled its suspension.

HOUSEHOLD ECONOMIC ASSOCIATION, THE NATIONAL.—This association was incorporated March 16, 1893, under the name of the National Columbian Household Economic Association, but at its meeting in April, 1894, the word Columbian was dropped from its name. The object of the association, as declared in its constitution, is:

"1. To awaken the public mind to the importance of establishing bureaus of information where there can be an exchange of wants and needs between employer and employed, in every department of home and social life. 2. To promote among members of the association a more scientific knowledge of the economic value of various foods and fuels; a more intelligent understanding of correct plumbing and drainage in our homes, as well as need for pure water and good light in a sanitarily built house. 3. To secure skilled labor in every department in our homes, and to organize schools of household science and service."

The management is vested in a board of 16 directors, with headquarters in Chicago, but composed of members from all States. The association holds annual meetings, and has the following standing committees:

1. Committee on Sanitary Condition of the Home Correct Plumbing and Ventilation, Light, Heat, etc. The duties of this committee shall be to establish home science clubs and to make a study of sanitary science.

2. Committee on Cooking Schools, Industrial Schools, Housekeepers' Emergency Bureau, Cooperative Laundries, Cooperative Bakeries, Training School for Servants, Kitchen Gardens and Public Kindergartens, Diet Kitchens, Mothers' and Nurse Girls' classes, and Training School for Nurses. The duties of this committee shall be to keep itself informed of the work of each school and institution, and to direct all who wish to know where and at what hour one may visit these schools.

3. Committee on Food Supply. The duties of this committee shall be to prepare a descriptive list of wholesale and retail foods, such as meat, vegetables, butter, eggs, etc.; to compare New York and Chicago with other markets, and furnish statements of what articles of food are most desirable to buy, either in large or small quantities, with household recipes for cooking and all other matters relating to household economics.

4. Committee on Housekeepers' Clubs. The duties of this committee shall be to formulate plans to simplify housework in village communities, to suggest plans for cooperation in laundries, bakeries, and kitchens, to discuss plans for profitable market gardening, poultry and egg-raising on a small scale, and to furnish information on all topics connected with housework.

5. Committee on Sewing. The duties of this committee shall be to keep itself informed of the work done in various schools where sewing is taught, and give outlines of the methods used.

6. Press Committee. It shall be the duty of this committee to secure the publication of notes concerning the National Household Economic Association in some journal or periodical in the North, South, East, West, and Middle sections of the country, in order to keep alive public interest in the science of household

economics; each member of the committee taking charge of the matter in her own section.

All women may become members of this association by the payment of an annual fee of \$.

The association works mainly not by establishing new clubs, but by inducing existing woman's clubs to establish departments of household economics, for the study of how better to manage the home, educate better servants, have more healthy food, etc. The Honorary President of the association is Mrs. Potter Palmer; the Corresponding Secretary, Mrs. Alice J. Whitney, 453 Belden Avenue, Chicago, Ill. Mrs. Helen Campbell (*q. v.*) has been appointed National lecturer for the association, and since the syllabus of her lectures have been adopted as a part of the program of the association, we print this in full, as giving something of the scope of this important subject:

I.—THE STATICS AND DYNAMICS OF HOUSEHOLD ECONOMY.

The relation of household economics to life. Structural and functional organization of the household; the essentials of each and their interdependence. Arts, crafts, and sciences involved. The low popular opinion of household economics, its cause and effect. Personality and generalization. Savage and child to scientist. Evolution of household economics. Division of labor on sex lines and the biological reason for this division. Ascent of man economically.

Gibson; Homes in City and Country, by Russell Sturgis, *et al.*

II.—THE HOUSE.

What is a house? Relation of house to human life. Value of human production in proportion to durability and usability. Organic structure of the house with its evolution. The kitchen and derivatives. Bedroom and derivatives. Parlor and derivatives. Relation of differentiation and specialization in building to the same processes in social evolution: hut to hotel; tent to tenement. The typical farmhouse. Industries represented. The rudimentary shop. Effect of habitat. Soil, location, foundation, elevation. Topographical maps. From isolation to aggregation. The City Beautiful.

P. Hayward, Popular Science Monthly, vol. iv, p. 69.

III.—THE BUILDING OF THE HOUSE.

The place of architecture in household economics. Relation to other arts. Primitive architecture and its development—domestic, civic, and ecclesiastic. The city and the king. Ancient architecture, public and private. Herculaneum and Pompeii. Character of Oriental home. Effect of house on its occupants. The house and the family. Confusion of domestic with industrial architecture. Rooms and their relation. Existing conditions of domestic architecture in Europe and America. Built to live in and built to sell. Limitation of the private home. Gridiron topography. Need of combination and juxtaposition. Essentiality of the separate home. Our present trend.

IV.—ORGANISM OF THE HOUSE.

Structural necessities. Vital processes of the house. Air, light, heat, water, ventilation. Troglodytes, ancient and modern. Proportion of air to occupancy. Air and women. Air and boys. "Night Air." Ventilation, public and private. Our schools. Light: its influence on the body and spirit. Sun-baths. The artificial light habit. Heat, natural and artificial. Methods of application. Plumbing. Water, clean and unclean. Drainage, private and public; its evolution history, present methods and tendencies.

Jacob (Manual of Health Series).

V.—DECORATION.

Use and value of decoration in nature and art: its laws and principles. Relation to pictorial art. Evolution and history. Special development in races. Associate conditions in cause and effect. Racial influences. Periods. Our present level—the highest, the lowest, the average. Masculine and feminine decoration. "How to make home beautiful." The sense of beauty in women. "Traces of a woman's hand." Survivals of savagery. "Home-made," "ready-made," "born and not made." The power of the homemaker. Educational and moral value of truth in art. Artistic sins and their moral counterparts. Homes, schools, and prisons. Practical possibilities. "Often in a wooden house a golden room you find." National importance of elevation in art.

VI.—FURNISHING.

Organic relation of furniture to humanity. Man manufactures extensions of his body while the animals grow them. Laws of construction. Use and beauty. Practical conditions. Destructibility. Relative value of materials, mineral, vegetable, and animal. Limitations of applied beauty. Essential principles, use, ease, and economy. Evolution of house furniture; the seat, the couch, the table, the cupboard, the vessel. Vessel, utensil, tool. History, distribution, present status. Relation to class; industry, wealth, sex, age. Children's furniture. Carpets, rugs, and cushions. Upholstery. Specialization and personality in furniture. Mobility as a factor in evolution. Ideals.

Hoffmann; Furniture, by F. S. Meyer; Practical Decorative Upholstery, by P. A. Moreland.

VII.—HOUSEHOLD INDUSTRIES.

Structure and function. Functional development of society and domestic industries. Order of appearance of domestic industries and progress toward higher specialization. Relation of work to worker. Effect of special industries on body and mind. Exercise more important than environment; action than reaction. The division of labor. Sex in industry. Distinction one of degree, not of kind. Jane-of-all-trades. Arrested development and suppressed specialization. Effect of racial growth. Present condition of domestic industries in relation to social economy and personal development. The two remaining functions, nutritive and excretory.

VIII.—NUTRITION.

Nutritive function of the household in relation to the individual; in relation to society. Processes of nutrition in organ; organism and organization. Importance of nutrition to life and of its secondary processes to development. The struggle for existence. Man's victory. No longer a struggle but a growth. Household nutrition merely a stage in the process. The kitchen, the stomach of the house. Primitive nutrition simple and private. Increase of complexity and coordination. From bone to banquet. Physiological needs. Waste and supply. Age and occupation. Racial dietetics. Theories and facts. Some of our errors. Control of nutrition and its consequences.

IX.—FOOD AND ITS PREPARATION.

Chemical properties of foods. Animal and vegetable foods; mineral constituents. Nutritive values. Our food supply "from the ground up." Preparatory processes, general and special. Diets. Vegetarianism. The cooking animal. Cooking as an art, a science, a handicraft, a profession. Apparatus and methods—primitive; ancient; modern; local. Our advance in this art as compared with others. Dietsaries for infancy, childhood, youth, maturity, age, and for the sick. Markets and marketing. Adulteration. Super-visions of foods. Civilized living.

Richards, New England Kitchen Magazine, 1895; How to Feed the Baby, by Dr. Charles Page.

X.—CLEANING AND ITS PROCESSES.

Cleaning the essential and permanent household industry. The excretory system of the household organism. Friction, exposure, and decay. Essential and necessary waste. The grave and the garret. Fuel and flies. The dirt we make. Cleaning, mechanical and chemical. Primitive household without excretory system. Semiannual attacks on dirt. Elements of cleaning processes, sweeping, dusting, and washing. Development and excesses. The New England housewife and her Dutch prototype. Fluff. Dust and its dangers. Bacteria and microbes. Antiseptic cleaning. Light and cleanliness, physical, mental, and moral. What it is to be clean, and the results.

References: Bacteria and their Products, by Germain/Sims Woodhead; Dust and its Dangers, by T. Mitchell Prudden; Chemistry of Cooking and Cleaning, by Mrs. Ellen H. XI.—SERVICE.

The servant question. Total inadequacy of existing treatment. Failure to grasp essential distinction between service and labor. Service a condition peculiar to humanity. Philosophy of service. Division of labor and coordination. Primitive coordination compulsory. The army of Xerxes as illustration of its inferiority. Evolution of service. Effect of service on character. Status of domestic service in social economy. Present condition. Some secondary conditions of domestic service. The stranger within our gates. Reports of Bureaus of Labor. Philadelphia special inquiry in this connection. The training school and its results. Matters of life and death. Diploma and license. Servant, employee, artist, and professor.

Stone; The Biddy Club, by Griffith A. Nicholas; Domestic Service, by E. P. Whipple, The Forum, vol. i., p. M: 25; Prisoners of Poverty, by Helen Campbell, Chapters on Domestic Service.

XII.—ORGANIZED LIVING.

Law of organization in individual and species. Organic evolution, racial, national, civic, domestic. Primitive conditions of household economy. The woman's world and the man's. How to "keep the boys at home." Survivals and rudiments. Effects on the brain. Strain of contending eras. Relation to progress. Home influence. The matrix of civilization. How we really live. Flat, club, hotel, and boarding-house. Reaction and compromise. Lines of development. Scientific prophecy. Asa Gray and his unknown butterfly. Our possibilities. The higher education and the higher life.

Pierce; England's Ideal and other Papers on Social subjects, by Edward Carpenter; Essay on "Simplification of Living;" Civilization, its Cause and Cure, by Edward Carpenter (chapter on "Custom").

HOWARD, JOHN, was born at Enfield, England, in 1726. His father, a wealthy London merchant, apprenticed him to a grocer, but in 1742 he bought up his indenture. Until 1773 he lived a comparatively secluded life, distinguishing himself only in charity. He was made the high sheriff of Bedford in 1773, and the characteristic work of his life then began. Visiting the jails, he found them wretchedly defective; but what chiefly shocked him was that neither the jailer nor his subordinates were salaried officers, but were dependent for their livelihood on fees which they rigorously exacted from the prisoners themselves. Some whom the juries had declared not guilty, others in whom the grand jury had not found even such appearance of guilt as would warrant a trial,

others whose prosecutors had failed to appear, were frequently detained in prison for months after they had ceased to be in the position of accused parties, until they should have paid the fees of jail delivery. His prompt application to the justices of the county for a salary to the jailer in lieu of his fees was met by a demand for a precedent for charging the county with such an expense; and he went accordingly from county to county until his journey had extended to every town in England which contained a prison, but the object of his search eluded inquiry. But he did find so many abuses in prison management that he determined to devote himself to the reform of those abuses. The task cost him a fortune and the best remaining years of his life.

He reported his discoveries to the House of Commons, and at once an act was passed which provided for the liberation, free of all charges, of every prisoner against whom the grand jury failed to find a true bill, giving the jailer a sum from the county rate in lieu of the abolished fees. This was followed in June by another requiring justices of the peace to see that the walls and ceilings of all prisons within their jurisdiction were scraped and whitewashed once a year at least; that the rooms were regularly cleaned and ventilated; that infirmaries were provided for the sick, and proper care taken to get them medical advice; that the naked should be clothed; that underground dungeons should be used as little as could be; and generally that such courses should be taken as would tend to restore and preserve the health of the prisoners.

He then devoted himself for eight or nine years to an investigation of the prisons of Europe, overcoming many difficulties and braving many dangers. The publication of his large accumulation of facts had a direct and immediate influence upon prison legislation. The last five years of his life were chiefly devoted to researches as to the means which ought to be used in the prevention of the plague and all contagious diseases. In pursuit of knowledge on this subject he again traveled through Europe and Asia Minor, visiting hospitals, lazarettos and pest-houses of all kinds, and published the results of his researches in 1789. Attempting to make yet another European tour, he took a fever from a patient he was attending and died at Cherson in 1790. He was of a deeply religious temperament, and the greater part of his life shows that his enthusiasm of humanity was the unusual yet normal outcome of the sincerest piety. "He died a martyr after living an apostle." (See PENALOGY.)

HOWELLS, WILLIAM DEAN, was born at Martinsville, O., in 1837. His father was a printer, and of him he learned the printer's trade. He afterward became editor of the Cincinnati *Gazette* and the *Ohio State Journal*. He was United States Consul at Venice 1861-65, and in 1871 became editor of the *Atlantic Monthly*, retaining this position till 1880. Since then he has produced a long list of writings, all of his works circulating largely in England, making his name almost as familiar there as in the United States. He conducted for several years "The Editor's Study" in *Harper's*

Magazine. He has interested himself in recent years very largely in social reform in various novels, and especially in his *A Traveller from Altruria*.

HUBER, VICTOR AIMÉ, who may be called the founder of German Christian socialism, was born in Stuttgart in 1800. He took a degree in medicine in 1820 at the University of Göttingen, but obtained, through the influence of his mother, a State stipendium. Throwing himself into the social and political movement of the times, he visited Paris, Lisbon, Hamburg, Edinburgh, Italy, and at last settled down in Bremen as one of the masters at the Merchants' School of that town. He became more than ever interested in social problems, but now from a religious standpoint.

In 1832 he procured a post at the University of Rostock, and a call to Marburg six years later. In 1839 he was elected as the representative of this collegiate body in the Hessian House of Representatives as an ultra-Conservative statesman. Friedrich Wilhelm IV., of Prussia, now induced him to come to Berlin and to found a Conservative periodical under royal patronage. As editor of this periodical, the *Janus*, Huber made it the vehicle for pressing his pet scheme of cooperation.

After the March revolution in 1848 this publication, which in many respects resembled the *Christian Socialist of England* and *L'Avenir* of France, was discontinued, and another method for rallying the friends of social reform on Conservative principles was made by Huber in forming his Association of Christian Order and Liberty. But this, too, proved unsuccessful. Huber found more favor, in truth, among the Social Radicals than in his own reactionary circles. His assistance was sought by some Liberals and Democrats who had lately established a "building society for the common good," which had for its object the improvement of the dwellings of the poor. Huber readily subscribed \$7000 to its funds and drew up its constitution. He also interested himself in the *Gesellenwater Kolping* and Bishop Ketteler (*q.v.*). But failing to interest the aristocratic classes of Berlin, he found a new home in the little town of Wenigerode, among the Hartz Mountains, and left only to pay visits to France, Belgium, and England, and thus became a living organ, so to speak, for international communication on the subject of cooperative association. He lived in daily companionship with laborers and artisans in order to raise them by personal contact to a higher level. In this he spared no sacrifice of time or money. He founded a loan society, an institution for smaller tradespeople, and a technical school for the instruction of young apprentices after leaving the ordinary schools, where he taught himself. He also called into existence a Christian Association of Journeymen. During the summer of 1869 he was prostrated by illness, and died July 19 of that year.

HUET, FRANÇOIS, was born at Villeau, in Beauce, in 1814. M. de Lavelle, his distinguished pupil, says of him (*Socialism of Today*, p. 253):

"At the age of 22 he was appointed Professor of Philosophy at the University of Ghent, a post which he retained up to 1850. He was the disciple of a spiritualist philosopher, a man of very vigorous intellect, Bordas-Demoulin, and, through him, of Descartes and Plato. Protesting to the last against Ultramontanism and its new dogmas, they were the last Gallicans of the school of Pascal and Bossuet. About the year 1846 his philosophical studies led Huet to approach social questions, as has been the case with most of the philosophers of our times. . . . At Ghent, Huet collected around him a group of pupils, among whom was the author of this book, and from before 1848 we thoroughly studied, each with his own preferences, the various systems of social reform. . . . Huet also published, in 1864, *La Science de l'Esprit*. He presided over the education of Prince Milan, now King of Servia, and even followed him to Belgrade. Having returned to Paris to undergo treatment for a severe disease, he died from the effects of a surgical operation (1869). . . .

"For the basis of his system he takes the principles of 1789, and endeavors to realize in everything the motto, 'Liberty, Equality, Fraternity.' His ideas on this point were, without his knowing it, similar to those of Fichte. . . . The following is a summary of them: Men are by right equal. They have the right to an opportunity to develop themselves. This means a right to property, which should be realized in the 'right to patrimony,' by virtue of which every person in a position to labor would obtain a share in the general wealth. 'Every year a division should be made of the patrimonial property left ownerless through deaths. All the young people of either sex, who during this year reach the age of either 14 or 25 years, should obtain a share, the share of each person of full age being double the share of each minor.' The right of hereditary succession is abolished, but gifts by will or *inter vivos* are authorized. Each person, however, can dispose only of property acquired by his own labor, and not of that received by way of gift or legacy. This goes to increase the common patrimony. 'Continuously fed from an inexhaustible source, the general patrimony would be composed, at any given time, of all the ancient patrimonial property and of all the subsequent accumulations of capital; for as these accumulations could only once change hands by way of gift, at the deaths of the donees they would go to swell the mass of the original patrimony. 'Leveling socialist as Huet is when he claims for all an equal right of accession to property, he is a thorough individualist on the question of the organization of labor. He rejects all State intervention; he does not like even corporations holding industrial capital. The individual, put in possession of 'his patrimony,' may work by himself, or in partnership with others, provided he do so freely, without any privileges or close corporations.'

M. Huet also published a charming book entitled *Le Règne Social du Christianisme*, containing a complete social theory based on Christianity, which Lavelle says has not met the attention it deserves only because it is too full of Christianity for the socialists and too full of socialism for Christians.

HUGHES, THOMAS, was born near Newbury, Berkshire, England, in 1823. He was educated at Rugby under Dr. Arnold, and at Oriel College, Oxford, where he was graduated in 1845. He was called to the bar at Lincoln's Inn in 1848. He was prominent in the Christian socialist movement of Maurice and Kingsley in 1849-50. (See CHRISTIAN SOCIALISM.) He published his immortal *Tom Brown's School-days* (1857); *Tom Brown at Oxford* (1861); *The Manliness of Christ* (1879), besides many lesser writings. From 1865-74 he sat in Parliament. In 1869 he became Queen's Counsel, and in 1882 a county court judge. In 1870 he visited the United States. Becoming interested in this country, the "New Rugby" colony was conceived. Fifty thousand acres were bought and 300 men were actually on the grounds, mainly sons of English farmers. Judge Hughes

was its active superintendent. Roads, cricket grounds, a hotel, and brick kiln were started. Cooperation and profit-sharing were attempted, but Judge Hughes was no financier, and it honorably failed. He died March 22, 1896.

HUGO, VICTOR MARIE, Vicomte, was born in 1802 at Besançon, where his father was commandant of the garrison. His youth was spent partly with his mother in Paris, partly in Italy and Spain, where his father held high appointments. He early acquired distinction by his poetry, and before he was 30 years of age his published works were numerous and famous. He led in a literary revolution whose followers—*la jeune France*—called themselves the Romanticists, and their opponents the Classicists. The literary war lasted several years. In 1832 the ministry suspended one of his dramas—*Le Roi s'amuse*—but his popularity continued to increase, and in 1837 Louis Philippe made him an officer of the Legion of Honor, and in 1845 a peer of France. After the Revolution of 1848 he was elected to represent Paris, both in the constituent and in the legislative assembly, in which he manifested democratic principles, and was one of the members of the Extreme Left who were banished from France for life by Louis Napoleon. He went to reside in the island of Jersey. In 1852 he assailed the ruler of France in a political pamphlet, *Napoleon le Petit*; and next year, in *Les Châtiments*, a series of poems written with great *verve*, in the same spirit. He refused to avail himself of the amnesty of 1859; but on the fall of the empire joined in the republican movement, and was returned to the National Assembly at Bordeaux, which, however, he soon quitted in disgust. He then went to Brussels, but the Belgian Government expelled him from the country, and he had to seek refuge in Vianden, a village of Luxemburg, where *L'Année Terrible* was composed. Returning to Paris in July, 1871, he pleaded earnestly but without effect for the lives of the communists. Hugo has given an account of his life in *Actes et Paroles* (1870-72). In 1862 appeared *Les Misérables*; in 1869 *L'Homme qui Rit*; *Quatrevingt-treize* (1874); his *Speeches* (1875); the *Légende des Siècles* (1877); *L'Histoire d'un Crime* (1878); and *Le Pape*, a poem (1878). His main work for social reform has been in these novels, the influence of which has been marked in the development of social democracy in France. He says in his *William Shakespeare*: "True socialism has for its end the elevation of the masses to the civic dignity, and that, therefore, its principal care is for moral and intellectual cultivation."

HULL HOUSE (CHICAGO).—The two original residents of Hull House, Miss Jane Adams (*q. v.*) and Miss Ellen G. Starr, went to commence a work at 335 South Halstead, Chicago, in a poor neighborhood of the city, in September, 1889. Their one thought was that personal social intercourse could best realize their growing sense of the economic unity of society, and all the developments of their work have grown up from this as there seemed to be need. Their earliest activities were the ordinary ones of children's clubs, kindergartens, afternoon

teas, etc., as a means of securing natural acquaintance in the neighborhood.

The Working People's Social Science Club was the first body including men to be organized at Hull House. This club was formed through the activity of an English working man, during the first year of Hull House, for the discussion of social problems, and has continued to meet weekly ever since. The discussion is always animated, and every conceivable shade of social and economic opinion is represented. In 1893 was formed also a Hull House Men's Club. It holds a reception once a month and an occasional banquet. Composed of 150 men of the vicinity, the constitution commits them, among other things, to the "cultivation of sobriety and good fellowship." At present 30 or more clubs meet regularly at Hull House, and every quarter there is a congress of the different clubs.

Clubs.

The Hull House Women's Club, which now numbers 60 of the most able women in the ward, developed from a social meeting of a few for purposes of tea-drinking and friendly chat. Several members of this club have done good work in street and alley inspecting in connection with the Municipal Order League, and have taken an active part in a cooperative coal scheme recently inaugurated at Hull House.

From a like informal origin grew the College Extension courses. These classes were established at Hull House before the University Extension movement began in Chicago, and are not connected with it. Several University Extension courses have been given at Hull House. The first class met as a social club, guests of the residents. As the classes grew larger and more numerous, and the object of newcomers more definitely that of acquisition of some special knowledge, the informality of the social relation is necessarily less. But the prevailing attitude toward the House of the 250 students now enrolled is that of guests as well as students.

The most popular and continuous courses have been in literature, languages, music, art, history, mathematics, drawing and painting. A helpful supplement of the College Extension courses has been the Summer School, held for five years in the building of Rockford College, at Rockford, Ill. The sum of \$3 a week paid by each student for board covers the entire expenses of the school; the use of the buildings, including gymnasium and laboratories, are given free of rent.

Under the educational aspect of the House may be considered the occasional exhibitions of pictures. Owing partly to the limited space available for the purpose, these exhibits have been small.

The first residents held strongly to the belief that compromise in the matter of excellence in art was a mistake. They hung their own walls only with such pictures as they felt were helpful to the life of mind and soul. One of the residents has been able to put a number of good pictures into the school nearest Hull House, and into departments of several other public schools.

Art.

The same principles the House is striving to carry into effect with regard to the music it provides. Every Sunday afternoon a free concert is given in the gymnasium. There is also musical instruction given through the week, with a children's chorus, etc.

The connection of the House with the labor movement may be fairly said to have begun on the same social basis as its other relations. Of its standing with labor unions, which is now "good and regular," it owes the foundation to personal relations with the organizer of the Bindery Girls' Union and of various women's unions, who lived for some months in the house as a guest. It is now generally understood that Hull House "is on the side of unions." Several of the women's unions have held their regular meetings at the House, two have been organized there, and in four instances, men and women on strike against reductions in wages have met there while the strike lasted. In one case a strike was successfully arbitrated by the head of the House, the abuses complained of by the employees being removed.

Trade Unions.

The initiative toward the factory inspection measure of Illinois was taken by a resident of Hull House. The same resident conducted in Chicago the so-called "slum investigation" for the Department of Labor at Washington, and after the passage of the law was appointed inspector of factories for the State of Illinois.

A resident has tabulated the information collected in the "slum investigation" in the form of two sets of

maps, one set on the plan of Charles Booth's wage maps of London, and one set showing the nationalities of the district. The latter shows 19 different nationalities within the third of a square mile lying east and south of Hull House. (See reference at end of article.)

After the passage of the factory and work-shop bill, which includes a clause limiting women's labor to eight hours a day, the young women employees of a large factory in the near neighborhood of Hull House formed an "Eight-hours Club" for the purpose of encouraging women in factories and workshops to obey the eight-hour law. This club, which holds its meetings at Hull House, has maintained its own position, and has done good missionary work for the cause. When the hours were shortened, and work stopped on Saturday, several members of the club devoted their Saturdays to seeking work in candy and tobacco factories for the purpose of making the acquaintance and cultivating the friendship of workers in these shops, and urging them to obey the law; and a number of the latter were brought into the club.

The Jane Club, a cooperative boarding club for young working women, had the advice and assistance of Hull House in its establishment. The original members of the club, seven in number, were a group of girls accustomed to cooperative action. The club has been, from the beginning, self-governing, the officers being elected by the members

from their own number, and serving six months gratuitously. The two offices of treasurer and steward have required a generous sacrifice of their limited leisure time, as well as a good deal of ability from those holding them. The weekly dues of three dollars, with an occasional small assessment, have met all current expenses of rent, service, food, heat and light, after the furnishing and first month's rent was supplied by Hull House. The club now numbers 50 members. The one flat is increased to five. The members do such share of the work of the House as does not interfere with their daily work at their trades. There are various circles within the club for social and intellectual purposes. The atmosphere of the house is one of comradeship rather than of thrift.

One of the residents of Hull House has been appointed a member of the State Board of Charities. The House has been active in the movement to organize the charities of Chicago, and has recently united its relief office with the ward office established by the new organization.

The House has always had a free kindergarten, and for five years a day nursery, where mothers who are obliged to go out to work leave their children for the day, paying five cents for each child. The crèche averages in summer 50 children, and in winter between 30 and 40.

There is also a children's dining-room in a neighboring cottage. Dinners are served to school children upon presentation of tickets which have been sold to their mothers for five cents each. Those children are first selected whose mothers are necessarily at work during the middle of the day, and the dinner started with children formerly in the Hull House crèche. While it is desired to give the children nutritious food, the little diners care much more for the toys and books and the general good time than they do for the dinners. Besides these activities there are various children's clubs, cooking classes, a nature class, sewing school, art classes, a public bath-house, a cooperative association, a gymnasium, playground, coffee-house, New England kitchen with a noon factory delivery, a temporary lodging-house, a labor bureau, etc. A resident physician conducts a public dispensary.

No university nor college qualification has ever been made in regard to residents, altho the majority have always been college people. The organization of the settlement has been extremely informal, the number of residents being now about 20. Residents are received for six weeks, during which time they have all privileges, save a vote at residents' meeting. At the end of that period, if they have proved valuable to the work of the House, they are invited to remain, if it is probable that they can be in residence for six months. The expenses of the residents are defrayed by themselves on the plan of a cooperative club, under the direction of a house committee. A limited number of *fellows* has been established. All the residents of Hull House for the first three years were women, tho much valuable work has always been done by non-resident men. Since men have come into residence in a cottage on Polk Street,

Residents.

dining at Hull House, and giving such part of their time to the work of the settlement as is consistent with their professional or business life. Only one man has been able to devote his entire time to settlement work.

It is estimated that 2000 people come to Hull House each week, either as members of clubs or organizations, or as parts of an audience. One hundred of these come as teachers, lecturers, or directors of clubs. The House has always had much valuable assistance from the citizens of Chicago. This voluntary response to its needs, perhaps, accounts for the fact that it has never found it necessary to form an association with chapters in colleges, as other settlements have done. It is incorporated with a board of trustees.

No rent is paid for the use of Hull House, nor for the adjacent lots. Three buildings have been built upon these by friends of the House. The superintendence and teaching of the settlement are volunteered by residents and others, and are unpaid. The running expenses of the settlement proper are therefore reduced to a minimum. No public appeal for funds has ever been made.

Reference: *Hull House Maps and Papers*, by residents of Hull House (1895).

ELLEN G. STARR.

HUMANITARIAN LEAGUE, THE, was started in England in February, 1891, its object being to advocate humane principles from rational and consistent principles.

The main principle laid down in its manifesto is that "it is iniquitous to inflict suffering on any sentient being except when self-defense or absolute necessity can be justly pleaded." It urges the application of this principle to international warfare, the criminal code, social questions, and all wanton ill treatment of the lower animals, whether for the purposes of fashion, sport, and science, or "those dens of torture known as private slaughter-houses."

Its members direct public attention to the League's purposes, and it has brought out a series of uniform pamphlets at a low price; among others are: *Humanitarianism: Its General Principles and Progress*, by Mr. H. S. Salt, the leading member of the society; *Royal Sport: Rabbit Coursing: An Appeal to Working Men; The Horrors of Sport; Behind the Scenes in Slaughter-houses; Vivisection and Women's Wages*.

HUNTINGTON, FREDERICK DAN, was born at Hadley, Mass., in 1819. He was graduated at Amherst College in 1839, and at Cambridge Divinity School in 1842. Entering the Unitarian ministry, he held a pastorate in Boston, and from 1855-60 was Professor of Christian Morals and preacher at Harvard University. In 1860 he entered the Episcopal Church and became rector of Emmanuel Church, Boston, and in 1869 was consecrated Bishop of Central New York. Besides many religious books, he has written numerous magazine articles on religious and social problems with kindred subjects. He is president of the Church Association for the Advancement of the Interests of Labor (*q.v.*), and of the Church Social Union (*q.v.*).

HUXLEY, THOMAS HENRY, we consider here simply for his contributions to social science. Born at Ealing, Middlesex, England, in 1825, he studied at Charing Cross Hospital and at the University of London. As assistant surgeon in the royal navy he sailed round the world and made many observations in natural science.

In 1854 he became Professor of Natural History in the School of Mines, and Professor of Physiology. From 1863-69 he was professor in the Royal College of Surgeons. He was president of various scientific societies, from 1870-72 on the London School Board, and in 1893 privy councillor. He has been a careful student of biology, yet few men have done more to popularize science by his lectures and his numerous writings. Mr. William M. Salter thus describes his social positions (we abridge his account):

"Huxley held to what might be called a reasonable individualism—*i.e.*, the view that it is better to leave men as free as possible, so long as their action is not incompatible with social welfare. But what he termed 'fanatical individualism,' which questions whether society may constrain one of its number to contribute his share toward maintaining it, or even whether it may prevent him from doing his best to destroy it, found in him a keen opponent; he called it 'reasoned savagery.'

"Society, he held, came into being when mutual war gave way to mutual peace—and it 'most nearly approaches perfection as the war of individual against individual is most strictly limited.' The 'eternal competition of man with man and of nation with nation' did not please him. He put his hand on the weak spot in the laborer's situation when he said that it is the competition of laborers with one another that makes the capitalist's strength.

"As to what is called the social problem' he felt deeply. He thought there were some to whom society assured quite too much and others to whom it assured too little. He had something rather sharp to say of those artificial arrangements by which fools and knaves are sometimes kept at the top of society, instead of sinking to their natural place at the bottom.

"He thought society might act in various ways for the good of its members—*e.g.*, by providing proper drainage in crowded cities, by establishing libraries, schools, and gymnasia, by factory legislation, by regulating not only the production, but the distribution of wealth—as it already does in a measure by its laws of inheritance, tho it might do much better in this particular.

"Huxley was no optimist, and yet he saw no limit to the extent to which 'intelligence and will, guarded by sound principles of investigation, and organized in common effort, may modify the conditions of existence for a period longer than that covered by history.' With due regulation of its numbers and due ordering of its industrial life, Huxley thought that a society might even now eliminate poverty and want (save such as arose from moral delinquencies or unavoidable calamities). Whether any society would actually rise to this height remained, of course, to be seen. Huxley was only sure that if some advance was not

made in this direction, it was an open question whether the life of the race was worth preserving. If there was no hope of a large improvement of the condition of the greater part of the human family, he declared he should welcome the advent of some kindly comet that would sweep the whole affair away."

HYNDMAN, HENRY MAYERS, was born in 1842, and was educated at Trinity College, Cambridge. Taking his degree in 1864 he entered the Inner Temple in 1865, but as special correspondent for the *Pall Mall Gazette*, went through the Italian campaign of 1866. From 1868-70 he traveled through the United States and Australia. In 1877 he published books on *The Indian Famine* and the *Crisis in India*, which brought prominently into public notice the appalling condition of Indian affairs. At the general election of 1880 he was an unsuccessful independent candidate for the parliamentary seat of Marylebone, London. In the same year, with several others, he raised an agitation in England against Mr. Gladstone's "coercion policy" in Ireland, and several times he had narrow escapes from being mobbed by the Liberals for his outspoken denunciations. In January, 1881, was founded, mainly through his efforts, the Democratic Federation, which soon became a distinctly socialist organization, and grew into the Social Democratic Federation. From that time forward he has been closely identified with this organization, speaking and writing unceasingly. In 1886 he was tried, with Messrs. Burns, Champion, and Williams, for "uttering seditious and inciting to violence" in a speech made at a meeting of the unemployed in Trafalgar Square. After a trial lasting three days they were all acquitted. His first socialist publication was *England for All* (1881), followed by *The Historic Basis of Socialism in England* (1883); *The Social Reconstruction of England, a Summary of the Principles of Socialism* (1884). He is still the leading member of the Social Democratic Federation, and constantly contributes to *Justice*, its organ. A man of some means, no one has more absolutely devoted his whole life to the cause of socialism.

I.

IBSEN, HENRIK, was born at Skien, Norway, March 20, 1828. Apprenticed to a druggist, he early left the pharmacy for literature. In 1854 he was appointed director of the theater at Bergen; in 1857 at Christiania. In 1866 he received a pension and resided abroad at Dresden, Munich, and Rome till 1891, when he returned to reside at Christiania. His first drama, *Catilina* (1850), was not considered a success, tho with marks of genius. He then turned to Norwegian historical subjects and found great success, and followed these by some satirical dramas, which have had still more popularity in Norway, and have been translated into most European languages. With *The Pillars of Society* (1877) Ibsen began a series of realistic pictures satirizing every-day life that have made

him famous the world over. This was followed by *A Doll's House* (1878); *Ghosts* (1881); *An Enemy of the People* (1882); *Hedda Gabler* (1890); *The Master Builder* (1892), and other dramas less known. These productions have been attacked as immoral, and have been lauded as of the highest genius. They have done good service for social reform by showing some of the shams and weak spots of respectable society, as in part due to present economic conditions. See G. B. Shaw's *Quintessence of Ibsenism* (1891).

ICARIA, a communistic settlement begun in 1847, to embody the social ideals described in Cabet's romance *Voyage en Icarie*. Cabet (*q.v.*) wrote his romance in 1839, and then,

pressed by his friends, sought for an opportunity to carry out his ideas. He finally succeeded in making arrangements for an experiment on American soil. In his journal, *Le Populaire*, he announced the purchase of a considerable tract of land on the Red River, Tex., and a treaty by which Cabet was made the director of an intended colony, and the depository of all the funds, community of property being the distinctive principle of the society. Accordingly, in 1848, an expedition of 69 persons sailed to America as an advance guard, leaving Cabet himself and another company to follow soon after. But difficulties arose. They were attacked by the yellow-fever, and, unable to endure the Texan climate, the survivors were obliged to abandon their claims and return to New Orleans. Here Cabet met them, with 400 additional members. News, however, had been received in New Orleans of the proclamation of the republic in France, and many felt tempted to return. Cabet was denounced, but induced several hundred to keep on. Learning that the Mormons had abandoned their settlement in Nauvoo, Ill., he set out for that place with his followers. The Icarians in Nauvoo numbered at one time 600. They met with some success in cultivating their land, established shops, pursued trades, and set up a printing-office; but instead of rejoicing in his prosperity, and laboring to increase it, Cabet was dreaming what he might do if he had half a million, as is evinced by his publication *Wenn ich \$500,000 hätte*.

It is said that Cabet developed a dictatorial spirit; but this is doubtful. He was in a difficult place, and had many rivals and enemies. He was even summoned back to Paris on a trumped-up charge of fraud, but was able to successfully defend himself before the tribunal. Returning to Nauvoo, he found it prospering; but dissension again arose, and Cabet was expelled. He went with some of his followers to St. Louis, where he died (1856). His followers founded a colony at Cheltenham, which, however, did not endure. Meantime, the faction which had remained at Nauvoo, after many years of struggle, decided to remove, and 4000 acres were bought by the Nodaway River, in Adams County, Ia., in the town of Corning, and the colony moved there. Dissensions were, however, not over, and in 1880 two factions—the Young Party and the Old Party—having failed to live together, separated. The property was equitably divided by arbitrators; but through a technicality the old charter was lost, the Young Party obtaining a new one and the right to the name, with the original settlement; the Old Party found themselves obliged to found a New Icaria a mile farther east. The Young Party soon dissolved. The Old Party continued, but finally disbanded in 1895.

The essential principles of Cabet's communism were the equality of all and the brotherhood of man. Executive officers were elected every year, who were, however, only empowered to execute the orders of their fellow-citizens, and could not so much as buy a bushel of corn without being authorized to do so by the society. The directors bought the goods needed by the Icarians twice a year at wholesale. Each one

made known his wants previously to the semi-annual purchases. "To each according to his needs; from each according to his ability" was the economic doctrine of the community. Marriage was essential according to Cabet's scheme, and wives highly honored. Not only was the strictest fidelity enjoined upon the husbands, but they were required to render special acts of homage to their wives.

The government was purely democratic. Concerning religion, the constitution of the community said: "The Icarian Community adopts as its religion the religion of Christianity in its primitive purity, and its fundamental principle of fraternity of men and of peoples." Sunday was set apart as a day of rest and recreation. Walking, riding, visiting, fishing, and dancing, with occasional amateur theatricals, were the amusements. In addition to the national holidays they celebrated two of their own, February 3, or the anniversary of the founding of the community, and the "Fête de Mais," or corn festival.

They lived in little houses in plots of ground bright with flowers around a central house, where they had their meals in common. They at one time published a little paper, the *Revue Icarienne*.

ILLEGITIMACY.—In studying the subject of illegitimacy at least three things must be remembered. First, that the proportion of illegitimate to legitimate births in any country is by no means an index of the morality of the country. A country may have a high rate of illegitimacy not because morals are low, but because of the law. There is probably a lower rate of illegitimacy in Turkey than in England; but few would argue that Turkey is the more moral country of the two. The simple reason is that in Turkey polygamy and frequent change of wives are allowed by the law. Bavaria in former times had laws forbidding marriage except to those possessed of property or who were members of a guild. The natural result was an enormously high rate of illegitimacy. When the laws were changed, about 1868, the proportion sank in a few years nearly 50 per cent. Lord Kames states that in 1707, Iceland having become almost depopulated by an epidemic, the King of Denmark issued a proclamation legitimizing all children to the extent that no unmarried mother was to be deemed to have lost her reputation until her progeny exceeded six. Again, a low rate of illegitimacy may obviously prevail in a country because there is a high rate of antenatal destruction of life, or a frequent practice of neo-Malthusianism. (See MARRIAGE; MALTHUSIANISM.) This may be the reason why illegitimacy in some countries like England seems more prevalent in rural than in urban districts. This may be the reason, too, why certain sections of Scotland have a higher rate of illegitimacy than France.

The second point that must be remembered is that even where a high rate of illegitimacy is caused by laxity in morals, it does not always imply low morals in all directions. Miss Mulock, in *Thoughts about Women*, says:

"Women who thus fall are by no means the worst of their station. I have heard it affirmed by more

than one lady, and by one in particular whose experience is as large as her benevolence, that many of them are of the very best—refined, intelligent, truthful, and affectionate.

“I don't know how it is,” she would say, “whether their very superiority makes them dissatisfied with their own rank, so that they fall easier victims to the rank above them, or whether other virtues can exist and flourish entirely distinct from and after the loss of what we are accustomed to believe the indispensable virtue of our sex—Chastity.”

Froude says (*History of the English in the West Indies*, p. 344):

“Immorality (in Hayti) is so universal that it almost ceases to be a fault, for a fault implies an exception, and in Hayti it is the rule. Young people make experiment of one another before they will enter into any closer connection. *So far they are no worse than in our own English Islands, where the custom is equally general.*”

The third point applies to all statistics, but especially to statistics of morals, and among statistics of morals, particularly to statistics concerning chastity, that a high rate of evil may simply indicate a careful registry and a high social standard, so that low morality and good appearances not seldom go together. Remembering these precautions, the following statistics, taken, unless otherwise indicated, from Dr. Albert Leffingwell's *Illegitimacy*, are of great value.

ILLEGITIMACY IN EUROPE.

Of each 1000 births (still-births excluded) the

	1857.	1858.	1867.	1868.	1877.	1878.	Ten Years, 1876-85.
Northeastern Counties	145	146	145	153	139	139	141
Northwestern Counties.....	57	61	61	61	65	59	64

He asks :

“Why do these two sections differ, and differ so enormously? Why does one locality persistently and regularly pay twice the tribute of bastardy of its neighbor, year after year?”

He says it is not because of differences in education, since in 1878 94 per cent. of the married women in the northeastern division were able to write, while in the other only 33 per cent. of the whole number who married could sign their names. It was not due to poverty, because in no portion of Scotland do so small a proportion of the population live in cottages of

following were illegitimate in the different countries in the years mentioned :

	1869.	1870.	1885.	1886.	1887.	1888.	1889.

According to the *Bulletin de l'Inst.*, etc., vol. vii., illegitimacy is increasing in Italy, France, Austria, Hungary, Belgium, Roumania, Servia, and Massachusetts, and decreasing in England, Scotland, Holland, Norway, and Denmark.

The rate of illegitimacy seems to differ steadily and unaccountably in different portions of the same country.

Dr. Leffingwell gives the following table of the number of illegitimate births per 1000 in two sections of Scotland :

a single room. It cannot be due to religion, because both sections cherish the stern faith of Calvin and Knox. Dr. Leffingwell says :

“It seems to me that the most plausible explanation of this remarkable local proclivity toward immorality is that it is primarily due to ancestral tendencies, coming, it may be, from prehistoric times. Probably the immediate and active cause to-day is the contagion of loose example, the near inheritance of unwise proclivity.”

In English counties the rates also strangely vary. Here is a table of certain English counties :

DIVISIONS AND COUNTIES.	1879.	1880.	1881.	1882.	1883.	1884.	1885.	1886.	1887.	1888.	10 Years Average.

* Including still-births for 1885-89.

Says Dr. Leffingwell :

"This is the record of 10 years. Every year one section of the country pays twice the tribute of another part; and yet both sections are equally under English laws, English customs, English civilization. What, one may well ask, are the influences, the circumstances, the conditions, which produce such surprising contrasts between the social morality of Devon and Norfolk, or Surrey and Shropshire?"

In Prussia, Pomerania and Silesia have a very high rate of illegitimacy, altho one is agricultural and the other mining and manufacturing. Saxony and the Rhine provinces have rates of illegitimacy of 9.36 and 3.76 per cent. of the total number of births, altho both are industrial regions (R. Mayo-Smith's *Statistics and Sociology*, Book I., chap. v.).

According to some, illegitimacy is larger in cities than in the country. According to others, the contrary is the case. For France, Levasseur (*La Pop. française*, II., p. 34) states the percentage of illegitimate births for 1879-83 in the Department of the Seine as 24.1, and among the urban population generally 10.1, while in all France it was 7.4 and in the rural population 4.2. In Germany, in 1890, the illegitimate births in the cities numbered 13.2 per cent., and in the country only 9.1 (*Jahrbuch der deutschen Städte*, 1892).

In England, illegitimacy, according to Dr. Leffingwell, prevails in the country more than in the cities. He says (p. 31):

"The great cities of England nearly all show a proportion of illegitimate births below the rate prevalent in certain agricultural and rural districts inhabited

by an honest, sober, industrious, and estimable population. Contrast, for instance, the number of illegitimate in every 1000 births, as they occur in the three principal cities of England, with the rate which obtains in some of the most beautiful of rural resorts."

Illegitimacy, according to Dr. Leffingwell, is not due primarily to poverty. He says (pp. 26-31):

"There can be no doubt that wealth, or at least a competence, does secure to its possessors certain safeguards against temptations which assail not only the hungry and homeless, but those who are struggling for daily bread.

"And yet it is perfectly evident that poverty of itself does not predispose to vice or to looseness of morals. We hardly need statistics in proof of this, and yet they confirm the general belief. If we look at those sections of the United Kingdom where poverty is most hopeless and pressure for the barest necessities of life the strongest, it is there in very many instances that we find the least tendency to illicit relations, so far as these are measurable by their most natural result.

"In Ireland, for example, we find the rate of bastardy less than that in England or Scotland. Yet no one can question the misery in which the Irish peasantry has been steeped for centuries. But some parts of Ireland are exceptionally poverty-stricken, and

COUNTY.	No. of Illegitimate Births each Year.										
	1879.	1880.	1881.	1882.	1883.	1884.	1885.	1886.	1887.	1888.	Total.
Mayo.....	31	51	29	34	33	28	36	23	30	27	322
Down.....	337	287	328	322	284	269	312	322	331	292	3,084

some sections, measured by an Irish standard, exceptionally prosperous. Two counties, Mayo and Down—one on the bleak and barren coast of the Atlantic, the other in prosperous Ulster—each containing by the census of 1881 about the same number of inhabitants, present a contrast which is worth a moment's special study. . . .

"I have carried out these figures for so long a period that the reader may see that the phenomenal preponderance of bastardy in Down was persistent year after year. Compare now the proportion of these births to the total number born:

COUNTY.	Total Births 10 Years, 1879-88.	Total Number of Illegitimate Births.	To 1,000 Total Births, how many Illegitimate?
Mayo (Connaught).....	57,741	322	5.6
Down (Ulster).....	60,346	3,084	51.1

"What do these figures reveal? On the one hand we have a section of prosperous and happy Ulster, wherein the average rate of illegitimacy for 10 years was 51 per 1000 births, greater than that in England and Wales; while the wretched land of barrenness and bog shows a ratio less than any county in England, Scotland, or Ireland, and possibly less than elsewhere in Europe. If we look at the relation between illegitimate births and the unmarried and nubile womanhood between ages of 15 and 45, we shall see a somewhat modified result, yet practically the same."

	No. of Unmarried Women Living between Ages of 15-45.	To 10,000 Unmarried Women 15-45, how many Illegitimate Births Annually During 10 Years, 1879-88?
Mayo (Connaught).....	29,069	11
Down (Ulster).....	34,330	90
All Ireland.....	731,767	44

It is not due to religious differences. Says Dr. Leffingwell (pp. 41-42):

"Does the reader believe that the highest appreciation of chastity depends upon the spiritual acceptance of Calvinistic theology; in reverence for the sanctity of the Sabbath, and abhorrence of the Papacy? Let him ponder over the statistics of Scotland, and explain why this land of strictest Sabbath keeping and purest Calvinism exhibits double the illegitimacy of England every year. Does he hold that the pre-eminent excellence of the theology of Martin Luther is evidenced by the morality of its believers? Let him study the records of Norway, Sweden, and Denmark, where Lutheranism for centuries has held undivided sway. Does he claim that the infallible creed of the Roman Catholic Church insures its adherents superiority in morals? Then upon this hypothesis he must explain why Austria and Bavaria are so low down on this scale. Is it, then, to believers in the 39 articles of the Established Church of England that we are driven to

look for freedom from frailty? But where in England is the rate of illegitimacy so low as in Russia or in Greece—not to speak of Ireland at her side?"

In Prussia, in 1875-81 the number of illegitimate children among evangelical mothers was 8.85 per cent. ; among Catholic mothers, 5.64 ; among Jewish mothers, 2.73 per cent. (*Zeitschrift des Preuss. Bureau*, 1882, p. 232).

It is not due to lack of education. Dr. Leffingwell says (pp. 36-38) :

"Many countries where popular education is widely diffused among all classes, such as Denmark, Norway and Sweden, Prussia, Saxony, and Scotland, show a high rate of illegitimacy, while in some others, such as Russia and Ireland, the rate is very low. . . .

"Of the number of women married in Kirkcudbright, a county in Southern Scotland, 99 per cent. are able to write their names in the marriage register ; showing a larger proportion of women thus far educated than in any country of Europe or any county of England or Wales. Yet the rate of bastardy which there annually prevails is, year by year, greater than in any one of the 89 departments of France, Paris only excepted! . . .

"In France, putting Paris aside, those departments where ignorance of the alphabet is most general are in many cases the very ones which hold the virtue of chastity in highest esteem. Finisterre, for example, of the 89 departments of France, stands first for the ignorance of the male population and first for the illiteracy of its women ; yet its rate of illegitimacy during the period observed was but 34 per 1000 births ; less than that which prevailed during the same time in any one of the counties of England, Wales, or Scotland."

Dr. Leffingwell concludes that a high rate of illegitimacy is mainly due to law and to heredity. He says (pp. 47, 50-52) :

"I think it perfectly evident that if throughout Europe all obstacles to marriage were abolished ; if parental prudence were given no power to oppose ; if all that is necessary were simply the registration of intention before a public official qualified to take acknowledgments, an act of recognition obtainable at all times, publicly or privately, by rich or poor, *without fee or cost of any kind*, it would undoubtedly add to the greater frequency of the legal tie among the poorer class, and decrease in very great proportion the prevalence of illegitimate births. . . .

"But of all causes of human conduct, one of the most potent is probably the predisposition that lies wrapped in organization, and which is passed onward by inheritance. . . .

"It will be noted that, with few exceptions, the northern nations of Europe of Scandinavian or Teutonic origin apparently show the strongest proclivity to those ante-marital irregularities of which illegitimacy is a sort of gauge. Why should it be so prevalent in Norway, Scotland, Iceland, Sweden, Finland, Denmark, Prussia, Saxony, Austria, and Bavaria? Chiefly upon hereditary predisposition or organization persistent through successive generations of families."

Contrary to the above views is the position held by many in the United States that easy marriage, while it may lower illegitimacy, increases divorce. Very many biologists, too, question the influence of heredity. (See DIVORCE ; HEREDITY.) It has been argued that the high rate of illegitimacy prevailing in most Teutonic or Scandinavian countries indicates not a low morality so much as the absence of the custom of neo-Malthusianism. Undoubtedly, in any case, the rate of illegitimacy depends upon the social customs of a people far more than on economic grounds. In Scotland and in Eastern Prussia a birth before marriage is lightly esteemed if the child be legitimized by a subsequent marriage.

In Denmark, with regard to the peasant population of the rural districts . . . it was found that of 100 first-born children no less than 39 were born under seven months after marriage, to which must be added

9 per cent. born between seven and nine months after marriage. A great number of the brides who were not pregnant at marriage had already had illegitimate children with the bridegroom or others ; so that it may probably be assumed that *in two thirds of the marriages* (childless marriages excepted) *the bride had had children while unmarried, or was pregnant at the marriage.* (Westergaard on *Marriage Statistics of Denmark*, Copenhagen. Translation furnished to Seventh International Congress of Hygiene and Demography.)

In regard to the lessening of illegitimacy, most individualists would lessen it by raising the moral sense of the individual. Socialists would add to this economic changes, making it economically possible for men and women to marry early, but above all making it economically easier for every married couple to bring up its family in good, healthy homes. Dr. Mayo-Smith (see above, p. 84) states that there is very little illegitimacy among young women living with their parents.

Reference: *Illegitimacy and the Influence of Seasons upon Conduct*, by Albert Leffingwell, M.D. (1892). (See also PROSTITUTION ; MARRIAGE ; DIVORCE.)

ILLITERACY. (See EDUCATION.) We give here some of the reported facts as to illiteracy. All comparative tables of illiteracy are exposed to the greatest difficulties, owing to the varying degree of accuracy and the different basis of the statistics of illiteracy in different countries. Our facts for Europe are based upon Dr. R. Mayo-Smith's *Statistics and Sociology*, p. 196, and are taken for the sake of uniformity for the years 1880-82, and refer to illiteracy among recruits, except for England, Scotland, and Ireland, where bridegrooms are taken, and the United States, where males from 15-21 are taken as the class nearest the recruits.

The most illiterate countries in Europe are the Slavonic countries. Russia has a percentage of illiteracy of 78.8. The colored population of the United States has a percentage of 62.1. Hungary's is 58. Next in illiteracy come the Roman Catholic countries of Italy, Austria, and Ireland. The percentage of illiterates in the latter is 27.6. Considerably higher stand Belgium (15.9), France (14.9), and England (13.2). The white population of the United States have a percentage of 7.7. The following countries have less illiteracy than the United States : Scotland (6.8), Switzerland (2.5), Germany (1.6). Sweden and Denmark have only .04 of their population illiterate. According to Muhlhall (1889), the ratio of those unable to write to the total population was : England, 9 ; Scotland, 6 ; Switzerland, 5 ; Germany, 4 ; Scandinavia, 3.

Professor Mayo-Smith considers such statistics, tho perhaps the best which can be had—since few countries take a census of illiterates—nevertheless more or less misleading, because recruits and those able to marry are a select class, and the statistics do not show the great illiteracy of the very poor—paupers, criminals, and defectives. Again, in many countries the young who marry and all the recruits are much more literate than the old. In Belgium, the lowest number of illiterates is among persons of 15 to 25 years of age, while of those over 60, 50 per cent. are illiterate.

The statistics of illiteracy for the United States, according to the census of 1890, were as follows :

STATISTICS OF ILLITERACY IN THE UNITED STATES.

CENSUS OF 1890.

STATES AND TERRITORIES.	POPULATION, 10 YEARS OF AGE AND OVER.			WHITE POPULATION, 10 YEARS OF AGE AND OVER.			NATIVE WHITE POPULATION, 10 YEARS OF AGE AND OVER.			FOREIGN WHITE POPULATION, 10 YEARS OF AGE AND OVER.			COLORED POPULATION,* 10 YEARS OF AGE AND OVER.

* Persons of negro descent, Chinese, Japanese, and civilized Indians.

Many countries considered illiterate are making wonderful advances. According to Dr. R. Mayo-Smith's *Statistics and Sociology*, in 1841, 53 per cent. of the population of Ireland over five years of age could not read and write; in 1891 this was only 18 per cent.

IMMIGRATION.—The dictionary definition of immigration makes it to consist in moving from one country to another for the purpose of *permanent residence*. But this, tho perhaps correct as a definition, is not correct as regards

the practical social problem that confronts us when we speak of the evils or advantages of immigration. Especially in the United States the trouble is largely not from those who come expecting to remain permanently and to become citizens, but from those who come without the slightest thought of permanent residence. On the Pacific and Atlantic coasts the main problem has arisen from such as the Chinese, or the Italians, who come to us, perhaps for 10 years, willing to live on the lowest level which can sustain life if they can save money (and it need

not be a large sum) which will enable them to return to their native land and live there in comparative affluence.

The problem of immigration is not, however, peculiarly an American one. It is a universal concomitant of the increasing restlessness of the labor world coupled with increasing ease and cheapness of travel. The immigration into London from Germany and from Russia is today of a size almost beyond belief for those who have not studied the question. Every English colony, every new country, and almost every old country has its immigration problem. Most English colonies have passed anti-Chinese immigration acts, or have attempted to check or control immigration. According to Professor R. Mayo-Smith (*Statistics and Sociology*, chap. xiv.), the immigration to Australia is from 200,000 to 250,000 per annum, mainly British.

Yet certainly no country has such an immigration problem as the United States, and it is

of this problem alone which we in this article treat, as its principal features apply everywhere. It is not a new problem, altho only within the last 20 years has it assumed serious proportions, and only within the last 10 years has it been very seriously mooted to rigidly restrict general immigration. From 1820-91 inclusive, the total immigration into the United States was 16,821,477. From 1789-1820 there are no statistics, but it is estimated to be 250,000. The following table, by decades, will show how rapidly the immigration has increased :

1821-30.....	143,439
1831-40.....	599,125
1841-50.....	1,713,251
1851-60.....	2,570,580
1861-70.....	2,282,787
1871-80.....	2,812,191
1881-90.....	5,236,722
1891-95.....	2,219,793

The following table gives the immigration by years :

YEAR.	Total Alien Passengers.	YEAR.	Total Alien Passengers.	YEAR.	Total Immigrants.	YEAR.	Total Immigrants.

1839.....	68,069	1859.....	118,616				

Of the whole number of immigrants in the fiscal year ending June 30, 1894, 335,752 came through the customs district of New York; 14,311 through Baltimore; 20,245 through Boston; 21,744 through Philadelphia, and 9392 through San Francisco.

Mulhall estimates the number of individuals who emigrated from Europe in 73 years, 1816-88, at 27,205,000. Of these, 15,000,000 came to the United States.

The reported occupations of immigrants who arrived during the year ending June 30, 1894, were as follows: Laborers, 59,575; farmers, 16,452; servants, 28,763; carpenters, 2034; miners, 2505; clerks, 2222; tailors, 3184; shoemakers, 2284; blacksmiths, 1554. The total number of professional immigrants was 1738; of skilled laborers, 33,926; of miscellaneous, 116,187.

In immigration, however, one must consider quality as well as quantity. There has been of late years a great change in the quality of our immigration. The principal European countries reduced their exodus to America very greatly about 1883. The two exceptions are Italy and Hungary, and in the following year Hungary and Russia. Since 1883 the Russian immigration, especially of Russian Jews, shows a constant increase.

Says President F. A. Walker (*Atlantic Monthly*, June, 1896):

"Fifty, even 30 years ago, there was a right-

ful presumption regarding the average immigrant, that he was among the most enterprising, thrifty, alert, adventurous, and courageous of the community from which he came. It required no small energy, prudence, forethought, and pains to conduct the inquiries relating to his migration, to accumulate the necessary means and to find his way across the Atlantic.

"To-day the presumption is completely reversed. So thoroughly has the continent of Europe been crossed by railways, so effectively has the business of emigration there been exploited, so much have the rates of railroad fares and ocean passage been reduced, that it is now among the least thrifty and prosperous members of any European community that the emigration agent finds his best recruiting ground. Hard times here may momentarily check the flow, but it will not be permanently stopped so long as any difference of economic level exists between our population and that of the most degraded communities abroad."

The following table (compiled by the Superintendent of the Census) tells the story down to 1890:

COUNTRIES.	1841-50.	1851-60.	1861-70.	1871-80.	1881-90.

Aggregate.....	1,713,251	2,598,214	2,466,752	2,944,695	5,238,728

As the reports for British North American provinces and for Mexico have been discontinued since 1885 by the Treasury Department, the figures here represented only cover five years of the decade. An estimate based upon the immigration of the years from 1881-85, inclusive, would give 785,604 to British North America for the decade from 1881-90, and 3826 to Mexico, making the aggregate for America 817,563, instead of 422,848.

This table becomes the more alarming when one realizes the percentage of the illiteracy of immigrants from various countries. Of the immigrants in 1891:

England sent	10	per cent.	of her immigrants illiterate.
Ireland	8	"	"
Wales	6	"	"
Scotland	1.5	"	"
France	2	"	"
Germany	2	"	"
Denmark			
Norway			
Sweden			
Hungary	sent	28	per cent. of her immigrants illiterate.
Russia proper	20	"	"
Poland	56	"	"
Armenia	44	"	"
Italy	65	"	"

This, of course, does not mean that Italy has more illiteracy than Armenian-Turkey, but that of the Italians who come to this country a larger percentage are illiterate than of the Armenians who come.

Since 1885 the Irish immigration, once so far

in the lead, has relatively decreased. England alone (not even including Wales) has since 1885 sent a larger number of immigrants than Ireland.

For Chinese immigration, see special article CHINESE IMMIGRATION.

Says President Walker, as above:

"For nearly two generations, great numbers of persons utterly unable to earn their own living, by reason of one or another form of physical or mental disability, and others who were, from widely different causes, unfit to be members of any decent community, were admitted to our ports without challenge or question. It is a matter of official record that in many cases these persons had been directly shipped to us by States or municipalities desiring to rid themselves of a burden and a nuisance; while it could reasonably be believed that the proportion of such instances was far greater than could be officially ascertained."

Another important element of the situation is that the mass of the illiterate immigration does not distribute itself through the country, but settles in great cities, mainly on the Atlantic coast. The Immigration Restriction League of Boston recently investigated this subject. Its published account says in part:

"The following tables are presented as a partial result of a recent visit to the Immigrant Station on Ellis Island, N. Y., made by members of the Executive Committee of the League. . . .

"On December 13, 14, and 15, 1895, about 1000 immigrants over 16 years of age were examined, chiefly Russians and Austro-Hungarians, together with some Syrians, arriving on six steamers from Bremen, Amsterdam, Antwerp, Southampton, and Liverpool. Too few Italians came for tabulation.

"It is believed that the results obtained are characteristic of such immigration throughout the year.

* Not given in 1890.

† Reports discontinued after 1885.

Hungarians.....	76	20	34	4	..	130	4	97	3
Galicians.....	25	12	26	11	5	63	16	80	20
Croats, etc.....	20	8	..	4	4	28	8	78	22
Syrians	21	2	..	4	23	4	85	15
Totals.....	132	89	73	23	14	294	37	89	11

"While little emphasis should be laid on the amount of money brought by an immigrant—as money is no test of an immigrant's real worth, light may be perhaps thrown on the question why the Russians, Galicians, Croats, and Syrians do not or cannot go West, by the statement that of the 331 illiterates examined at Ellis Island, 32, or 10 per cent., brought in no money; 101, or 30 per cent., \$1 to \$5 each; 92, or 28 per cent., \$6 to \$10, and 106, or 32 per cent., over \$10; that is, 40 per cent. of these immigrants had \$5 or less, and 68 per cent., \$10 or less.

"The total amount of money known to have been brought in during the fiscal year ending June 30, 1895, by 160,103 immigrants over 20 years of age was \$4,126,793, an average of \$25.97 per capita over 20 years of age, but an average of only \$16.34 for each of the total number of immigrants for that year.

"Note, however, that of the above 160,103 immigrants 78 per cent., or 125,328, brought in less than \$30, and 34,775, or 22 per cent., brought in more.

"The figures as to average amount per immigrant, \$25.97, as given above, were therefore extremely misleading, because it is evident that a very large percentage of immigrants may have brought in less than \$10; but this would be counteracted by a small number of immigrants bringing several hundreds of dollars, as those who intend to settle on farms do.

"This is clearly shown by the report of the Superintendent of Immigration for 1892, page 26, where he says that, of the 9630 immigrants from Russia arriving at the ports of New York, 333 brought more than \$1000 each, several of these bringing considerable sums of money; one bringing \$25,000, while the 9306 Russians who brought less than \$100 were nearly all destitute."

"With the above caution note that the report of the Superintendent of Immigration for the fiscal year 1892 shows that the 152,360 immigrants over 20 years of age arriving at the port of New York brought \$3,060,908, an average of \$20.09 per capita. Immigrants from

France brought	\$5.67 per capita.

COUNTRIES WHICH SEND US SKILLED LABOR.

(From Report Superintendent of Immigration for 1893.)

"Of the immigrants sent to us in 1893 by the various countries of Europe, but a small proportion were skilled workmen. Thus among immigrants from Scotland there was 1 skilled in 4; from England and Wales, 1 in 5; Belgium, 1 in 7; France, 1 in 9; Germany and Norway, 1 in 10; Italy, 1 in 14; Russia, 1 in 18; Ireland, 1 in 19; Poland, 1 in 23; Austria-Hungary, 1 in 29."

A few other points as to immigrants may be briefly noted. Professor R. Mayo-Smith says (*Statistics and Sociology*, chap. xiv.):

"It would probably be safe to say that at least four fifths of the immigrants belong to the unskilled occupations."

He estimates that between 1881 and 1890 some 21.4 per cent. were under 15 years of age, and 68.1 between 15 and 40. Germany, Russia, and Poland send the most children and families, Ireland the most single young people, Italy and Hungary the most adult laborers. The males form about 60 per cent. of the whole.

Professor Mayo-Smith, by subtracting the total number of passengers departing from the United States between 1881 and 1890 from the total number arriving, calculates the net immigration, and estimates that 15.86 per cent. of the immigrants sooner or later return. By comparing, too, the total number in the United States of each nationality reported by the census of 1890, with the number reported in 1880, and allowing 20 per 1000 as a death-rate, he subtracts the difference from the reported immigration, and so finds how many of each nationality have returned. In the case of Russian Poles, Danes, and Scandinavians, he finds that few return. Of Germans, he estimates that 12,500 per annum return. Of Italians and Hungarians more, while of the Irish still more seem to return, tho he questions the correctness of this.

Perhaps one of the greatest evils has been contract immigration. Says Governor Altgeld (in the *Forum* for February, 1890):

"The condition of the laborer has been made deplorable by the importation of shiploads of men under contract. These do not come with the motives or with the ambition of the class we have been considering; they have no thought of becoming citizens, but are practically slaves, who will work for wages upon which the American laborer cannot exist. Agents for large corporations are constantly importing them. Steamship companies, to get the passage money paid by American employers, bring them over by the thousands, so that many great centers of industry in the East have been filled with them, and the American laborer is being crowded out. Both the native-born and the naturalized laborer have been almost driven out of the great State of Pennsylvania by these importations. True, there is a law against such contracts, but it is a dead letter; so that we have in this country the strange spectacle of the Government keeping up the price of a great many articles by shutting out foreign competition, and at the same time permitting the manufacturers of these articles to import the pauper laborers of Europe to produce them."

The law has been recently more strictly enforced; but this immigration is still an evil.

Concerning the magnitude and the causes of the immigration into the United States, Dr.

Josiah Strong says (*Our Country*, revised ed., pp. 45, 46) :

"America, as the land of promise to all the world, is the destination of the most remarkable migration of which we have any record. During the last 10 years we have suffered a peaceful invasion by an army more than four times as vast as the estimated number of Goths and Vandals that swept over Southern Europe and overwhelmed Rome. During the past 100 years 15,000,000 foreigners have made their homes in the United States, and three quarters of them have come since 1850, while 5,248,000 have arrived since 1880. A study of the causes of this great world movement indicates that perhaps as yet we have seen only beginnings. These controlling causes are threefold: 1. The attracting influences of the United States; 2. The expellent influences of the Old World; 3. Facilities for travel.

"1. The attracting influences of the United States. We have already seen that for every one inhabitant in 1880 the land is capable of sustaining 20. This largeness of room and opportunity constitutes an urgent invitation to the crowded peoples of Europe. The prospect of proprietorship in the soil is a powerful attraction to the European peasant. In England only one person in 20 is an owner of land; in Scotland, one in 25; in Ireland, one in 70, and the great majority of land-

Causes of Immigration.

holders in Great Britain own less than one acre each. More than three fifths of the United Kingdom is in the hands of the landlords, who own, each one, 1000 acres or more. . . . What must free land mean to such a people?

"This, moreover, is the land of plenty. The following table, giving the average amount of food annually consumed per inhabitant, shows how much better the people of the United States are fed than any people of Europe. All kinds of grain are included, as what is fed to cattle serves ultimately to produce food for the population. Potatoes are estimated as grain, at the rate of four bushels to one of wheat.

	Grain, Bush.	Meat, Lbs.
France	24.02	81.88
Germany	23.71	84.51
Belgium	22.84	57.10
Great Britain	20.02	119.10
Russia	17.97	54.95
Spain	17.68	25.04
Austria	13.57	56.03
Sweden and Norway	12.05	51.10
Italy	9.62	20.80
Europe	17.66	57.50
United States	40.66	120.00

"John Rae says that in Prussia nearly one half of the population have to live on an annual income of \$105 to a family. Is it strange that they look longingly toward the United States? . . .

"Every foreigner who comes to us and wins success, as most of them do under more favorable conditions, becomes an advertiser of our land; he strongly attracts his relatives and friends, and very likely sends them money for their passage. Our consul at Frankfurt writes: 'Not less than one half of the German emigrants to the United States emigrate by the advice and assistance of friends residing there.' Says Professor R. M. Smith: 'The Inman Steamship Company has 3500 agents in Europe, and an equal number in this country, selling prepaid tickets to be sent to friends and relatives of persons already here, in order to provide them with passage.' Of course other companies pursue a like policy."

Perhaps a stronger cause of immigration is Europe's expellent influences. We have already referred to the lack of land and of food in the old countries. Taxation to maintain standing armies and requisition for military service, especially in Germany and Austria, drives thousands to this country. In the last 12 years near-

ly three quarters of a million of people have come from Germany alone.

"During 1872 and 1873, which were good years for the working classes of Germany, there were not less than 10,000 processes annually for evasion of military duty by emigration" (Professor Smith's *Emigration and Immigration*, p. 27).

A few years ago a member of the Reichstag exclaimed: "The German people have now but one want—money enough to get to America."

Says Dr. Strong, in *Our Country* :

"In Continental Europe generally the best years of all able-bodied men are demanded for military duty. Germans must be 7 years in the army, and give 3 of them to active service; the French, 9 years in the army and 5 years in active service; Austrians, 20 years in the army and 3 in active service; Russians, 15 years in the army and 6 in active service. When not in active service they are under certain restrictions. In addition to all this, when no longer members of the army, they are liable to be called on to do military duty for a period varying from two to five years. This robbery of a man's life, together with the common expectation that war must come sooner or later, will continue to be a powerful stimulus to emigration; and the 'blood tax' which is required to support these millions of men during unproductive years is steadily increasing. While aggregate taxation decreased in the United States from 1870 to 1880, 9.15 per cent., it increased in Europe 28.01 per cent. The increase in Great Britain was 20.17 per cent.; in France, 36.13 per cent.; in Russia, 37.83 per cent.; in Sweden and Norway, 50.10 per cent.; in Germany, 57.81 per cent. And while the burden of taxation is so heavy and so rapidly increasing, the public debts of Continental Europe are making frightful growth. They increased 71.75 per cent. from 1870 to 1880, since which time they have been enlarged by nearly \$3,000,000,000, and now reach a total of \$20,580,000,000, entailing an annual burden of \$1,000,000,000 for interest.

"The Italians are worse fed than any other people in Europe, save the Portuguese. The tax-collector takes 31 per cent. of the people's earnings! Many thousands of small proprietors have been evicted from the crown lands because unable to pay the taxes. The burden of taxation has become intolerable. Notwithstanding the industrial advance made by Italy from 1870 to 1880, the national debt increased so much more rapidly that the nation was \$200,000,000 poorer in 1880 than 10 years before. For the financial year ending in 1888 there was a deficit in the national treasury of 57,000,000 lire; and for the two years ending in 1890 the budget estimates showed a deficit of 248,000,000 lire. Growing population and increasing taxation are resulting in increased emigration. The total number of emigrants, which in 1884 was 147,000, had increased in 1888 to 200,000.

"Facilities of travel are increasing. From 1870 to 1880, 39,857 miles of railway were built in Europe, only 2000 less than in the United States during the same period; and from 1880 to 1888 there were 26,478 miles built. Thus, interior populations are enabled more easily to reach the seaboard. Instead of a long and tedious passage by sailing vessel, the steamer lands the immigrant in a week or 10 days. We find that steamships, in a single year, make 741 trips from nine European ports to New York, and 144 from other ports of Europe. And some of these ships carry upward of 1000 steerage passengers. Improvements in steam navigation are making the ocean passage easier, quicker, and cheaper. In 1825 the cheapest passage from Europe to America was about \$100. Now the rates from continental ports to New York are from \$23 to \$26. Steerage passage from Hamburg to New York has been as low as \$7.

"Furthermore, labor-saving machinery has entered upon a campaign of world-wide conquest. This fact will render still more operative each of the three classes of influences enumerated above. Wherever man labors labor-saving machinery is destined ultimately to go; and the people of the United States are to make most of it for the world. We have mountains of iron and inexhaustible measures of coal, together with a genius for invention."

With such potent causes of immigration the problem in the United States has grown most

serious, resulting in a strong movement for restricting immigration. There are strong arguments both for and against this. We notice first the reasons for restricting immigration.

1. *The Moral Reason.*—Immigration is morally dangerous. Many immigrants to this country are of the best of Europe, friends of liberty, law, order, and religion. But many are not. Too frequently the immigrant is a European peasant whose horizon has been narrow, whose moral and religious training has been meager or false, and whose ideas of life are low. Not a few belong to the pauper and criminal classes. Some countries of Europe deliberately, and other countries almost equally, send their discharged convicts to America, while fugitives from justice continually seek our shores. The census of 1890 shows that 20 per cent. of the population of this country is practically foreign, and this one fifth furnishes more than half the inmates of our reformatories, over one third of our convicts, and very nearly three fifths of all the paupers supported in almshouses. (But see CRIME.)

Even of those immigrants who are not of the criminal class, a large number, escaping from the restraints of family, of acquaintance, of priest rule, of State rule, in the old countries, mistake license for liberty in this country, and morally deteriorate.

There are also two sides to the fact which must be admitted, that the Roman Church is losing her power over the children of Roman Catholic immigrants. Are the restraints of morality not also losing their power?

Foreigners fill the slums in our cities and congregate even in the country. Already the Territories have a foreign population greater than the States east of the Mississippi.

Says Dr. Strong :

"In 1845, New Glarus, in Southern Wisconsin, was settled by a colony of 108 persons from one of the cantons of Switzerland. In 1880 they numbered 1060 souls; and in 1885 it was said, 'no Yankee lives within a ring of six miles round the first built dug-out.' This Helvetic settlement, founded three years before Wisconsin became a State, has preserved its race, its language, its worship, and its customs in their integrity. Similar colonies are now being planted in the West. In some cases 100,000 or 200,000 acres in one block have been purchased by foreigners of one nationality and religion, thus building up States within a State, having different languages, different antecedents, different religions, different ideas and habits, preparing mutual jealousies and perpetuating race antipathies. In New England conventions are held to which only French Canadian Catholics are admitted. At such a convention in Nashua in 1888, attended by 80 priests, the following mottoes were displayed: 'Our tongue, our nationality, and our religion.' 'Before everything else let us remain French.' If our noble domain were tenfold larger than it is, it would still be too small to embrace with safety to our national future little Germanies here, little Scandinavias there, and little Irelands yonder."

2. *The Political Danger.*—The corruption of American politics, especially the corruption of our municipal politics, is notorious. The corruptors may be the political "boss," the saloon politician, the heeler; back of these, using these, seemingly almost compelled to use these, may be the great corporations and monopolies pouring out their thousands and their millions to elect their tools or to purchase men already elected (see CORRUPTION); yet tho these

be the corruptors, it takes people to be corrupted, and this immigration supplies.

The result of a national election may depend on a single State; the vote of that State may depend on a single city; the vote of that city may depend on a "boss," or a capitalist, or a corporation; or the election may be decided and the policy of the Government may be reversed by the liquor or the immigrant vote.

Can we afford to welcome to our country, with its democratic institutions, the illiteracy now pouring into our cities? Said a pregnant writer recently: "America may be the asylum of the oppressed, but it does not follow that she must be at once an insane asylum, a hospital, and a prison."

In contradiction to both the above arguments, Governor Altgeld of Illinois (*Forum*, February, 1890) shows what immigrants have done. He says:

"But for the assistance of the immigrant the election of Abraham Lincoln as President of the United States would have been an impossibility, and had the cry, 'America for the Americans,' prevailed at an earlier period of our history, the nineteenth century would never have seen the great free republic we see, and the shadow of millions of slaves would to-day darken and curse the continent. . . .

"The facts are that in every State carried by Lincoln there was a large foreign population, which was mostly, and in some States entirely Republican, and which continued to be Republican down to a very recent date; and if the vote of this class had been omitted in 1860, it would have reduced Lincoln's vote to such an extent as to defeat him in most of the States that he carried. I am speaking only of the foreign-born voters; but, as already shown, to these should be added a large percentage of the people who, altho native-born, are of foreign-born parentage, and must be considered with them in viewing the general political course of immigrants. There is not a swamp or field or dark ravine where treason made a stand but is covered with the graves of Germans and of Scandinavians who died for the principle of equal rights. Tho the Irish more generally voted the Democratic ticket, yet their patriotism was prompt to respond to the call of their adopted country, and there is not a battle-field where blood was shed for the Union that has not the bones of Irishmen rotting upon it."

3. *The Industrial Danger.*—This is perhaps the greatest danger. Under competitive trade producers must produce cheaply. To do this they must pay the lowest wages for which they can get the requisite grade of work. To a certain extent high labor is cheap labor, because well-paid men can turn out more and better work. But there is a limit to this, and more and more are machinery and invention enabling unskilled and cheap labor to produce that which undersells, in amount at least, skilled work. As a matter of fact, every factory town sees the survival of the unfit. Irishmen drive out Americans; French Canadians, Irishmen; Poles and Hungarians, French Canadians; and so on to the lowest. This is particularly true in certain lines of industry. Of the clothing trade, it was recently written:

"Has it come to this, that the guests of the nation shall make tramps of the original proprietors? That American women, who have been brought up to the trade, and worked many years at the business (and we have such in our shop), should be denied the right to an honorable living? And shall our clothing be made exclusively by those who are content to wallow as a hog in a sty?"

"While we have no prejudices against class or nationality, but give all suitable persons an equal footing in our shop, yet we must insist that the early

should have and maintain equal rights with the later comers."

In contract labor (*q. v.*) lies a great evil. According to an investigation made by the United States Commission of Immigration, Italian padroni undertake to supply contractors of municipal or corporation work with laborers. They go to the Italian immigrants on arrival and offer them work at rates that seem to them, fresh from Italy (*q. v.*), large. The padroni seem their best friends; they contract to live in the houses of the padroni and to buy at their stores.

According to statements of the commission printed in the *Congressional Record*, 1896, p. 5983, a typical case is where a padrone kept \$1 a head for finding 215 men work, paid their fare to the place of work in advance (\$7 each); there he lodged the 215 men in huts of 3 rooms each, charging them \$1 a month each, though he only paid \$25 a month for the 9 huts and a store, clearing thus \$190 a month. All supplies had to be bought at his store, on a penalty of a fine of \$5 for disobedience. He charged 10 cents for each 5-cent loaf of bread, 10 or 12 cents a pound for meat that could be bought at wholesale for 4½ cents, and so on. Purchases averaged \$8 a month for each man, out of which a 25 per cent. profit (and it was much more) would be \$600 with the board, giving the padrone over \$1000 per month. Yet this labor is displacing American-born labor.

Perhaps still worse is the labor formerly introduced by corporations into the anthracite regions of Pennsylvania to drive out the American miners. Here Italians and Slavs will labor for 80 or 90 cents a day (to them good pay), living in hovels, contracting scurvy by a steady diet of cheapest salt pork, with sore eyes and bodies from owning no towel or wash-tub, having fever from lack of any of the most primitive sanitary arrangements. To a less extent the same thing happens wherever the corporations or municipalities introduce contract labor. Said an employer: "I paid \$1 a head to get such men here. I would pay \$20 per head to get them out."

We next consider the reasons for not restricting immigration.

1. *There is no need.* This country, we are told on good authority, can support 2,000,000,000 of people, while to-day we have only 65,000,000. There is room for millions more. What we need is more men to till our prairies and to develop our unequaled natural opportunities. America need not stop the coming of men. Even if

Arguments against Restriction.

many of them be densely ignorant and incompetent, American schools can educate at least their children, and American life can lead them into valuable citizenship. The assimilating power of American civilization has not yet failed; why should we fear for it now?

But to this it must be said that while America doubtless can support a much larger population, the immigrants that come do not and at present cannot be made to scatter over all the land, but gather in our cities, breeding in disease, ignorance, and filth. Again, while our life may be able to assimilate millions more, it is quite another thing to say that we can assimilate so many at one time as have recently come to us.

A second argument for not restricting immigration is the good that immigration has done this country and our dependence upon it. Commissioner Knapp, formerly Commissioner of Emi-

gration at New York, by a computation based partly on the price of slaves and partly on German estimates as to the cost of rearing German laborers, once fixed the value of the average immigrant to this country at \$1125. The indirect beneficial effects, however, of the immigration, which alone has rendered the rapid development of the United States possible, are still further beyond estimate. Every kind of skilled and unskilled labor has been introduced to add to the productive power of the country. The records of the Bureau of Statistics show that in the years from 1873-83 the principal occupations of the immigrants were:

Professional occupations.....	25,343
Skilled occupations	455,049
Miscellaneous occupations.....	1,588,246
Occupations not stated.....	81,223
Without occupations.....	1,997,019
Total immigration.....	4,147,780

The laborers of every class are scattered throughout the land. The Lake States of the Northwest have no population more industrious and more efficient in agricultural pursuits than the Scandinavians, who form a large proportion of the community. Much of the railroad building, which has been a chief instrument in developing the country, would have been impossible but for the labor of immigrants, who endure drudgery that the natives of this country are unable or unwilling to undergo. The quick invention and adaptability of the Irish, the economy and industry of the Germans, the sturdy qualities of the Scandinavian character, and the varied excellencies of the other component parts of our vast foreign-born population have been of incalculable advantage. Without the added population and wealth which immigration has brought the growth of the country would have been slow indeed. All of which is made an argument by some for not restricting the immigration. But it is really only an argument for not absolutely preventing immigration, which no one proposes to do. It is quality we want, not quantity.

A third argument, sometimes raised, for not restricting immigration is that our danger is not from the poor, but from the wealthy. Said Wendell Phillips: "In combining, perpetual, legalized private wealth lies our danger to-day;" many believe that the rich men of this land are "our dangerous class;" that Newport and Saratoga, Lenox and Wall Street are the centers of our social and national corruption. Nor is it only labor leaders who say this. Says Professor R. T. Ely:

"It is unscrupulous wealth which rules and corrupts our cities. What influence, comparatively speaking, have working men in our politics? Was Jacob Sharp a wage-earner? Were the manipulators of the West End scandal in the Massachusetts Legislature dwellers in the slums of Boston? Does any sane man in Baltimore who wishes to work a measure through our City Council rely upon the assistance of leaders of working men? I have some idea of what I would do in Baltimore. I know the men whom I would approach, but they are not wage-earners. President Seth Low has said that his study and actual experience as Mayor of Brooklyn have convinced him that universal suffrage is not the cause of bad city governments. He says he did not find wealth always ready to cooperate, and he believes that our cities could not have made so rapid progress as they have without universal suffrage."

Some radical reformers, therefore, argue that we need socialistic legislation, and that immigration will help the socialist vote. But to this it may be said that even granting the premises, the conclusion does not follow. The wealth be to blame, it does not follow that all immigrants will quietly vote for reform. On the other hand, there is only too much evidence to believe that, in their ignorance, it is these very people who, being corrupted by the wealthy, enable dishonest politicians and corrupt legislators to sell legislation to the interest of monopoly and of greed. Finally, it is urged that the general principle of the brotherhood of man and the traditions of this country, as an asylum for the oppressed, should prevent any restriction upon immigration. To this it is answered that as we do not invite all the world to our family tables, we are not compelled to ruin our national life by inviting all the world to occupy our lands. The question is whether by maintaining our own high level we do not best play our part in the great brotherhood of nations. Said the late Bishop of Massachusetts: "The trusteeship of our land for all humanity—we can never go back upon that; but it may be in order for us to stand guard over the quantity, in order that we make more sure of the quality of those whom we welcome to our world."

OUR PRESENT LAWS.

The main law, which is now in force, was approved March 3, 1891. The first and chief section of this law debarb from landing "all idiots, insane persons, paupers, or persons likely to become a public charge, persons suffering from a loathsome or a dangerous contagious disease, persons who have been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude, polygamists, and also any persons whose ticket or passage is paid for with the money of another, or who is assisted by others to come, unless it is affirmatively and satisfactorily shown on special inquiry that such person does not belong to one of the foregoing excluded classes, or to the class of contract laborers. . . ." This section does not exclude persons living in the United States from sending for a relative or friend who is not of the excluded classes. In addition to these classes of persons, contract laborers are debarred under the Contract Labor Law of February 26, 1885. The new law of March 3, 1893, names no additional classes of persons to be excluded, altho the general impression is to the contrary. It simply provides for the making out of manifests at the port of embarkation, containing answers to a number of questions to be put to each intending emigrant, as to name, age, sex, occupation, etc. These manifests are to be signed or sworn to by the masters or officers of the steamers bringing the immigrants, the officers having to swear that, so far as they know, none of their passengers are of the excluded classes. These oaths are taken before the American consul at the port of departure, the object of the law being to prevent the embarkation of any persons who ought to be debarred here.

There was, however, in the winter of 1895-96, a strong agitation to place an educational

restriction on immigration. The immigration checked by the hard times of 1893-94 had increased, especially as to Italian immigration. From January 1 to May 1, 1896, 2700 Italians are said to have landed in New York City. As a result, on May 20, 1896, the House passed the so-called McCall Bill, principally prepared by the Immigration Restriction League of Boston. The principal items of the bill are (1) that "all male persons between 16 and 60 years of age who cannot both read and write the English language or some other language" shall be refused admission, provided that no parent of a person now living in this country or admitted to this country shall be excluded because of inability to read and write; and (2) that no person shall be admitted to engage in mechanical or manual labor who resides or retains his home in a foreign land, except that the Secretary of the Treasury may allow aliens to come and teach new arts and industries; (3) that no persons, company, or corporation shall employ such aliens except in the case of employees of vessels of the United States or railroad companies whose lines enter foreign countries. The bill was carried by 195 to 26.

INCIDENCES OF TAXATION. See TAXATION.

INCOME TAX.—An income tax is a direct tax levied upon income, and usually progressively graded according to the size of the income. (See TAXATION.) It seems at first sight unquestionably the most equitable of taxes, conforming as it does to almost all the canons of taxation (*q.v.*). There is, however, one great drawback. It seems almost impossible to equitably collect the tax. Honest people will report their whole income and pay the proper tax. Dishonest people (and the number of persons who will honestly report their incomes seems lamentably small) falsify their incomes and escape taxation. Some people, therefore, call it a tax upon honesty, and consider it in practical working the most unjust of taxes. John Stuart Mill says (*Political Economy*, Book V., chap. iii., § 5):

"The tax, therefore, on whatever principles of equality it may be imposed, is in practice unequal in one of the worst ways, falling heaviest on the most conscientious. The unscrupulous succeed in evading a great proportion of what they should pay; even persons of integrity in their ordinary transactions are tempted to palter with their consciences, at least to the extent of deciding in their own favor all points on which the smallest doubt or discussion could arise; while the strictly veracious may be made to pay more than the State intended, by the powers of arbitrary assessment necessarily intrusted to the commissioners as the last defense against the taxpayer's power of concealment.

"It is to be feared, therefore, that the fairness which belongs to the principle of an income tax cannot be made to attach to it in practice; and that this tax, while apparently the most just of all modes of raising a revenue, is in effect more unjust than many others which are *primâ facie* more objectionable. This consideration would lead us to concur in the opinion which, until of late, has usually prevailed—that direct taxes on income should be reserved as an extraordinary resource for great national emergencies, in

which the necessity of a large additional revenue overrules all objections."

Professor E. R. A. Seligman, on the other hand, speaking of this quarter in practice, says (*Political Science Quarterly*, vol. ix., pp. 636-638):

"It is usually forgotten that in dealing with problems of this character the real inquiry is not what is absolutely good, but what is relatively best. So far as the objection is true, it will be found to be due in great part to certain provisions of the law which, as we shall see, might have been avoided. But the objection itself has been made too much of. It is undoubtedly true that the income taxes in the commonwealths are almost entirely farcical. But that is owing solely to the fact that no earnest effort is made to execute the law. Where, however, there is a serious administration, as was the case with the federal income taxes during the Civil War, the result is very different. It is commonly assumed that the Civil War income tax was in many respects a failure and was provocative of great frauds. But after some comparison of the federal income tax with the local property taxes, I venture to say that the federal income tax, notwithstanding all its imperfections, crudities, and ensuing frauds, was nevertheless more successful than the general property tax. Let us test this by taking its fortunes in a typical State, utilizing the returns of the State comptroller and the federal officials. . . .

"In short, the history of the income tax clearly shows that it was more lucrative than a corresponding property tax, and that it succeeded in many cases where the personal property tax failed. The income tax was indeed productive of great frauds, but the personal property tax created far more. It was precisely because the income tax reached so many of the mercantile and capitalistic classes who have both previously and since escaped taxation, that it became unpopular and was abolished."

Such are typical opinions. In Europe it is a common form of taxation, and seems to have worked better the longer it has been tried.

Of the history of the income tax Professor Seligman says (in the above article):

"England led the way in the introduction of the new system. When Pitt had come almost to the end of his fiscal expedients during the desperate struggle with France, he introduced in 1798 the famous 'triple assessment.' The so-called 'assessed taxes' at that time included taxes on carriages, servants, horses, dwellings, dogs, powder, and watches. Pitt took the taxpayers who were assessed to these taxes, and multiplied their assessment by a figure ranging from three to five times the original amount. Although reference was made to income in several places, the tax was really on expenditure, or on the presumed income as calculated by expenditure. Partly for this reason and partly because it was levied only on those who had previously paid the 'assessed taxes,' it was a failure. Accordingly in 1799 the new 'property and income tax' was levied directly on income, not on expenditure, and all persons were required to make a return of their total income. In 1803 an important change took place, in that the tax was no longer assessed on the total income, but on each source of income by itself, in five schedules. With some minor changes the tax continued until the close of the Napoleonic wars, when it was dropped, not to reappear until 1842.

"At that time the contemplated abolition of the Corn Laws and the abandonment of the protective system made it necessary to seek some compensation in other directions. It was, therefore, chiefly as a revenue measure that recourse was had to the old income tax, now reenacted on about the same lines as those of 1803. But what was imposed

History.

as a mere temporary makeshift has grown to be a permanent part of the English tax system, which no one now thinks of abandoning, and which yields an annual revenue of about \$70,000,000, capable of increase or diminution according to a change in the annual rate.

"As in England, so in Italy the revenue feature was the chief consideration in the origin of the present income tax. It was adopted by Cavour, the great admirer and student of England, as a means of support

for the newly born kingdom of Italy. Initiated by the law of 1864 and greatly altered by the law of 1877, the Italian income tax now yields about \$50,000,000 a year.

"In France, again, the immense burdens of the war of 1870 led the financiers to cast about for means of relief. The sad memories of the abuses connected with personal taxation before the Revolution were still strong in the minds of the public. Although a general income tax was proposed, the law enacted in 1871, which is still in force to-day, provided for a tax only on income from corporations and associations. This partial income tax yields about 75,000,000 francs a year.

"In the United States the federal income tax was also due to fiscal considerations. During the War of 1812 Secretary Dallas had put forth a scheme of a general income tax, and if peace had not been concluded a few weeks later, there is little doubt that the proposition would have been adopted. When the Civil War broke out, the fiscal exigencies were such that no opposition to the scheme was made. The income tax sections of the Direct Property Tax Act of 1861, however, were never put in force, and it was not until 1862 that an 'income duty' was levied on all annual 'gains, profits, or income.' The tax, of which we are told in the Government reports that 'the people have accepted it with cheerfulness,' grew increasingly unpopular as the great need of revenue diminished, until the system came to an end in 1872.

"While in England, Italy, France, and the United States, the income tax was due primarily to the temporary needs of the Government, in other places like Germany, Switzerland, Australia, and some of the American commonwealths, it was adopted as a means of improving the general tax system. In the German States the real-estate tax had become by the beginning of the century a tax on the produce of land and houses. To this some of the States gradually added taxes on the product from other sources, like capital, business, and individual exertions. Other States sought to make the system more equitable by regarding the personal situation of the profits-receiver rather than the amount produced. Thus, there grew up, on the one hand, a general income tax, as in Prussia, Saxony, and Baden, and on the other hand a system of partial income taxes supplementing the original taxes on produce, as in Bavaria, Württemberg, and some of the smaller States. But everywhere the idea was to attain a greater uniformity and equality of taxation. So also in Holland, the two laws of last year have finally realized the much-mooted scheme of reform, introducing a general plan of income taxation, through a tax on income from property and a separate tax on income from all other sources.

"In the cantons of Switzerland the system of taxation was for a long time exactly the same as in the American States. But the inadequacy of the general property tax finally led them to supplement it by a taxation of incomes. In some cantons we find a general property tax and a general income tax; in others we have a property tax on certain elements and an income tax on other elements. But in the majority of cases we find a property tax together with a supplementary income tax, in order to avoid double taxation. In democratic Switzerland, as in monarchic Germany, the income tax has become so firmly entrenched that any proposition to abolish it would be regarded as a retrograde step.

"Some of the American commonwealths also have endeavored to remedy the defects of the general property tax by the imposition of an income tax. This is a chapter in the history of finance which has been almost entirely overlooked, and which can only be alluded to in this place. The still existing income tax in North Carolina was begun in 1840, because, as the preamble of the act recites, 'there are many wealthy citizens who derive very considerable revenues from

interest, dividends, and profits, and who do not contribute a due proportion to the public exigencies.' So also the income taxes of Alabama and Virginia, which were introduced in 1843 and 1849, arose out of dissatisfaction with the existing property taxes. These examples are all the more significant when it is borne in mind that the defects of the general property tax were by no means so glaring 50 years ago as they are to-day. It is true that most of these income taxes were failures for much the same reason that the tax on personal property has become a farce. In Alabama the income tax was abolished in 1884; only in Massachusetts, Virginia, and North Carolina is any attempt made to-day to levy an income tax, and in these States the attempt for many reasons meets with a very slight degree of success. But the point to be empha-

sized here is that the income tax, whenever introduced into any American commonwealth, was enacted with the avowed purpose of removing inequalities in the tax system.

"In Australasia, also, there has been of recent years a very decided movement toward income taxes for the purpose of rendering the revenue systems more equitable. An income tax has existed in South Australia since 1885, in addition to the land tax. In Tasmania an income tax-bill has recently been introduced. In New South Wales a similar bill was passed by the Assembly a year or two ago, after much discussion. It was indeed rejected by the Legislative Council, but it is bound to reappear in the near future. In New Zealand the dissatisfaction with the general property tax finally reached such a point that it was replaced in 1891 by a land tax, together with a tax on all incomes other than those from land. The income tax was collected for the first time in 1893."

As to the United States war income tax, the following are the more important details :

It was during the extra session of Congress in 1861 that Thaddeus Stevens, Chairman of the Committee of Ways and Means, reported the first Income Tax bill. As amended and passed, it taxed all incomes over \$800 3 per cent., unless derived from United States bonds, which were taxed 1½ per cent. Incomes of citizens of the United States residing abroad were taxed 7½ per cent. Owing to the late time of its taking effect, the income tax brought into the treasury but a small sum prior to the year 1864, when there was collected under the head of income tax a little over \$15,000,000. By the act of March 3, 1865, the Income Tax law was amended so as to increase the 3 per cent. tax to 5 per cent., and the 5 per cent. tax on incomes over \$10,000 was changed to a 10 per cent. tax upon the excess over \$5000 income. The most of the tax for the year 1865, however, was collected under the original law, and brought into the treasury the sum of \$21,000,000 for the fiscal year 1864-65. The following year, 1865-66, the war having ceased and the country being in a high state of development in all its resources, the income tax rose to a point the highest ever reached in the history of the tax. The returns for the fiscal year ending June 30, 1866, showed a total revenue from the income tax of \$60,547,832.43. This was but little diminished in the following year, 1866-67, when the net revenue from the income tax footed up \$57,040,640.67.

The income tax was further amended March 2, 1867, so as to increase the exemption then standing at \$600 (it having in the mean time been modified from \$800) up to \$1000. At the same time all discrimination as to taxing large incomes a higher rate was abolished, and the tax fixed at 5 per cent. on all incomes in excess of \$1000.

Under the modified tax there was collected in the year 1868 the large sum of \$32,027,640.73 ; in 1869, \$25,025,068.86, and in the fiscal year ended June 30, 1870, \$27,125,046.11. On that day the income tax ceased in the United States.

The entire amount realized from it in 10 years was nearly \$365,000,000. It reached about 250,000 persons out of a population of 40,000,000.

In recent years there has been considerable agitation for an income tax, culminating in the passage of a bill establishing such a tax, tho it was declared unconstitutional by the Supreme Court. Professor Seligman says (in the above-quoted article) :

"For some years a progressive income tax has been one of the chief planks in the platforms not only of the Populists and the anti-monopolists, but of the farmers' conventions throughout the length and breadth of the land.

"When, therefore, the opportunity presented itself, the Western and Southern representatives in Congress were not slow to seize it. The self-imposed mission of the Democratic Party was to reduce and equalize taxation. Altho the Democrats at first proposed simply to lower the tariff to a revenue basis, it was soon recognized that the reductions would be more radical. Looked at merely from the standpoint of convenience and ease of collection, the simple method of making good a deficit in the tariff revenue would have been to modify the system of internal revenue. This plan, indeed, was advanced by Mr. David A. Wells, and at one time it seemed to enjoy a reasonable prospect of meeting with legislative approval. . . .

"But while the anticipated deficit gave the Western and Southern representatives their opportunity, it was not so much the idea of increasing the revenue as that of correcting inequalities in the tax system that was really in their mind. . . . Opposition to the tax came, as was natural, from the great cities of the East. . . . The large dailies were filled with indignant protests. In the West there was by no means the same opposition even among Republicans. An Income Tax bill was introduced into the House January 24, 1894, but was subsequently incorporated in the Wilson tariff bill. It was bitterly opposed, notably by David Hill, of New York, but it finally passed with the Tariff bill by a vote of 182 to 106. It became a law without the President's signature. Its constitutionality, however, was questioned, and several test cases were pushed through to the Supreme Court, which rendered a decision April 8, 1895, declaring some of its clauses unconstitutional, but on some other points, Justice Jackson being sick, the court was evenly divided. May 20, however, a final decision was rendered by a vote of five to four, declaring the whole bill unconstitutional, in that it was a direct tax, and made no provision for an apportionment among the States according to the population, the Constitution declaring that all direct taxes must be so apportioned. Justices Brown, Jackson, Harlan, and White entered a vigorous dissenting opinion, but one of those who had previously thought the tax constitutional had changed his mind, and the tax was declared illegal. But the Democratic Party has put an income tax plank into its platform of 1896, and the end is not yet."

References : See TAXATION.

INDEPENDENT LABOR PARTY, THE (ENGLISH), popularly called the I. L. P., is mainly the outgrowth of the agitation of Mr. Keir Hardie (*q. v.*), for an independent political party to voice the demands of labor. In 1888 he established a Scotch Labor Party. (See SCOTLAND.) In January, 1893, a conference of 115 persons was held at Bradford, England, and the Independent Labor Party organized. Tho not using the term socialist in its name, it is now distinctly socialistic, its constitution, as amended in 1894, declaring its object to be "the collective ownership and control of the means of production, distribution, and exchange."

Its methods are the capture of the House of Commons by independent labor representatives. Its present social and industrial program includes an eight-hour day, abolition of overtime, provision for the aged and disabled, universal free education, work for the unemployed, taxation of unearned incomes, arbitration, and disarmament.

At the second conference, held in Manchester in 1894, 115 delegates were present, representing branches. An I. L. P. of Wales and Monmouthshire was formed in 1894. At the third annual conference (1895), held in Newcastle-on-Tyne, the political program of the party was much extended and classified under 27 items. Of the part played by the I. L. P. in the general election in 1895 Mr. Tom Mann, the secretary of the I. L. P., writes in the *Labor Annual* for 1895 :

"The defeat of the Liberal administration in the month of June, necessitating the general election in July, involved the summoning of a special I.L.P. conference to decide what should be the policy of the I.L.P. in constituencies where no socialist candidate could be run. Accordingly, a special conference was held on July 4, in Essex Hall. It was agreed that none but socialists should be supported by the I.L.P. members, and only those to be counted worthy of support who were either members of the I.L.P. or the S.D.F. In order to test the feeling of the delegates as to their attitude toward the orthodox parties in other constituencies, a vote was taken, with the following result : One delegate thought the I.L.P. as a body should

vote Liberal; 2 others, that they should vote Conservative; 7 thought it best to vote against the sitting member; and 105 that the party should entirely abstain from voting for either Liberal or Conservative. This decisive vote was sent all over the country as an instruction from the conference. . . . The loyalty of the rank and file to the special conference decision was in every way commendable. Altho not one member of the party was returned to Parliament, to have run 28 candidates, to have secured an average of 1583 votes, and a total of 44,321 for a first trial, was, without a doubt, an achievement of much hopefulness."

The prominent organs of the I. L. P. are Keir Hardie's *Labor Leader* and Robert Blatchford's *Clarion*.

INDIA AND SOCIAL REFORM.—(For the conquest of India by the British, see EAST INDIA COMPANY; for the agricultural conditions, see AGRICULTURE.)

The present form of government in India dates from 1858, when all the territories in India governed by the East India Company were vested in the crown, the executive authority being a governor-general, styled viceroy, appointed by the crown and acting under the orders of the secretary of the State for India, who is assisted by a council, the major part of whom must have served or resided 10 years in India. There is also a council of the governor-general of 6 members, appointed by the crown, and a legislative council of 22, nominated by the viceroy. There are 12 provinces, each with a governor. The governors of Madras and Bombay have also legislative and executive councils.

Statistics.

The total area of the 12 provinces of British India, not including the tributary native states, was in 1891, 964,993 square miles, with a population of 287,223,431; 85,670,000 speak Hindu, 41,340,000 speak Bengali, 238,499 speak English. The English-born population was 100,551 in 1891; 171,735,000 are supposed to be dependent on agriculture, 25,468,000 on general labor, 3600 on the State and local administration.

Two hundred and seven millions in 1891 were of the Hindu religion, 57,000,000 Mohammedans, 7,000,000 Buddhists, 9,000,000 Animistic, 2,285,380 Christians (of which 1,315,265 were Roman Catholics), 246,546,176 were illiterate and not under instruction, 3,195,220 were under instruction. The revenue of India in 1894 was 90,505,214 rix. The expenditures in 1894 were over 92,112,212 rix.

The main source of revenue was a land tax, and the main expenditure for the army. The imports in 1894-95 were 83,110,200 rupees, and the exports, 117,139,831. In 1894 there were 18,855 miles of railway open, of which 5377 were worked by the State. The working expenses are less than 50 per cent. of the gross earnings. India has to spend about £16,000,000 in England in gold, while its revenues are raised in silver. June 26, 1893, its mints were closed to the unrestricted coinage of silver.

The problems of social reform in India are those incidental to a great empire of one degree of civilization being ruled from a far-distant land of a very different civilization. On the one hand, Great Britain is accused, not without a very large basis in fact, of governing India, not for the good of India, but of Great Britain. The monetary policy, the trade restrictions, adopted by the Anglo-Indian Government is dictated undoubtedly by the interest of English gold rather than Hindu needs. Nevertheless, it can equally be shown that Great Britain's rule of India, however selfish, has been more for India's good than the centuries when India undertook to govern herself. If there have been famines and plagues under the rule of Great Britain in India, they have doubtless been lighter than they were formerly. Great Britain has scrupulously, for the most part, respected the religious views and rites of her heathen subjects, and only comparatively recently

has she even ventured to forbid the inhuman sacrifices and self-immolations taught by the Hindu faiths. She has introduced railroads and developed commerce. The problems of India to-day are how far to allow local government in communities not fitted for it, and how far to force Western ideas of democracy on civilizations molded on caste. Too often, however, a necessary paternalism has been made the excuse for the selfish tyranny of the parent government.

INDIRECT TAXATION. See TAXATION.

INDIVIDUALISM.—The term *individualism*, as used in social science, has been defined as "the theory of government which favors the non-interference of the State in the affairs of individuals" (*Century Dictionary*). It is, however, more commonly, and much more correctly used for the *tendency* to oppose State interference in the affairs of the individual rather than for any cut-and-dried theory of the function or lack of function of the State. When a man says he is an *individualist*, he usually means not that he holds any exact *à priori* theory as to what the State should or should not do, but that he inclines to oppose State interference, unless it be very clearly proven that it is necessary. **Definition.** The presumption with him is against interference. He inclines to resist socialistic legislation, even in small matters, lest they lead to a general State socialism. He believes that we must finally decide from experience and history what in each particular case is wise. Individualism must not be confounded with anarchism (*q. v.*), nor with the positive program laid down by particular individualists, however prominent. (See SINGLE TAX; SPENCER; VOLUNTARISM.)

We find individualism somewhat developed among the Greek Sophists and in all Greek thought. Greek political philosophy conceived, it is true, of the individual as living for the State rather than for himself; but with this went a high conception of the complete man, the sound mind in a sound body, and this developed a practical, ethical, if not a political individualism. Aristotle, with his tendency to exalt the concrete over Platonic abstractions, may be said to be the first great thinker of individualism, tho even he held the high Greek conception of the State. The Cyrenaic and the Epicurean schools both developed a type of ethical individualism. Still more did Stoicism lend itself consistently to individualism. Some of the profoundest thoughts of ethical individualism have come down from the Greek Stoics, while some of its noblest and most classic utterances must be sought in the pages of the Roman Stoics.

The Roman Empire, it is true, developed into a strong imperialism; nevertheless, in Roman thought, and above all in Roman jurisprudence, the individual is in a large sense supreme over the State, since we have here the first clear development of the theory of contract between free individuals. Meanwhile, the life and teachings of Christ were developing, many hold, an individualism flowering into fraternal charity rather than the primitive Christian communism,

of which so much is said to-day. (For a discussion of this, see CHRIST AND SOCIAL REFORM; CHRISTIANITY AND SOCIAL REFORM.) Be this as it may, the Middle Ages, inheriting the traditions of Roman power, together with the religious teachings of Christ, developed an ecclesiastical paternalism removed alike from a primitive communism or an ethical individualism.

Nevertheless, in some of the school men we trace an individualist thought based in part upon the teachings of Aristotle, while some of the ascetics practised what may be called a selfish individualistic spirituality. The characteristic ages of individualism, however, are those between the fifteenth and the nineteenth centuries. Revolted alike from the despotism of the Church and the tyranny of the warrior, we find the individual asserting himself everywhere, in religion and in philosophy, in political science and in practice. In religion, Luther, by the doctrine of salvation by faith, lifts the individual into the right of private judgment; while Calvin, with his doctrine of the divine decrees, by making man obedient to God alone, lifts him above obedience to any human power. From the position of Luther or Calvin it was but a step toward the practical realization of their theories by an assertion of the right of private judgment in morals and of civil liberty in matters where unity of action was not a social necessity. Kant, Bentham, John Stuart Mill, all helped people to take this step more and more fearlessly. The line of thought advanced by these men finds its legitimate development in the writings of John Morley and its exaggeration in those of W. K. Clifford.

Says Mr. Morley (*On Compromise*, pp. 278-281):

"We may best estimate the worth and the significance of the doctrine of Liberty by considering the line of thought and observation which led to it. To begin with, it is in Mr. Mill's hands something quite different from the same doctrine as preached by the French revolutionary school; indeed, one might even call it reactionary, in respect of the French theory of a hundred years back. It reposes on no principle of abstract right, but, like the rest of its author's opinions, on principles of utility and experience. . . . Mr. Carlyle and one or two rhetorical imitators poured malediction on the many-headed populace, and with rather a pitiful impatience insisted that the only hope for men lay in their finding and obeying a strong man—a king, a hero, a dictator. How he was to be found, neither the master nor his still angrier and more impatient mimics could ever tell us.

"Now Mr. Mill's doctrine laid down the main condition of finding your hero—*viz.*, that all ways should be left open to him, because no man, nor majority of men, could possibly tell by which of these ways their deliverers were from time to time destined to present themselves. Wits have caricatured all this by asking us whether by encouraging the tares to grow, you give the wheat a better chance. This is as misleading as such metaphors usually are. The doctrine of liberty rests on a faith drawn from the observation of human progress, that tho we know wheat to be serviceable and tares to be worthless, yet there are in the great seed-plot of human nature a thousand rudimentary germs, not wheat and not tares, of whose properties we have not had a fair opportunity of assuring ourselves. If you are too eager to pluck up the tares, you are very likely to pluck up with them these untried possibilities of human excellence, and you are, moreover, very likely to injure the growing wheat as well. The demonstration of this lies in the recorded experience of mankind."

Professor Hadley thus sums up this philosophy of individualism (*Economics*, p. 14):

"Constitutional liberty in politics, rational altruism in morals, and modern business methods in production and distribution of wealth have been the outcome of the great individualistic movement of the nineteenth century. The individualist has taught people not to confound public morality with a state church, public security with police activity, or public wealth with government property. He has taught men that, as society develops, the interests of its members become more and more harmonious; in other words, that rational egoism and rational altruism tend to coincide."

But the characteristic modern development of individualism is economic. With many fore-runners, and perhaps particularly Hume, Adam Smith is here the great name, the father of the school of natural liberty, which we do not dwell upon here only because it is treated in full elsewhere.

Causes.

(See POLITICAL ECONOMY.) Yet perhaps even here the school of natural liberty and Adam Smith are a result rather than a cause. It was necessary to break the old economic restraints. New discoveries, new inventions, new processes refused to be fettered by old laws. In France, the Revolution; in England, Adam Smith; in Germany, the Stein Hardenberg legislation; in America, the bills of rights incorporated into the national and State constitutions, all witness to and develop the same tendency to free and to protect the individual from restraint. In every country it has produced reaction—in France, the empire; in Germany, State and democratic socialism; in England, factory laws, and more recently municipalism; in the United States, federalism, republicanism, and protection. Through all the first half of the nineteenth century, however, individualism was in all directions dominant. Its results are well known. The individual, free from legislative restraint, seeks gain. The producer who can produce the most, the best, or the cheapest gains the market.

Out of competition to do this has sprung the modern mastery of the methods of production, division of labor, improved machinery, gigantic plants, the factory system, industry on the large scale; if it has produced the capitalist and the millionaire, it has also both lowered prices and raised wages for the million. In its search for new markets and commercial gain it has girded the world with the telegraph, continents with railroads, and whitened the sea with sails. It has developed more progress in 100 years than all the other centuries put together. If its characteristic results have been material, it has made education common. It is true that large producers and the development of colossal transportation corporations have created difficulties for the small producer, made the workman largely dependent upon the capitalist, and developed the means of production beyond the present ability to consume, causing the phenomena of the unemployed and the tramp. But it must be remembered, in the first place, that these evils are due to the very success of individualism, so that we should think twice before we attempt to cure them by destroying the system which has created this success; secondly, it is to be doubted if there are more unemployed than before, while certainly real wages, measured by prices, are materially advanced; thirdly, individualists believe that the cure lies

Results.

not in forsaking the principle which has been the very life of modern progress, but in lifting up every individual to a level of more effective competition till every man receive the means of life because every man be able to contribute something to the social need. What is needed, according to this view, is not less, but more individualism.

Modern practical individualism does not urge that at present we should do away with all industrial legislation or all interference of the State with the affairs of individuals; it believes that till men grow wiser they need some legislative checks, but it holds that in general it is wiser to let the individual act as he will and seek to overcome the ills resulting from his mistakes by educating wiser and better individuals.

THE ARGUMENT FOR INDIVIDUALISM.

The arguments for individualism may be conveniently divided into four heads: (1) The ethical argument; (2) the biological; (3) the inductive positive argument; (4) the inductive negative argument from the follies and evils of State interference. The ethical argument probably affects the common consciousness far more than any other. Professor S. N. Patten, in the Introduction to his *Theory of Social Forces*, considers individualism to rest largely on eighteenth century philosophy, and says:

"I question whether the hold which this social philosophy has on the popular mind can be shaken by an appeal to inductive evidence. This hold depends upon certain concepts and ideals which have received classical statements at the hands of our ablest thinkers, and which cannot be displaced by unorganized facts."

The basis of popular individualism undoubtedly lies deep down in the fundamental facts of the universe, in the power, the worth, the consciousness of responsibility in the individual soul. It takes ordinarily a form either religious or one of so-called natural ethics. **The Ethical Argument.** One of the fundamental principles of Christianity is the worth of the individual soul. Protestantism, with its right of private judgment, its doctrine of salvation by faith, is particularly in accord with the individualistic tendency.

Dr. Lyman Abbott, in his *Evolution of Christianity*, says:

"It has been said that Jesus Christ was the first socialist. This is certainly an inexact, if not an absolutely erroneous statement. It would be more nearly correct to say that He was the first individualist. The socialist assumes that the prolific cause of misery in the world is bad social organization. Christ assumed that the prolific cause of misery in the world is individual wrong-doing."

Says Mr. N. P. Gilman (*Socialism and the American Spirit*, pp. 324-327):

"A higher individualism is possible, and has long been actual, with at least a few of each generation of mankind. It respects every person as having something of infinite worth in him, and would begin to improve the world by elevating the single spirit, counting no advance permanent that is not based on reformed and cultivated individuals. This method fully deserves the epithet, 'Christian,' derived from 'the only soul in history who has appreciated the worth of a man.' The teaching of Jesus was profoundly individualistic in its imperative address to the private conscience. Such a spiritual doctrine does not find its

natural alliance with a mechanical socialism. This, with most of its expounders, is materialistic to the core. The Christian spirit is in full harmony with a rationalized individualism in social life. So inspired, individualism includes voluntary cooperation, the method of modern civilization; and the ideal to which it tends is fraternalism, not paternalism. The inquiry is extremely pertinent: 'Have we yet even discovered the resources of an individualism which is not synonymous with selfishness, but welcomes and fosters public spirit?' Few wise persons will answer this in the affirmative."

This higher individualism, perhaps, quite as often to-day takes the form of so-called "natural ethics."

Mr. M. D. O'Brien, in the Introduction to his *Socialism Tested by Facts*, says:

"Weak and little, low and corrupt as he is, yet Nature has endowed man with such a spirit that he can never permanently become the slave of men. This spirit is individualism, the deepest and mightiest fact in existence, which brings man closest to Nature herself, to his central silent home, and plants the root of his life in a substance that cannot perish. Through this spirit works the infinite, and while the heavens bend above, it can never break or fail. . . . This spirit of individualism, of nonconformity, of social, political, and religious heresy is the sword which Nature forges while despots sleep; and just when they dream themselves insured in an eternity of comfortable stagnation it suddenly flashes before them, scattering their plans, circumventing their cunning, and breaking all their pet idols in pieces. This spirit opens the enslaving shell of custom, throws it aside, and allows the inner life to grow. Low slavish natures hate and fear it above everything, and no means are too bad for them to use against it; but it has always managed in the long run to undo them, and it will yet live and flourish when they and all their works are lost in the slavery of the past."

"Individualism," says Draper (*Conflict between Religion and Science*, chap. ii., p. 295), "rests on the principle that a man shall be his own master."

It is in such thoughts, of the worth of the individual, either because of its individual union with God, if the theory take a religious form, or because of the conviction that simple character, self-rule, self-reliance, self-poise, is the one thing of worth in the universe, that most men base their argument for individualism. They argue that for the State to interfere with the action of the individual weakens character. It is far better, says the individualist, for men to carve their own way, to live their own lives, to learn by experience their own lessons, even if they make continual blunders, than for the State to be interfering, even if, so far as the immediate step be concerned, it interfere wisely, because the latter course will weaken the individual will and lessen individual ability. Few individualists think that any government is wise enough to interfere wisely, but even if it were, individualists would still oppose it because of its undermining influences upon character. A wise government, they would argue, may be even worse than a foolish government. A foolish government would probably call out resistance and activity. A wise paternalism might lull to eternal sleep the power of self-choice and self-will.

The second argument for individualism is a biological one. (For a completer statement of it, see BIOLOGY; EVOLUTION.) We shall also notice it again in considering the objection to socialism. It may be said, in a word, to be that there can be no progress save by competition, no progress save by natural selection and the survival of the fittest, so that the struggle for life

between individuals is of the very essence of progressive life, while just so far as the State interferes with this struggle between individuals, and either forces or leads all men into cooperation, it must induce a low and lowering social level and the gradual degeneration of the individual. This is one of the arguments for individualism most prevalent to-day. We do not dwell upon it here simply because it is considered elsewhere. (See BIOLOGY; EVOLUTION.)

The third argument, or the induction from positive experiences of individualism, may be deemed but a form of the biological argument. It is, however, such an important form as to make it worthy of treatment by itself. It argues that the highest civilization, materially and in character, has as a matter of fact been developed when there has been the most individualism. We have seen something of this in considering the history of individualism.

Beginning largely with Adam Smith and the so-called school of national liberty (see POLITICAL ECONOMY), we have had less interference of the State with the individual than ever before in the history of civilized man. What has been the result? There have been evils; no man claims perfection for the nineteenth century; but there has been more progress in most directions than in all the other centuries of civilization put together. In science, in the means of livelihood, in popular education, in the art of preserving life, in acquainting men with the facts of the universe, in the means of communication, man has advanced as never before in all his history. Generally speaking, perhaps, the country where individualism has been carried to the farthest degree is the United States, with Great Britain next. With what result? These two countries are to-day the wealthiest, the strongest, the most vital countries of the world. The language and the commerce of these two nations are dominating the world. Particularly has the United States stood for individualism.

Says Mr. N. P. Gilman (*Socialism and the American Spirit*, p. 90):

"In more senses than one America may be called the paradise of the individual. No other country has held out such great prizes to private talent for the last century, or offered it a freer field to work in. A manly, capable, and self-reliant people, Americans have had an opportunity the like of which is unknown to history. Least of all peoples have they had reason to put their faith in governmental machinery, even that of their own devising, in preference to individual initiative and voluntary cooperation. Especially in the building up of great manufacturing industries and the development of immense transportation systems has the practical genius of the people asserted itself, with the results in the gigantic operations and colossal fortunes which we see to-day in all directions. The American is always ready to receive help from the State in starting a railway or a steamship line (the old flag and an appropriation), but he is not at all inclined to consider the Government a proper agent for the management or ownership of either."

Mr. Gilman quotes Alfred Fouillée as saying (*Education from a National Standpoint*, Am. ed., p. 6): "Scarcely an American can be found who has not in his mind, in a more or less nebulous form, this idea of illimitable individualism and indefinite expansion."

Now, what has been the result? America's material wealth, her popular education, and her progress in almost all ways, are the marvel of the world. Nowhere do the common people begin to be so well off. In wages, in home comforts, in liberty, in popular education, the working people native to the United States are far ahead of any working classes of the world, unless it be in New Zealand and in Australia. Particularly has business in America been free from governmental restrictions, with the result that nowhere else does business begin to be carried on in so effective or colossal a way, and nowhere else are the masses of the people so well off. This last thought leads to the reflection that the very fact of the prosperity of the people is the cause of the present social unrest.

Says Herbert Spencer, in the Introduction to *A Plea for Liberty*:

"Of the many ways in which common-sense inferences about social affairs are flatly contradicted by events, . . . one of the most curious is the way in which the more things improve, the louder become the exclamations about their badness. In the days when the people were without any political power, their subjection was rarely complained of; but after free institutions had so far advanced in England that our political arrangements were envied by continental peoples, the denunciations of aristocratic rule grew gradually stronger, until there came a great widening of the franchise, soon followed by complaints that things were going wrong for want of still further widening. . . . A century ago, when scarcely a man could be found who was not occasionally intoxicated, and when inability to take one or two bottles of wine brought contempt, no agitation arose against the vice of drunkenness; but now that, in the course of 50 years, the voluntary efforts of temperance societies, joined with more general causes, have produced comparative sobriety, there are vociferous demands for laws to prevent the ruinous effects of the liquor traffic. . . . And so it is too with the general state of the population in respect of food, clothing, shelter, and the appliances of life. Leaving out of the comparison early barbaric states, there has been a conspicuous progress from the time when most rustics lived on barley bread, rye bread, and oatmeal, down to our own time when the consumption of white wheaten bread is universal; from the days when coarse jackets, reaching to the knees, left the legs bare, down to the present day, when laboring people, like their employers, have the whole body covered by two or more layers of clothing; from the old era of single-roomed huts without chimneys, or from the fifteenth century, when even an ordinary gentleman's house was commonly without wainscot or plaster on its walls, down to the present century, when every cottage has more rooms than one, and the houses of artisans usually have several, while all have fireplaces, chimneys and glazed windows, accompanied mostly by paper hangings and painted doors, there has been, I say, a conspicuous progress in the condition of the people. And this progress has been still more marked within our own time. Any one who can look back 60 years, when the amount of pauperism was far greater than now, and beggars abundant, is struck by the comparative size and finish of the new houses of operatives; by the better dress of workmen, who wear broadcloth on Sundays, and that of servant girls, who vie with their mistresses; by the higher standard of living, which leads to a great demand for the best qualities of food by working people. . . . Not that the evils to be remedied are small. Let no one suppose that, by emphasizing the above paradox, I wish to make light of the sufferings which most men have to bear. The fates of the great majority have ever been, and doubtless still are, so sad that it is painful to think of them. Unquestionably the existing type of social organization is one which none who care for their kind can contemplate with satisfaction, and unquestionably men's activities accompanying this type are far from being admirable. . . . But it is not a question of absolute evils; it is a question of relative evils—whether the evils at present suffered are or are not less than the evils which would be suffered under another system; whether efforts for miti-

**Progress
under Individualism.**

gation along the lines thus followed are not more likely to succeed than efforts along different lines. . . . The present social state is transitional, as past social states have been transitional. There will, I hope and believe, come a future social state, differing as much from the present as the present differs from the past, with its mailed barons and defenseless serfs. . . . My opposition to socialism results from the belief that it would stop the progress to such a higher state, and bring back a lower state. Nothing but the slow modification of human nature by the discipline of social life can produce permanently advantageous changes."

An even stronger argument for individualism is drawn from the follies and miscarriages of the wisest and best-intentioned State legislation and control. As is well known, Herbert Spencer calls the notion that evils can be readily righted by legislation the great modern political superstition. He says: "The great political superstition of the past was the divine right of kings. The great political superstition of the present is the divine right of parliaments" (*Essay on the Great Political Superstition*). He is never weary of illustrating the sins of legislators. He argues that legislators never know where the effect of their legislation will end. He says (*The Coming Slavery*):

The Follies of Legislation. "The legislator contemplates intently the things his act will achieve, but thinks little of the remoter issues of the movement his act sets up, and still less its collateral issues. . . . When, in war-time, 'food for powder' was to be provided by encouraging population—when Mr. Pitt said, 'Let us make relief in cases where there are a number of children a matter of right and honor, instead of a ground for opprobrium and contempt,' it was not expected that the poor-rates would be quadrupled in 50 years, that women with many bastards would be preferred as wives to modest women, because of their incomes from the parish, and that hosts of ratepayers would be pulled down into the ranks of pauperism. . . . Even less, as I say, does the politician who plumes himself on the practicalness of his aims conceive the indirect results which will follow the direct results of his measures. Thus, to take a case connected with one named above, it was not intended, through the system of 'payment by results,' to do anything more than give teachers an efficient stimulus; it was not supposed that in numerous cases, their health would give way under the stimulus; it was not expected that they would be led to adopt a cramming system and to put undue pressure on dull and weak children, often to their great injury; it was not foreseen that in many cases a bodily enfeeblement would be caused which no amount of grammar and geography can compensate for. The licensing of public-houses was simply for maintaining public order; those who devised it never imagined that there would result an organized interest powerfully influencing elections in an unwholesome way. Nor did it occur to the 'practical' politicians who provided a compulsory load-line for merchant vessels, that the pressure of ship-owners' interests would habitually cause the putting of the load-line at the very highest limit, and that from precedent to precedent, tending ever in the same direction, the load-line would gradually rise in the better class of ships, as from good authority I learn that it has already done. Legislators who, some 40 years ago, by act of Parliament compelled railway companies to supply cheap locomotion, would have ridiculed the belief, had it been expressed, that eventually their act would punish the companies which improved the supply; and yet this was the result to companies which began to carry third-class passengers by fast trains; since a penalty to the amount of the passenger duty was inflicted on them for every third-class passenger so carried. . . . 'We must educate our masters,' is the well-known saying of a Liberal who opposed the last extension of the franchise. Yes, if the education were worthy to be so called, and were relevant to the political enlightenment needed, much might be hoped from it. But knowing rules of syntax, being able to add up correctly, having geographical information, and a memory stocked with the dates of kings' accessions and generals' victories, no more implies fitness to form political conclusions than acquire-

ment of skill in drawing implies expertness in telegraphing, or than ability to play cricket implies proficiency on the violin. 'Surely,' rejoins some one, 'facility in reading opens the way to political knowledge.' Doubtless; but will the way be followed? Table-talk proves that nine out of ten people read what amuses them or interests them rather than what instructs them; and that the last thing they read is something which tells them disagreeable truths or dispels groundless hopes. That popular education results in an extensive reading of publications which foster pleasant illusions rather than of those which insist on hard realities is beyond question."

In other writings, Mr. Spencer gives still more detailed instances of the ways in which State legislation works unexpected ills. He says (*Social Statics*, ed. of 1851, p. 384):

"An architect and surveyor describes it [the Building Act] as having worked after the following manner. In those districts of London consisting of inferior houses built in that unsubstantial fashion which the New Building Act was to mend, there obtains an average rent, sufficiently remunerative to landlords whose houses were run up economically before the New Building Act passed. This existing average rent fixes the rent that must be charged in these districts for new houses of the same accommodation—that is the same number of rooms, for the people they are built for do not appreciate the extra safety of living within walls strengthened with hoop-iron bond. Now it turns out upon trial, that houses built in accordance with the present regulations, and let at this established rate, bring in nothing like a reasonable return. Builders have consequently confined themselves to erecting houses in better districts (where the possibility of a profitable competition with preexisting houses shows that those preexisting houses were tolerably substantial), and have ceased to erect dwellings for the masses, except in the suburbs where no pressing sanitary evils exist. Meanwhile, in the inferior districts above described, has resulted an increase of overcrowding—half-a-dozen families in a house, a score of lodgers to a room. Nay, more than this has resulted. That state of miserable dilapidation into which these abodes of the poor are allowed to fall is due to the absence of competition from new houses. Landlords do not find their tenants tempted away by the offer of better accommodation. Repairs, being unnecessary for securing the largest amount of profit, are not made. . . . In fact, for a large percentage of the very horrors which our sanitary agitators are trying to cure by law, we have to thank previous agitators of the same school!"

Later, in *The Sins of Legislators*, Mr. Spencer says of the building laws:

"See then what legislation has done. By ill-imposed taxes, raising the prices of bricks and timber, it added to the costs of houses and prompted, for economy's sake, the use of bad materials in scanty quantities. To check the consequent production of wretched dwellings, it established regulations which, in medieval fashion, dictated the quality of the commodity produced; there being no perception that by insisting on a higher quality and therefore higher price, it would limit the demand and eventually diminish the supply. By additional local burdens, legislation has of late still further hindered the building of small houses. Finally, having, by successive measures, produced first bad houses and then a deficiency of better ones, it has at length provided for the artificially increased overflow of poor people by diminishing the house capacity which already could not contain them!

"Where then lies the blame for the miseries of the East End? Against whom should be raised 'the bitter cry of outcast London'?" . . .

"So, too, with State supervision. Guaranteeing of quality by inspection has been shown, in the hall-marking of silver, to be superfluous, while the silver trade has been decreased by it; and in other cases it has lowered the quality by establishing a standard which it is useless to exceed: instance the case of the Cork butter-market, where the higher kinds are disadvantaged in not adequately profiting by their better repute; or instance the case of herring-branding (now optional), the effect of which is to put the many inferior curers, who just reach the level of official approval, on a par with the few better ones who rise above it, and so to discourage these. But such lessons pass unlearned. Even where the failure of inspection is most

glaring, no notice is taken of it; as instance the terrible catastrophe by which a train full of people was destroyed along with the Tay bridge. Countless denunciations, loud and unsparring, were vented against engineer and contractor; but little, if anything, was said about the Government officer from whom the bridge received State approval. So, too, with prevention of disease. It matters not that under the management or dictation of State agents some of the worst evils occur; as when the lives of 87 wives and children of soldiers are sacrificed in the ship 'Accrington'; or as when typhoid fever and diphtheria are diffused by a State-ordered drainage system, as in Edinburgh; or as when officially enforced sanitary appliances, ever getting out of order, increase the evils they were to decrease."

These instances of the failure of legislature, quoted by Spencer, are now somewhat classical and out of date, but they can be easily replaced by modern ones. Mr. Charles Fairfield, in his chapter on "State Socialism in the Antipodes" contained in *A Plea for Liberty*, instances many failures of legislation in Australia, supposed to be in the vanguard of socialistic progress. He shows how the early-closing law in Melbourne in 1885, whereby shops could not keep open after seven P.M., proved utterly impracticable, robbing all the small suburban stores, which did their main business in the evening, of all chance of success and creating such an opposition that the law was repealed in a few days. He argues that the conduct of the Australian State railroads has been at a heavy loss, only concealed by government book-keeping. In England herself instances of the failure of State operations can be multiplied almost indefinitely.

Says Mr. L. J. Jennings, M.P. (*Fortnightly Review*, August, 1888, p. 185):

"Look, for instance, at the Admiralty and the War Office. These two departments alone cost the country £563,324 a year. The waste of labor that goes on daily is incredible. At the Admiralty the officials, sitting under the same roof, write long letters to one another on the most trivial subjects, just as if they were 500 miles apart. An immense heap of correspondence may be accumulated about a stick of sealing-wax or a bit of string. The Accountant-General's Department, crammed with extravagantly paid officials, involves charges for the working staff of £63,557 a year, and a pension list of £32,324. . . . The Secretary of the Admiralty, Mr. Porwood, has admitted (First Report of Sir Matthew White Ridley's Commission, Q. 9751) that if the salaries were placed on a 'commercial basis' the expense of the Accountant-General's Office would be brought down to £35,000 or £40,000 a year. Why is it not placed on a commercial basis? It cannot be because the authorities have not had a free hand in the 'game of reorganization.' There have been at least five heroic operations of this kind since 1869, at tremendous cost to the country. . . . What sort of commentary is it on the great reorganization of 1878-80, which cost the country £20,000 a year in pensions and £52,199 in bonuses, that the Department is now found to be filled, as the heads of it allege, with extravagantly paid or incompetent officials. . . . The War Office clerk goes leisurely to his duties at 10 or 11, and remains till four or five, his prescribed hours being six each day. And what is the nature of his work? A good deal of it is utterly thrown away. Accounts are audited and reaudited in a purely arbitrary and farcical manner. . . . Correspondence rolls on in huge volumes about trifles light as air; a charge for the use of a cab, a bill of 2s. 6d. for candles, a rent in a soldier's jacket, the loss of a nosebag (actual instances of these cases will be found in the evidence taken before the Army Estimates Committee, 1887 and 1888) may form the theme of an almost interminable number of letters. The cut in the soldier's jacket was 'inquired into' by colonels, lieutenant-colonels, deputy adjutant-general, assistant deputies, and all sorts of high officials. The documents were entered into books, signed, stamped, and passed on from one to the other for nearly four weeks."

In the United States illustrations of the cost-

liness and inefficiency of State operations are notorious. All municipal operations are full of jobs. The building of the County Court House in New York City is only an extreme instance of what goes on in all government undertakings. When designed in 1868 its cost was estimated at \$250,000. Before the end of 1871 it had cost a sum variously estimated at from \$8,000,000 to \$13,000,000, and it was still far from finished. Among the items of the cost for fitting it up were \$404,347 for safes and \$7500 for thermometers. It is from such facts as these of the repeated failures of government activities to-day that individualists drew their negative argument against socialism. From such instances they very naturally draw the inference that if government cannot efficiently conduct the comparatively small activities it now attempts, it must still further fail in the almost infinitely more difficult functions that would be given to it under a complete socialistic régime. They further argue that even if government, surrounded and supported by individualistic methods, and with wealth created by individualism for it to tax, can, perhaps, altho clumsily and expensively, carry on the few activities of which socialists make so much to-day, were the government to attempt all, it would be quite another thing. Yet if the State cannot do all, the accustoming of people to depend upon the State weakens the power of individuals and teaches them to lean on a reed that finally will break. To argue that government ever can conduct the complete industrial life of the people is to almost all economists and to absolutely all individualists the height of absurdity.

Mr. E. S. Robertson, in his essay on "The Impracticability of Socialism" (chap. i. in *A Plea for Liberty*), argues that, passing by the facts that socialists very rarely go into practical details; that it is scarcely possible to see how socialism could provide the clothing for a community except by putting it into a strict uniform as in an army, since, if fashion were allowed, no national committee could foretell what would be needed—passing by the enormous problem of how to manage domestic labor under socialism, except by destroying the home, saying nothing of the still greater difficulties of just distribution between labor of different degrees of value and laborers of different degrees of ability—passing by all these and a hundred other similar difficulties, socialism utterly breaks down before the population question. He says: "The situation may be summed up in a sentence: Socialism without restraints on the increase of population would be utterly inefficient. With such restraints it would be slavery. In a word, socialism—the scheme of collective capital and collective production and distribution—breaks down the moment it is subjected to any practical test." How would the community decide, he asks, of the children born in any year—how many boys should be tailors and how many girls dress-makers? "Socialism, disguise it as we may, is the negation of freedom." Similarly argue all individualists.

The
United
States.

The Impos-
sibility of
Socialism.

But probably the chief arguments raised to-day to show the impracticability of socialism and the necessity of individualism, are, as above stated, biologic. Mr. Kidd argues in his *Social Evolution*, p. 209, that socialism has not and probably cannot make any serious attempt to deal with even the initial difficulties of the continued success of a society where the struggle for existence is eliminated. He says: "Underneath all socialist ideals yawns the problem of population."

Mr. Herbert Spencer, in his latest work, says: "People who in their corporate capacity abolish the natural relation between merits and benefits will presently be abolished themselves. Either they will have to go through the miseries of slow decay consequent on the increase of those unfit for the business of life, or they will be overrun by some people who have not pursued the foolish policy of fostering the worst at the expense of the better." Mr. Lecky says (*Democracy and Liberty*, chap. viii.): "The socialist remedies would only bring evils far greater than any they could possibly prevent. The desire of each man to improve his circumstances, to reap the full reward of superior talent, or energy, or thrift, is the very mainspring of the production of the world. Take these motives away; persuade men that by superior work they will obtain no superior reward; cut off all the hopes that stimulate among ordinary men ambition, enterprise, invention, and self-sacrifice, and the whole level of production will rapidly and inevitably sink. . . . the essential difference of men in aptitudes, capacities and character, are things that can never be changed, and all schemes and policies that ignore them are doomed to ultimate failure." Says Mr. Kidd (*Social Evolution*):

Degeneration under Socialism.

"It will not help us, even if there are to be no competing societies, and if in the contemplated era of socialism the whole human family, without distinction of race or color, is to be included in a federation within which the competitive forces are to be suspended. We may draw such a draft on our imagination, but our common sense, which has to deal with materials as they exist, refuses to honor it. We are concerned not with an imaginary being, but with man as he exists, a creature standing with countless sons of this competition behind him, every quality of his mind and body . . . the product of this rivalry, with its meaning and allotted place therein, and capable of finding its fullest and fittest employment only in its natural conditions."

Individualism, then, bases its argument on the fact that government can scarcely efficiently conduct even now the comparatively limited functions that it does attempt, and would utterly break down before the attempt to control the complete complex interests of all social life; that individualism, on the other hand, so far as tried during this century, while not by any means doing away with all evils, has produced more material and educational progress than in all the other centuries put together, and especially in those countries and in that country where individualism has been tried the most; that even if socialism were practicable, it would inevitably lead to the biological degeneration of the individual and of the race and finally that even the beginnings of socialism tend to undermine that self-reliance, self-rule, free self sacri-

fic, which, the men consider it born of individual communion with God or of natural ethics alone, all men are agreed to be the noblest and the only enduring and eternal quality of man. Individualism may not produce all progress in a day; individualists are not blind to the evils of the present, but they do know that an infinite progress has been made; that that progress is now going on; that it has been and is now almost solely due to individual struggle and competition in life, and that therefore it is but simple duty to resist even the beginnings of a socialism which for an impossible mirage threatens to attack all progress and to undermine man's noblest possession, individual character and individual aspiration. It is better to let a man struggle and work his own way even slowly toward character than to lift him, were it possible, into an Utopia of physical comfort, at the cost of weakened will and increased tendency to rely on a paternal or even a fraternal organization.

THE INDIVIDUALIST PROGRAM.

As asserted above, individualists are neither doctrinaires nor visionaries. Says Mr. Wordsworth Donisthorpe in "The Limits of Liberty," a chapter in *A Plea for Liberty*:

"It is not fair to assert or even to insinuate that individualism as a practical working doctrine in this country [England] and in the United States is based on reasoning from abstractions. . . . No one with the smallest claim to attention has been known to affirm that this or any other nation is yet ripe for the abolition of the State. . . . I suppose no one acquainted with his political writings will accuse Victor Yarros of backwardness or even of opportunism. Yet says he, 'The abolition of the external State must be preceded by the decay of the nations which breathe life and vigor into that clumsy monster; in other words, it is only when the people learn to value liberty and to understand the truths of the anarchistic philosophy that the question of practically abolishing the State looms up and acquires significance.'"

Mr. N. P. Gilman says of American individualists (*Socialism and the American Spirit*):

"The practical effort of those who here accept the name of individualist is to maintain the actual status against the strong tendency toward socialism which characterizes the time. If this can be successfully resisted, they trust to gradual enlightenment to weaken gradually the power of the State. The anarchist ideal, into which extreme individualism blends, is not to be reached by crying and striving. The individualist trusts in natural and in the unforced evolution of society; he exerts himself with more or less energy simply to resist efforts contrary to this law which tend to produce an artificial development. . . . The present tendency toward socialism he would explain as a reaction toward primitive ideas which have long since, for the wiser minority, been fully exploded by experience. He stands stubbornly on the defensive against this tendency, feeling sure that, unchecked, it can only result in great evil."

Contrasting individualism with Schaffle's definition of socialism (*g. v.*), Mr. Gilman says concerning individualism in its practical application:

"Economic individualism would then be the system of production by means of private capital (held by single persons, firms, corporations, or cooperative associations); this method of production demands a free labor contract, open competition, and distribution to individuals. The alpha and omega of individualism is, accordingly, private and competing capitals, with a large measure of individual freedom from State control (p. 11). . . . If we attend chiefly to the facts of the existing situation in the United States, we should then

consider individualism and socialism as two opposite tendencies, moved by either of which an American citizen may advocate or attack a definite and particular measure of legislation. The Utopia of the individualist, if Mr Herbert Spencer may speak for him, is an approach to anarchy; the Utopia of the socialist: melts into communism, but neither scheme is proposed for immediate adoption here by sensible advocates. . . . The individualist . . . in all his degrees tends to unfavorable criticism, not to high admiration, of the manner and the results of governmental activity at present. He concedes that a nation may well tolerate a certain degree of inefficiency on the part of its officials in executing their present tasks, this being, on the whole, more endurable than the evils which would result from putting the same duties upon private persons. He opposes, however, any considerable further extension of the sphere of the State, and looks to education of the individual mind and conscience and to general progress for relief from existing evils. The extreme individualist would not only resist the tendency to socialism, but would also retrace some steps already taken in that direction, as he would say, such as universal free education. There are very few, to be sure, in America who hold the creed with such vigor."

So conceiving of practical individualism, it is evident that there can be no fixed universal individualist program. It must be different in different countries; it is differently conceived by different individuals. On all important points the general individualist propositions will be found in this cyclopedia under each respective subject. (See LAND; INTEREST; WAGES; COMPETITION; EDUCATION; RAILROADS; POST-OFFICE; BANKING; MUTUAL BANKING, etc.)

We give here one illustration of how individualists would work out social problems. Of perhaps the most serious problem in modern life Mr. N. P. Gilman says (*Socialism and the American Spirit*):

"No evil in our cities appeals more forcibly to the kind-hearted than the crowded tenement houses. . . . Every one who has a particle of philanthropy in him cries out that these evils should be made to cease from off the earth. The end is clear, but what means shall we use? The socialist will dilate upon what Glasgow and Liverpool have done, and urge that Boston and New York at once purchase whole squares, pull down the noisome houses of to-day, and erect instead, clean and convenient tenements, to be let at low rates. This, however, would be too much like journeying from Chicago to Minneapolis, via Paris, the Suez Canal, and Japan. The Chicagoan would thus reach Minneapolis in time, indeed, but money and patience held out. But a more direct way would be first to discover what persons are responsible as owners or lessors of these foul habitations, and then to bring home to them as individuals the distress and the crime which they occasion, while drawing profit from such inhuman conditions. Many of these persons sin as much through ignorance as through hardness of heart. . . .

But if this should be of no effect, the men and women who are taught by the higher individualism that we are our brothers' keepers to a great degree can then follow the example of Mrs. Lincoln in Boston. Let them singly or in small associations buy or lease one or more city houses in the poorer districts and care for them in person or through kindly and capable agents. A large part of the tenement-house problem is manageable under this simple plan. . . . Where this plan is not expedient, the Peabody trustees in London, the Improved Dwelling-House Associations in Boston and New York, and such individuals as Mr. A. T. White in Brooklyn have demonstrated the eminent success of a more difficult method. Mr. J. A. Riis, a good authority, believes thoroughly in the compatibility of 'philanthropy and 5 per cent.'—the one as beginning, the other as the result. . . . The tenement-house problem in our American cities is thus fully within the control of a comparatively few persons. . . . Very few of the rich or the moderately rich in the United States would need to be converted to a higher individualism than they now practise to make the tenement-house problem a thing of the past so far as money can do it."

Such is, we believe, a fair example of the in-

dividualist program. For the far more radical proposals of such extreme individualists as the philosophical anarchists—the Spencers, the single-tax men, the voluntarians—we refer the reader to the respective articles which treat of them. Most individualists like Professor Huxley condemn alike the dogmatism of Herbert Spencer and the theories of the socialists. They hold, with Professor Jevons, that in social reform "the first step is to throw aside all supposed absolute rights or inflexible principles;" they would not, at present at least, destroy the State; what is shown by experience that the State can do better than the individual, that they would have the State do; but they hold that, fundamentally and eternally, all experience teaches that primary reliance must be put on industrial action; that what limits individual initiation limits freedom; that what weakens individual responsibility weakens character, and that therefore, in the words of President E. B. Andrews, of Brown University: "In all economic activity the presumption is in favor of individual liberty and free competition."

Revised by A. T. HADLEY.

INDUSTRIAL EDUCATION.—We include under this general heading three subjects which are distinct, altho continually confounded in the public mind—trade education, technical education, and manual training. We consider them under one head, in order that, by placing the subjects side by side, the important differences between them may be clearly brought out.

We commence with definitions. Trade education is the preparing of craftsmen for practical work in a particular trade. Technical education is the teaching of the sciences in their practical application to the material interests of man. A good trade school may be a very poor technical school, while a good technical school is not of necessity a good trade school. Manual training is different from either; it is instruction in the use of tools as a part of a complete educational discipline. Trade schools seek to turn out craftsmen; technical schools seek to turn out scientific specialists and professional men, such as civil engineers, architects, etc.; manual training seeks to develop complete manhood and womanhood by developing dexterity of hand as well as head. We must consider the three in their modern chronological development.

I. TECHNICAL SCHOOLS.

Science is modern; scientific schools are therefore modern. When Count Rumford, in 1799,

founded the Royal Institution in London, he aimed at making it a technical school. It originally contained a workshop for blacksmiths and models of machinery of all kinds; but it was fortunately diverted into a laboratory of research, developed by Davy.

Europe.

Thomas Young, Faraday, Tyndall, Rayleigh. The first really technical school seems to have been the famous school of mines at Freiburg, created by the demands of the region. The *École Polytechnique* was established in France in 1794, primarily to train men for the engineer and artillery corps of the French Army. The Imperial Technical School at Moscow and the Institute of Technology at St. Petersburg early took high rank. England, always holding a prominent place in science, was backward in developing technical schools.

Germany and Switzerland have led in technical schools. Scientific high schools sprang up for the training of men who might compete with English engineers trained in the workshop. The universities of 50 years ago did not meet the case, and consequently each State did its best to create technical institutions that would do so. Magnificent polytechnics arose like the Federal Polytechnic School at Zurich, the Polytechnic Schools at Munich, Vienna, Stuttgart, Dresden, Hanover, Aachen, the Technical High School of Berlin, now the Charlottenburg Polytechnic, the Polytechnic Schools of Delft and at Moscow.

These schools cost \$15,000,000 for building and fittings, and their maintenance costs \$1,000,000 annually.

The Zurich Polytechnic was established by the Swiss Confederation in 1854. It is one of the finest in the world, and comprises seven special schools: 1. Architecture, with a three years' course. 2. Civil engineering, three and a half years' course. 3. Mechanical engineering, three years' course. 4. Chemical technology, including pharmacy, three years' course. 5. Agriculture and forestry, two and a half years' course. 6. Normal school for training special science teachers. 7. Philosophical and political science.

Further, a preliminary course is provided in mathematics for those not yet prepared to enter one of these schools. There are 200 courses of lectures, 45 professors, and 13 assistant professors, besides tutors, curators, etc. The institution spends over \$100,000 a year. A few years ago the Federal Council voted to it \$250,000 for the extension of the chemical laboratories. The cost to a student is \$20 the half year and \$10 for laboratory practice, or about \$60 per annum in the chemical department for the full use of these great opportunities.

In the United States, the Rensselaer Polytechnic Institute at Troy, N. Y., was established in 1824 to teach civil engineers, who till then had to go to France to study. The growth of science led to the establishment of the Sheffield Scientific School of Yale University in 1847, the Lawrence Scientific School of Harvard in 1848, and the Chandler Scientific School of Dartmouth in 1852. In 1862 Congress voted land grants to

The
United
States.

the several States to enable them to build institutions for teaching agriculture and mechanics. Most of the State universities established scientific schools. Cornell became prominent for its scientific teaching. Washington University, at St. Louis, organized its School of Engineering, and Columbia College its School of Mines. The Massachusetts Institute of Technology was chartered in 1861 and opened in 1865. The Worcester (Mass.) Polytechnic Institute was opened in 1867; the Stevens Institute followed in 1871; the Rose Polytechnic Institute, in Terre Haute, Ind., in 1883; the Case School of Applied Science, at Cleveland, in 1891. In most of these schools there is a four-years' course. Modern languages are usually required for admission in place of Greek and Latin. Language, history, political economy are usually taught, besides the higher mathematics and the various sciences.

II. TRADE SCHOOLS

came after technical schools. They are modern attempts to develop craftsmen in place of the apprentice system, now all but gone. (See APPRENTICESHIP.) Here again Germany and Switzerland lead.

There are schools of a lower type called "real" and "trade" schools. The course in some is nine years, and these are called "upper real schools;" in others six or seven years, and these are called "burgher" schools.

Prussia has building schools in Berlin, Nienburg, Eikernförde, Breslau, Höxtar, and Idstein. There is a school for machine construction at Eimbeck; four weaving schools at Crefeld, Mulheim, and Eimbeck; a trade school for pottery at Höhr; trade metal schools at Iserlohn and Remscheid. There are trade continuation schools for apprentices and artisans under 18, who can be compelled to attend, as their masters are to grant them time to do so. In that case the State pays half the cost. Agricultural schools, etc., are also in operation.

Apprenticeship schools in Germany train workmen in pure and applied art and in practical work in the shop. They have spread over Southern Germany and Austria and all parts of Prussia. The manufacturers demanded better workers. Three years is the course, in which the pupils are trained as designers, modelers, wood-carvers, molders, founders, turners and pressers, chasers, engravers, gilders, and etchers. The number of artisans attending the schools is increasing.

Chemnitz, Saxony, has a technical school for chemists, a foremen's school, a building school, a drawing school, and a weaving school. A technical knowledge of dyeing is required for the exquisite work here produced.

The metallurgical school of Bochum, Westphalia, is open only to workmen employed four years in iron or engineering.

The Crefeld weaving school teaches drawing and the loom; painting from models, natural plants, and flowers for printing and other branches; machine drawing; fabrics decomposed; original design; unmounting and rebuilding power-looms, and forge work. It has a museum of textile fabrics, and the Krauth

The
Continent.

collection of historical patterns. The dyeing and finishing departments of the school are complete.

The industrial art schools of Germany apply art to manufactures more than those of France. The Dresden school has revived old and established new industries. It has departments of designing, architecture, decorative painting, ornament, figure drawing, art modeling, decorative painting from the figure. It has 16,000 mounted patterns, 11,000 examples of embroidery and lace, and a school museum containing 140,000 patterns of textile fabrics of all kinds and ages.

The industrial art school of Vienna practises carving, metal-chasing, and working in brass and bronze.

The Royal School of Art Embroidery, Vienna, is wholly technical. Girls from the primary schools are carried forward to every kind of fancy needlework and designing. There are no fees save for foreigners.

Switzerland, for the size of the country, outdoes Germany and leads the world in trade schools. She has the Technikum, at Winterthur; the general industrial school at Basel, 7 schools for industrial arts and drawing, 31 industrial drawing schools, 57 schools for professional improvement and working men's schools, 2 weaving schools, 7 watch-making schools, 8 workshops for apprentices, 2 wood-carving schools, 5 female industrial schools, 13 industrial museums, collections, etc.

Cheese and butter-making are taught at a dairy station at Perolles (Fribourg), the dairy school de la Rutti (Berne), and at a dairy school at Sorntal (St. Gall).

France has many trade schools.

The Polytechnic Association was founded in 1830 by the graduates of the Polytechnic School for the purpose of conducting preparatory courses of industrial and technical training for both sexes. Training is given in the cutting and fitting of garments, decorative painting, making of artificial flowers, and commercial courses to young girls. The municipality of Paris has been to the forefront in supplying technical education for girls. It has undertaken to fit every girl for domestic or business life who applies at its schools, and without cost to the pupil. Its *écoles professionnelles ménagères* number six, besides its "commercial school." On these schools alone £30,000 is spent annually. Other special schools in France are: the School of Telegraphy, for Government employees; schools of manual apprenticeship; higher schools of commercial studies; the National School of the Industrial Arts at Roubaix, for practical and theoretical study of the manufacture of cloth; the *École des Beaux-Arts* at Paris; the *Académie de France* at Rome; the *École des Beaux-Arts* at Lyons; the *École Nationale des Arts Decoratifs* at Paris; the National Professional School at Vierzon; the *École Professionnelle Municipale* of Rheims, to instruct youth in manufactures and commerce; the Polytechnic School at Paris; the High School of Mines at Paris; the National School of Design for Young Women at Paris; the Limoges School of Decorative Art; schools attached to the national factories of Gobelins, Sèvres, and Beauvais; a

school of fine arts at Toulouse; a school of master workmen of mines at Calais; a school of horticulture at Versailles; the Central School of Arts and Manufactures in Paris.

There are also schools of arts and manufactures at Aix, Angers, and Chalons; two schools of watch and clock-making; weaving schools at Nîmes, Amiens, and St. Étienne; several lace-making schools; a free school of political science, with a remarkable and exhaustive program of constitutional, legal, financial, and diplomatic studies; farm schools, agricultural colleges, and the Institut National Agronomique at Paris. Voluntary agricultural schools are active, and there are 12 State schools—*viz.*, agriculture, 3; horticulture, 1; dairying, 1; veterinary, 3; forestry, 2; and shepherds' schools and bergeries, 2.

Belgium is prominent in trade instruction. Her schools include:

1. Apprenticeship schools and *ouvroirs*, or workshop and school combined. These were established as charities, and are diminishing in number and importance.

2. Agricultural and horticultural schools, and schools for training dairymaids.

3. Girls' housekeeping schools, rapidly developing, over 250 having already been established.

4. Trade schools for girls, of which all the principal cities now boast one or more.

5. Parochial trade schools, those of St. Luke being the highest type.

6. Trade schools supported by guilds and trade-unions, such as the brewers' and tailors' schools.

7. Trade schools having day classes and shop-work. Their design is to fit for a trade and to do away with the often misdirected drudgery of apprenticeship.

8. Large industrial schools, sometimes combined with drawing schools, sometimes separate, where classes are held in the evenings and on Sundays and where the course is widely eclectic.

9. Drawing schools, existing in every town of any size in the kingdom.

10. Commercial schools, the most important of which is at Antwerp, with the object to prepare accountants, merchants, consular and commercial agents for home and consular service.

11. Schools of industry and mines, highly scientific in character.

In England, distinctive trade schools are not many. She is working out industrial education in other ways. Slow in establishing technical schools, technical education is being developed to-day in connection with numerous institutions. In 1836 a sum of £1500 (\$7299.75) was voted by Parliament for the encouragement of art, with which trade and navigation became associated. The first school of design was opened at Somerset House with 12 pupils in 1837. Subsequently a sum of £10,000 (\$48,665) was voted in aid of 14 schools, and by this means art education was provided for about 2250 pupils. In 1845 the Royal College of Chemistry was established in Oxford Street, London; and in 1851 the Jermyn Street Royal School of Mines was started. These institutions are now united under the title of the

Great
Britain.

Normal School of Science and Royal School of Mines, at South Kensington.

Commencing about the year 1882, what has been termed a technical education scare swept over England, owing to the fear that Germany was competing with increasing success for the foreign trade of the world. This advantage was believed to be due to her system of technical instruction. As a result of this apprehension concerning trade a great deal of attention was given to the subject during succeeding years. A royal commission was appointed by Parliament to inquire into the various technical and trade schools on the Continent, with a special view of reporting upon the effect the instruction given in these schools had upon the industries of the various countries in which they were situated.

In London, Finsbury College was then the only center, apart from the Polytechnic Young Men's Christian Institute, that gave evening manual instruction; and even at Finsbury the number of real artisans in attendance was very small.

By 1889 the art schools and classes, national scholarships, etc., in local schools, received £38,500 (\$187,360.25).

The total expenses incident to the conduct of schools of science and of art in all parts of the kingdom reached in 1889 the sum approximately of £154,000 (\$749,441).

Some of the schools established by institutions of learning as part of their educational system, or by individuals or industrial associations to advance particular interests, are as follows: Technical School, Newcastle-upon-Tyne; Durham College of Science, Newcastle-upon-Tyne; Owens College, Manchester; Yorkshire College, Leeds; Mason Science College, Birmingham; University College, Bristol; University College, Nottingham; University College, Liverpool; University College, Dundee; Glasgow and West of Scotland Technical College; University College, Cardiff; Sheffield Technical College.

Among schools established to advance local industries may be included the Manchester Technical School, Huddersfield Technical School, and Leicester Technical School. There are a large number of technical schools with social features, the Regent Street Polytechnic of London being the most notable example. There are several which are still incomplete, but which are doing excellent work. Among these latter are the Finsbury Polytechnic Institute, the South Lambeth Institute, the Albert Youth's Institute, and the Woolwich Polytechnic.

In technical education, various bodies have been active, such as the cooperative societies. Some municipal technical schools have been started, as at Rochdale and Manchester. Private firms have established technical schools in connection with their trades, as at Elswick, Crewe, Manchester, Accrington, Oldham. The technical colleges of Bradford and Leeds and the Yorkshire college compare with the weaving schools of Germany.

There is an intermediate technical college at Finsbury (London) for systematic teaching of boys from 14 to 18. The evening classes here in 1891 had over 1000 students. Its school of

electrical engineering is of wide renown. University College and King College have numerous technical and scientific classes. The Leather Trades in Bethnal Green teach hand and machine work. Polytechnic institutes are springing up in all parts of London.

The People's Palace schools are kept up by the Drapers' Company, and besides art and science, the technology of building, bricklaying, carpentry, plumbing, steam boiler design, machine construction, surveying, tailors' cutting, typography, etc., has been taught to hundreds of students. Besides these there are the Battersea Institute, the Borough Road Institute, the Chelsea Institute, the Northwest London Institute, the North London Institute, the City Polytechnic, and the Goldsmiths' Institute.

There were, in 1892, no fewer than 200 science schools in London, including day and evening schools and schools of science attached to elementary day schools. There are some 5000 students in the district schools of art in London. Through the country the newly established county councils are moving in the way of technical education.

In the United States, trade schools commenced with the New York trade schools, founded by Robert T. Auchmuty in 1881. They commenced as simply night schools with 33 pupils, and in 1893 had 536.

Schools of a like nature have been established by the Philadelphia Master Builders' Exchange and by the Pratt Institute in Brooklyn.

At Waltham, Mass., there is a horological school. Philadelphia has a textile school. In 1888 an artist artisan school was founded in New York. Michigan has a mining school. Through the country there are various mechanic institutes, art schools, music schools and academies, etc. The agricultural college and cooking schools are considered in separate articles.

In 1876 Professor J. D. Runkle, of the Massachusetts Institute of Technology, saw M. Della Vos's exhibition of the Russian system at the Philadelphia Exhibition, and on August 17, 1876, the department of the institute since known as the School of Mechanic Arts was established. The same step was taken a little later (June 6, 1879) by Washington University in St. Louis, at the suggestion of Professor C. M. Woodward, of the engineering department in that institution. These two examples were soon followed by other scientific and technological schools in different parts of the country.

Pardue University (Indiana) has schools in agriculture, horticulture, veterinary science, mechanical engineering, civil engineering, science, industrial art, and pharmacy.

There are 12 business colleges in Illinois, 16 in Iowa, 16 in Massachusetts, 28 in New Jersey, 16 in Ohio, 19 in Pennsylvania. The business college teaches how business is transacted in large cities in banking, real estate, insurance, and commercial houses. The students have to keep and work a bank in all details. So with other callings prepared for.

In the South, trade schools have been especially developed for the negroes. The John F. Slater Fund distributes \$45,000 annually among

**The
United
States.**

negro schools in the South expressly to foster hand training. Forty-four institutions received this aid in 1888, two of them for medical students. The Tuskegee Normal School enrolls 294 students, and requires all to work. The school farm is of 600 acres, 475 acres in woods. Its brickyard turned out 150,000 bricks in one year. There is a carpenter's shop and printing office. All the buildings on the school grounds have been erected by students' labor.

III. MANUAL TRAINING.

The thought of manual training as a part of education is not a new one. It has been a theme with educational writers from Luther and Comenius down to the present time. Rousseau would have Emile

Origin.

learn a trade, that his pupil might acquire a more valid title of nobility than any he might inherit from his ancestors. Pestalozzi resorted to manual training with the vagabond children he collected in his schools, believing it to be one important means of educating the poorer classes. Locke, in writing of the education of gentlemen's sons, pointed out some practical advantages to be gained from manual work by boys passing through the usual course of book instruction; the chief of which were the promotion of bodily health by physical exercise and the mental relaxation brought about by change of employment. But Froebel (*q.v.*) took the first steps.

The realization of Froebel's ideas in the kindergarten has made his name well known. What is not so well known is that to the influence of his writings is due the introduction of handcraft in the elementary schools of Finland and Sweden, where it is known as *slöjd* (*sloyd*), and whence it has spread to Denmark, Belgium, Germany, Austria, Switzerland, England, and the United States.

Had Froebel been permitted to finish his great work, *The Education of Man*, it is probable that the education of boyhood and of youth would have been worked out by him with the same attention to details and the same practical wisdom, but it was not until 1860 that a man of sufficient courage and force appeared in Finland and undertook to reconstruct the educational system of his native land in accordance with the principles of Pestalozzi and Froebel. This was Uno Cygnaeus, of the Helsingfors Teachers' Seminary, who, after long and diligent study of Swiss and German educational authorities, devised an advanced system of manual exercises adapted to pupils beyond the kindergarten age. This is sometimes called the Russian system of tool instruction, tho the term Russian system is now generally used to designate that plan of applying to the mechanic arts the laboratory (workshop) method of instruction—a method which has revolutionized instruction in chemistry, physics, and other sciences within the last 40 years.

It was in the Imperial Technical School at Moscow, Russia, in 1868, under its director, Victor della Vos, that this laboratory method of instruction was first successfully applied to the mechanic arts.

Manual training combined with ordinary

school work was first completely worked out in Sweden, commencing about 1876. There are over 700 schools in Sweden in which *slöjd** is taught. The normal school for this instruction is at Nääs, where a considerable number of teachers of the system are trained. The principles laid down are: (1) Voluntary attendance at *slöjd*; (2) *slöjd* work must be useful; (3) not fatiguing in tool exercises; (4) varied; (5) such as can be done by pupils themselves; (6) real work, not play; (7) not articles of luxury; (8) the work becomes the property of the pupil; (9) the pupil must be able to do it; (10) done with exactness; (11) neat and clean; (12) thoughtful, not merely mechanical; (13) strengthening to the body; (14) develop sense of form; (15) rich in manipulative detail. Again, the teacher of it should be the ordinary teacher, and he should superintend the work, but not handle it. It should begin at the eleventh year. *Slöjd* includes carpentry, turning, and wood-carving. *Slöjd* carpentry and trade carpentry differ. The former is small work; tools are different, and there is no division of labor.

From Sweden manual training ideas have gone to all countries. Belgium was one of the first to receive the ideas, and in different schools commenced teaching needlework, cooking, and woodwork. Germany is not remarkable for manual training, but perhaps only because she has so many technical and trade

Europe.

schools. Yet in 1888 a German report on manual training states that of independent school workshops there were 67 in 62 places; in teachers' seminaries, 12 in 12 places; in private and common schools, 12 in 12 places; in orphans' homes, 15 in 14 places; in boys' homes, 44 in 21 places; in reformatories, 10 in 10 places; in asylums for feeble-minded, 2 in 2 places; in blind asylums, 5 in 5 places; in deaf and dumb asylums, 7 in 7 places; in school workshops with industrial object, 12 in 12 places—a total of 186 school workshops in 120 places. The training was in pasteboard-work, wood-carving, joinery, metal-work, and modeling. Needlework is now taught in many schools.

Switzerland, like Germany, is not so prominent in manual training as in trade and technical schools, yet a good beginning has been made. Manual training classes for boys existed in 1891 in the cantons Grisons, Saint Gall, Appenzell, Thurgau, Schaffhausen, Zurich, Aargau, Basel, Soleure, Berne, Neuchâtel, Freyburg, Vaud, Glarus, and Geneva, over one half of the cantons.

Manual training for girls, such as needlework, knitting, darning, mending, etc., has existed in Switzerland for many years, and in most cantons it is considered as one of the most important branches of study for girls. In nearly all cantons this instruction is compulsory.

In France public education has been entirely remodeled since 1880. The law of 1881 made primary education absolutely free. The law of 1882 rendered attendance at school compulsory for children between the ages of 6 and 13 years,

* *Slöjd* has the same meaning as "sleight" in England, viz., *dexterous feat or practice*, only it is used of *workmanship*.

and gave to instruction a purely secular character. The law of 1886 organized primary education in its various grades of infant schools (known popularly as kindergartens), elementary primary schools, advanced primary schools, and schools of manual apprenticeship, as defined by the law of 1880.

In the infant schools kindergarten work is the rule. The elementary primary schools teach hygiene and cleanliness, ethical training, gymnastic and military exercises, reading, penmanship, French language, history, geography, civic instruction, arithmetic, geometry, elements of physical and natural science, agriculture and horticulture, and singing.

In Paris instruction in sewing has been given to girls since 1867. In the advanced primary schools in Paris, every school has a workshop for manual work in wood and iron, and the movement is spreading through the country.

Of the higher trade schools we have spoken above.

In England the movement has a growing hold. Among the most active agencies in furthering the cause is the National Association for the Promotion of Technical Education.

In 1887 the Drapers' Company placed £1000 (\$4866.50) at the disposal of the City and Guilds of London Institute for the promotion of manual training. Through the efforts of the guilds the school board established woodwork training in six centers in various parts of London for selected children from the board schools. The training began in January, 1888. The pupils attended once a week for a whole morning or afternoon, thus giving up one school attendance per week for the manual training. The six centers thus provided for the instruction of 584 children.

The experiment of the work has proved so successful that since 1890 the Government has carried on the work in board and lower grade schools in London and the provinces.

Kindergarten work in infant schools is now general. In the primary schools cooking and laundry are now recognized. Many cities employ special technical teachers who go from school to school giving science teaching in such subjects as magnetism and electricity, physiology, mathematics, hygiene, machine construction, or chemistry. Models, apparatus, and experiments are freely employed, and the interest of the scholars is kept at the highest point. Each school for older scholars receives a weekly or fortnightly lesson.

In the United States, manual training is in full swing. The Redfield (Maine) Wesleyan School seems to have united literary and manual training early in the century.

In 1867 Massachusetts citizens petitioned the Legislature to introduce schools for drawing free to all men, women, and children. In 1872

the State authorized by act of its Legislature the teaching of agriculture in *all* public schools, the establishment of industrial schools, and the teaching of navigation.

New Jersey moved in 1881. New York State passed in 1888 an act authorizing the industrial manual arts in the public and normal schools. Pennsylvania followed in 1883.

In 1879 St. Louis established the first manual training school, the experiments in classes had previously been made in Massachusetts and elsewhere. It was not a trade school, but aimed at complete education and arrested general attention, and similar schools were organized in Chicago (now a part of Chicago University), Baltimore, Toledo, Philadelphia, Cleveland, Cincinnati, Cambridge, Providence, Denver, and elsewhere.

The Pratt Institute, founded in Brooklyn in 1887, endowed by Mr. Charles Pratt, is one of the most complete in the country. It combines trade, technical, and manual training schools, and in 1894 had over 4000 students. There are departments of commerce, agriculture, trades of all kinds, library classes, and a department of domestic art and science, one of the most complete. It deserves special notice, including, as it does, courses of instruction unique in the combination of constant practical work with the most thorough study of artistic and scientific principles in their relations not only to good housekeeping, but to homemaking, to the preparation of clothing, of economical and wholesome food, and to such knowledge of sanitary and hygienic laws as will tend to secure comfortable and healthy homes at the least expense. The property of the Pratt Institute is now valued at over \$4,000,000.

The Drexel Institute of Art, Science, and Industry, at Philadelphia, is a new school of complex character. Opened in September, 1892, its work comprehends mechanic arts, business stenography, typewriting, cookery, dress-making, millinery, drawing, science, physical culture, science of all departments, art of all kinds, electrical engineering, mechanics, etc. The whole is the gift of Mr. Drexel, of Philadelphia. The Armour Institute, in Chicago, founded in 1893, is on the same lines.

In all the schools the course of instruction for the boys is substantially the same—*viz.*, joinery, wood-turning, wood-carving, pattern-making, molding, casting, forging, chipping, filing and machine-shop practice, together with drawing and the book work of the ordinary high-school course. From these schools manual training has gone into the elementary schools. Here Massachusetts, Connecticut, New York, and New Jersey have led.

Wood-working has been adopted more or less extensively in the grammar schools of Washington, D. C.; New Haven, Conn.; St. Paul, Minn.; Montclair, N. J.; New York City; Jamestown, N. Y.; and of Boston, Brookline, Springfield, Northampton, Waltham, and Salem in Massachusetts. It is also to be noted that the lively demand for good slöjd teachers indicates a widespread interest in the subject.

There are several State normal schools which, like that at New Britain, Conn., have adopted wood-working, not only that their pupils may understand the principles of manual training as a *method in education*, but also acquire the skill to construct the simple apparatus they may afterward need in their teaching. The kindergarten had entered the schools long before (see KINDERGARTEN) for girls.

The first branch of industrial education which found a place in the schools of Boston was sew-

ing for girls. As early as 1835 the girls of the second and third classes of the grammar schools were instructed in sewing and knitting by their regular teachers one hour a day. In 1854 a petition was presented to the school committee by a large number of Boston women, which resulted in the establishment of sewing for all fourth-class grammar-school girls, two hours a week, under the instruction of a special teacher for each school.

In Winchester, in 1873, a teacher was appointed for every class, teaching the highest classes to cut and fit their own dresses. In 1876, instruction in sewing, two hours a week, to the three lower classes in the grammar school, was established by the school committee. Since that year it has increased steadily in efficiency in all the schools. Classes in sewing for boys have been started. Cooking was first taught in the public schools in 1880. (See *COOKING SCHOOLS.*) Vacation industrial schools are organized in several places.

IV. ECONOMIC BEARING.

Industrial education to-day everybody believes in. The development of the body is recognized as a vital part of education (*g.v.*). Socialists, individualists, radicals, and conservatives, all are agreed to-day that industrial education should be carried to a far degree.

But there is a difference of opinion as to what form this industrial education should take. Working men and many not working men favor technical schools and general manual training, but oppose trade schools. Speaking of manual training, in an address before the Social Science Association, in 1884, General Walker says: "It is not so much the creation and endowment of separate schools of this character which is in view, as the gradual conversion of all the existing schools of the land to this use through the grafting of certain studies and exercises upon the traditional curriculum."

This is what working men desire.

Says Mr. George E. McNeill (*Report of Massachusetts Commission on Manual Training, Part III.*):

"The manual training school is a necessary substitute for part of that which has been lost to the children of to-day. . . .

"The 'Puritan,' sneered at by the dilettante liberals of to-day, was a hard man—hard to contend with, whether in the field of productive labor or destructive war, in religious argument or political debate. He was the best equipped man of his time. As populations increased and industries became more diversified, his adaptability was extended.

"Every home had its Bible, its library, musket, and tool chest. . . .

"A boy of 12 years of age who could not use the tools required for the manual training school of to-day was held to be below par. . . .

"In the crisis of the Union, men were found in the ranks of the New England volunteers who could do any kind and all kinds of work, and do it well. . . .

"The wage-worker of to-day, whether a hand tool or a steam or electric tool worker, is less and less required to depend upon himself in his work; his opportunities of development in his work are limited, as compared to those of former times. . . .

"Handicraft, as a means by which the masses of mankind can earn a living, is being replaced by machine-craft. . . .

"Learning a trade is like learning a dead language, useful as an accomplishment, but useless as an investment, save as it interprets a past mystery and disciplines the learner. . . .

"The plain men, labor reformers, who studied the industrial conditions and the evolutionary processes of development, foresaw that adaptability and availability were worth more than skilled ability. They were among the first to advocate and demand the kindergarten and the school of technology. They wrote, lectured, and petitioned that the school should be the place of resistance to the demoralizing influences of the rapidly decaying industrial and social system, and a source of persistence in the direction of the moralizing influences of enlightened civilization.

"That some working men should oppose the extension of school work to primary preparation for manual pursuits was to be expected. Men whose occupations are their life must needs be jealous of everything that tends to increase competition. They know by instinct, if not by experience, that wages, under the pressure of competition with other laborers in the same craft, will, like water, seek its lowest outlet; and they feel that resistance to lower wages, like resistance to tyranny, is obedience to God. . . .

"Our public schools are for the training of citizens, not mechanics, merchants, lawyers, or the other professions; and the youth is not correctly trained who enters upon the duties of citizenship with contempt for manual pursuits."

This quotation perhaps indicates the position occupied by the more intelligent working men of the world. They honor labor, and believe that all men should labor. They would have manual training taught to everybody, but they fear trade schools. Trade schools which, in their opinion, turn out *dilettante* workmen, feeling themselves superior to "ordinary" workmen, and refusing to develop the necessary trade-unions (see *TRADE-UNIONS*), they fear and oppose. They do not oppose good workmen, but they do not believe that trade schools are the place to produce real effective craftsmen. They argue that American and English mechanics who lead the world were not taught in trade schools, but in the workshop.

They would have in place of trade schools schools of technology, for the study and teaching of science and manual training for everybody, giving boys and girls that general adaptability to fit them to enter any trade workshop and become skilled craftsmen. On the other hand, many people regret the rule of machinery, and believe we need, besides the teaching of the workshop, where money alone rules, the teaching of trade schools, as in Europe, to teach hand-carving, artistic weaving, pottery-making, and good work of every kind. (For the question whether industrial education should be in the hands of the State or private individuals, see *EDUCATION*; *SOCIALISM*; *INDIVIDUALISM.*)

INEBRIATE ASYLUMS. See *TEMPERANCE.*

INGRAM, JOHN KELLS, was born in Donegal, Ireland, in 1823. He was educated at Newry School, and at Trinity College, Dublin, where he was successively scholar, Fellow, Professor of Oratory and English Literature, Regius Professor of Greek, and Librarian. In 1878 he became president of the Statistical Society of the British Association, when his address in that capacity on *The Present Position and Prospects of Political Economy* attracted much attention. He is the author of the article on

Political Economy in the *Encyclopædia Britannica* (9th ed.), and also contributed the article on Slavery, as well as biographical notes on many of the political economists. Both of these articles have since been published with slight enlargement in book form as *A History of Political Economy* (1888) and *A History of Slavery and Serfdom* (1895).

INHERITANCE TAX.—A tax on those acquiring property by inheritance or will; sometimes levied only on collateral relatives or strangers, and then commonly called a collateral inheritance tax. It is a tax that has been widely tried.

Says Mr. Max West, in the *Review of Reviews* for February, 1893:

"From the standpoint of political economy, as well as of law, the inheritance tax may be regarded either as a tax or as a limitation of inheritance. For at least a century, economists and statesmen have been pointing out glaring anachronisms in the existing law of inheritance. Jeremy Bentham proposed to abolish interstate inheritance except in the case of immediate relatives, and to limit the power of bequest of childless testators. John Stuart Mill went further, and proposed to limit absolutely the amount which any one should be allowed to take either by inheritance or bequest. The existing laws make it easy to forget that inheritance and bequest are not natural rights, nor even necessary consequences of the right of private property; and to many these proposals of Bentham and Mill seem almost communistic utterances. Yet no one has ever been able to give a good reason for the operation of intestate inheritance in modern times between distant relatives—relatives so distant that they know and care nothing of one another. As for Mill's proposal to set a limit to the amount of inheritances and bequests, it has within a few years been revived in so conservative a body as the Illinois Bar Association, and a bill for the purpose was introduced in the Illinois Legislature in 1887.

"The limitation of inheritance by means of a progressive inheritance tax is advocated alike in the writings of one of America's most talked-of millionaires on the one hand and in the platform of the Knights of Labor and the organ of the nationalists on the other. Andrew Carnegie and Edward Bellamy agree perfectly in this matter; both would like to see an inheritance tax rising as high as 50 per cent. in the case of multimillionaires. Four years ago Mr. Carnegie wrote as follows: 'Of all forms of taxation this seems the wisest. Men who continue hoarding great sums all their lives, the proper use of which for public ends would work good to the community, should be made to feel that the community, in the form of the State, cannot be deprived of its just share. By taxing estates heavily at death the State marks its condemnation of the selfish millionaire's unworthy life.'

"Collateral inheritances alone are now taxed in Pennsylvania, Maryland, Delaware, West Virginia, Connecticut, Massachusetts, and New Jersey, and they have at various times been taxable in several other States. The tax has existed in Pennsylvania since 1826, in Maryland since 1844, and in Delaware since 1860. In the other States it is of more recent date; Massachusetts adopted it in 1801 and New Jersey only last spring. The rate is in most cases 5 per cent., but in Maryland and West Virginia it is 2½ per cent., and in Delaware it varies from 1 per cent. for brothers and sisters to 5 per cent. for distant relatives. Bequests for charitable and educational purposes are generally exempt, as well as small amounts in other cases.

"The 'duties on estates of deceased persons' form one of the chief sources of revenue in Australasia. The rates are progressive in most of the colonies; in Victoria the maximum is 10 per cent., applying to estates of more than £100,000. The widow and children pay one half the schedule rates. In New South Wales the maximum is 5 per cent., and no favor is shown the direct heirs. In South Australia, on the other hand, the succession duty is graduated from 1 to 10 per cent., according to relationship alone; and there is a probate duty in addition. Until recently the highest rate in Australasia has been the 13 per cent. maximum of New Zealand; but by an act of last October Queensland now takes 20 per cent. of large amounts be-

queathed to persons not related to the testator. Tasmania has a slightly progressive tax, levied on personally alone.

"At the Cape of Good Hope the inheritance tax was introduced nearly 30 years ago. The rates are from 1 to 5 per cent., according to relationship.

"The United Kingdom has a complicated system of 'death duties,' as Mr. Gladstone has named them, known separately as the probate, account, legacy, succession, and other duties. The probate duty, which must be paid before the estate can be settled, and the account duty on gifts, which, strictly speaking, is not a death duty at all, apply to personally alone, and the rates approximate 3 per cent. The legacy duty on personal property and the succession duty on realty and settled personally are graduated according to relationship. The estate duty is an additional 1 per cent. tax on property amounting to £10,000 or more; so that its effect is to make the death duties slightly progressive. There is an annual tax in lieu of death duties or corporations. A municipal death duty for London is a possibility of the future.

"The heaviest inheritance taxes on the continent are levied in Switzerland. In Geneva distant relatives pay 15 per cent. In six cantons the rates are progressive. When there is no will, the little canton of Uri taxes distant relatives 20 per cent., and even more on the excess above 10,000 francs.

"In Germany the Erbschaftsteuer nowhere applies to direct heirs except in Alsace-Lorraine. Herr Miquel tried to extend the Prussian tax to direct heirs in 1890, but failed. The rates in Prussia are from 1 to 8 per cent., according to relationship.

"The French law taxes the gross value of the property, without allowing deduction for debts—an unusual feature, which has caused much dissatisfaction. The maximum rate is 1½ per cent.

"Austria, Italy, Spain, Belgium, Holland, Denmark, Norway, Russia, Poland, Roumania, Monaco, all have inheritance taxes.

"The tax has been found to be quite satisfactory in its practical operation and productive of very considerable revenues. It has not driven away capital, because men would rather pay their taxes after death than at any other time. It is difficult to evade, and the cost of collection is not heavy. In New York especially it has become one of the principal modes of taxation. For the three years before the New York tax was extended to direct inheritances, the average yield was more than \$1,000,000—far more than the State tax on personal property and nearly as much as the corporation tax; and in the fiscal year 1902, with the new law partly in operation, the payments amounted to nearly \$2,000,000. In Pennsylvania the collateral inheritance tax yields about \$1,000,000 annually."

In Practice.

Of the objections to the tax, Mr. West says (*Political Science Quarterly*, vol. viii., p. 441):

"The classical objection to the inheritance tax, urged by Adam Smith and Ricardo, is that it is a tax on capital. This objection has also been applied to the property tax; but the inheritance tax is perhaps more likely to be paid out of capital than an annual property tax. It has been pointed out, however, by Mill, and more recently by Leroy-Beaulieu, that whether a tax will be paid out of capital or out of income depends not so much upon the mode of taxation as upon the amount of the tax and the time allowed for payment. And even if the tax is paid out of capital in a given case, it does not follow that there will be any diminution of the national capital. Over against the objection that the tax will be paid out of capital there are two counter arguments: first, that being levied only when the taxpayer has just received a mass of property, it is easily and conveniently paid; and second, that by diminishing large fortunes it tends to bring about a more equitable distribution of wealth. This second argument will of course apply only when the tax is progressive, or when small amounts are exempt.

"Adam Smith also charged the inheritance tax with violating his canon of equality, 'the frequency of transference not being always equal in property of equal value.' It has been suggested that this cause of inequality will operate in the long run between families, because of hereditary differences in longevity. This objection can be sustained only by regarding the inheritance tax as a property tax paid once in a lifetime. If the tax is considered as a limitation of inheritance, or as a fee, or as a tax resting upon the

increased taxpaying ability of the heir, there is no inequality in exacting it as often as the devolution occurs. . . .

"The courts have frequently attempted to define the nature of inheritance taxes, but their deliverances on the subject do not agree. The United States Supreme Court decided that a tax which Louisiana formerly levied on foreign heirs was an exercise of the State's power of regulating inheritance and bequest. . . . Inheritance tax laws have been declared unconstitutional for particular reasons in Minnesota and Wisconsin, and in New Hampshire this mode of taxation was declared to be unequal and unjust. New Hampshire is the only State in which it has been held to be unconstitutional for reasons which apply to inheritance taxes in general; and it has often been declared not to conflict with the requirements of equality and uniformity."

INITIATIVE. See REFERENDUM.

INJUNCTIONS.—An injunction may be defined in law as an order by a court possessing equitable powers, commanding a designated person or designated persons to desist from some action commenced or proposed, to restore to its former condition something which has been interfered with or violated, or to perform certain acts. Only recently, however, in English and American jurisprudence have injunctions been mandatory. Until now they have been simply used in restraint of action. In Roman law, however, whence they have come into modern jurisprudence direct, they were mandatory, and were extensively used, but called interdicts. They were issued by the pretor and other magistrates, and afforded large powers of compelling or preventing action, giving Roman law great practical and all but imperial efficacy.

Recently they have been used in America in ways and to a degree which some consider revolutionary, as giving to courts of equity powers all but or quite imperial and destroying the immemorial Anglo-Saxon rights of trial by jury. This is, however, both strongly asserted and denied. (For a review of the facts concerning the recent use of injunctions, see COMBINATION LAWS.) We give here two careful views, one supporting, the other condemning the recent extension of the injunction. In the *Forum* for May, 1893, Mr. A. F. Waiker says:

"Four extremely interesting opinions concerning the rights and obligations of working men have recently been rendered by Judges Taft, Ricks, Speer and Billings, sitting in various divisions of the United States Circuit Court.

Conservative Newspaper comment upon these decisions has been quite misleading, being often apparently based upon conjecture rather than actual knowledge concerning the points decided. Their scope and extent may be briefly summarized as follows: Judge Ricks holds that a mandatory injunction may issue requiring employees fully to perform their duties connected with interstate commerce, so long as they remain in service. Judge Taft rules that acts tending to induce a boycott which would interrupt the movement of interstate commerce may be prevented and corrected by like process. Judge Billings affirms the propriety of an injunction against a combination of laborers acting in restraint of trade or commerce. Judge Speer approves a receiver's contract for labor, but makes it subject to conditions which eliminate the boycott.

"Each of these decisions rests upon the federal control of interstate commerce, as expressed in the Interstate Commerce law and the Anti-Trust law. The novelty in each is in the remedy employed. Illegal acts of the nature in question have heretofore been approached judicially in actions at law or by indictment. In the fourth section of the Anti-Trust law jurisdiction by injunction is specifically conferred. The Interstate Commerce act contains no such affirm-

ative provision. Judge Ricks recognizes the fact that his use of the process is new, and says:

"Every just order or rule known to equity courts was born of some emergency to meet some new condition, and was therefore in its time without a precedent."

"He refers to two mandatory injunctions recently issued, one compelling the Union Pacific Railway Company to permit certain other companies to use the Omaha bridge, under a continuing contract previously made between them to that end; and the other compelling the Wabash Railroad Company to permit another company to use certain tracks and facilities at St. Louis under a similar contract. In the latter case it was said by the Supreme Court of the United States (Justice Blatchford) as follows:

"It is one of the most useful functions of a court of equity that its methods of procedure are capable of being made such as to accommodate themselves to the development of the interests of the public, in the progress of trade and traffic, by new methods of intercourse and transportation. . . .

"The original office of the injunction was negative rather than affirmative; to restrain, not to command. The text-books abound in authorities to the effect that equity will not enforce the specific performance of a contract; will not interfere to prevent a crime; will not enjoin acts for which a remedy at law exists.

"While practitioners of the old school are somewhat aghast at the enlargement of equity jurisdiction upon which the Federal courts have of late so distinctly entered, there is much to be said in support of its propriety. Other remedies are exceedingly inadequate, often involving innumerable suits at law; contracts not performed are practically valueless; damages are often difficult to assess, and impossible to collect; insolvency has always been considered as presenting an exceptional case; crimes which invade private rights have at times been prevented by injunction; the power in question rests upon the thought expressed by Judge Brewer in the Nebraska case above referred to, where he said:

"I believe most thoroughly that the powers of a court of equity are as vast and its processes and procedure as elastic as all the changing emergencies of increasingly complex business relations and the protection of rights can demand. . . .

"This use of the writ of injunction will afford a speedy and effective solvent for many evils which hitherto have been permitted to run their course. It may at times operate in favor of the laboring classes as well as against them, for the lockout must be subject to like rules with the strike. It will often prevent the necessity of military intervention to repress excesses and disorders. The law forbids the boards of directors of a railroad company from wantonly interfering with the rights of connecting lines; this principle is now extended to employees and their organizations; a corporation can act only through agents, and none of the agents or employees are above the law. Our people are occasionally surprised at the sudden development of a new situation in the law or in its administration, but they immediately adapt themselves to the changed conditions, and the wheels of trade and commerce revolve with less friction than before.

"Contests over wages and terms of service will always exist, until human nature is revolutionized, or the Government is sufficiently paternalized to take charge of the subject of wages generally. But the public is entitled to minimize these evils so far as practicable, and to confine the contest to the actual parties, to prevent interference with the rights of others, and to restrict the contestants to the exercise of their own lawful rights, restraining all illegitimate excesses.

"To this end the process of injunction is peculiarly adapted, and when it is exercised with the care and self-restraint exhibited by the judges whose decisions have been analyzed there can be no danger in its use.

"The questions of legal right covered by the cases present nothing new. Their application to interstate commerce gives jurisdiction to the Federal Courts. This opportunity is of recent origin, being consequent upon recent statutes enacted under the constitutional power of Congress to regulate commerce among the several States. It has always been the legal obligation of employees to perform fully their contract of service, whether by the year, month or day, and of employers to pay compensation for the term agreed upon; employees are legally responsible to employers for the results of their negligent acts and wilful omissions, and employers are in turn responsible to them for the furnishing of safe and sufficient machinery and working room; both are subject to the rule that one's own property (or rights) must be so used that

others be not unnecessarily injured; and both are within the law which condemns conspiracies and combinations to oppress.

"The only extension or enlargement perceptible in the recent cases is in the use of the mandatory injunction for the enforcement of well-known rights and obligations; this is supported by precedents in other directions and can be employed without objection, being wholly in the direction of the preservation of personal rights and the protection of public interests."

On the other hand, Mr. F. J. Stimson, in an address delivered before the Young Men's Democratic Club of Massachusetts, and published in the *Political Science Quarterly* for June, 1895, says:

"What are the facts? Briefly these:

"We have seen, in private lawsuits between individuals or corporations, courts of equity—civil, not criminal courts—invoked to restrain, not alone parties to the suits, but anybody, the whole world, with or without actual notice of a court order or injunction, not merely from interfering with property which is the subject of the suits, but also from committing or conspiring to commit, or aiding or advising others to commit, acts which are criminal; and sometimes only on the ground that they are criminal acts—criminal at common law, or made so by the recent statutes known as the Anti-Trust Law and the Interstate Commerce Law. We have seen more: we have seen persons committing, or about to commit, or said to be about to commit, such acts, arrested by these civil courts, deprived of their liberty and punished by imprisonment; and this, as in the Debs case and others, after the emergency which furnished the excuse for invoking the protective jurisdiction of the equity court has long gone by. And we have seen persons so punished without the usual safeguards of liberty afforded by the criminal law—without indictment, without right to counsel, without being confronted with witnesses, without trial by jury—and sentenced without uniform statute, at the discretion of the judge.

"We have seen more: we have seen courts, not content with ordering all the world what not to do, order at a word the 10,000 or 20,000 employees of a railroad system to carry out each and every the definite or indefinite duties of their employment as directed by any of their superior officers, or by receivers of the courts themselves, so that for any failure or omission or merely negative act on the part of one of these employees, he may be summarily brought into court and punished, either at that time or later, as the court may find leisure to sentence or its attorneys to file complaints. Take one example of many. Judge Ross, in the case of the Southern California Railroad vs. Rutherford, where the bill alleged that the defendants continued in the employment of the complainant company, and yet refused to perform their regular and accustomed duties as such employees, said:

"It is manifest that for this state of affairs the law—neither civil nor criminal—affords an adequate remedy. But the proud boast of equity is: *Ubi jus, ibi remedium*. It is the maxim which forms the root of all equitable decisions. Why should not men who remain in the employment of another perform the duties they contract and engage to perform? It is certainly just and right that they should do so, or else quit the employment. [And in conclusion,] I shall award an injunction requiring the defendants to perform all of their regular and accustomed duties so long as they remain in the employment of the complainant company, which injunction, it may be as well to state, will be strictly and rigidly enforced."

"We have seen yet more. By the act of 1890, commonly known as the Anti-Trust Law, it is declared that 'every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce among the several States,' is illegal; and by the fourth section, the attorney-general, or any district attorney, upon the information of any individual, is authorized to institute proceedings in equity, in the name of the United States, to prevent and restrain violations of the act.

Furthermore, by the Interstate Commerce Act of 1887 it is made a criminal offense for railroads, their officers or employees, to refuse to perform their duties as common carriers, and to refuse to receive the cars and passengers of other railroads or companies; as a result of this a strike of such employees becomes in effect also a conspiracy against interstate commerce.

Radical Views.

"The first attempt to enforce the Anti-Trust Law was made in a case here in Boston, before Judge Putnam of the federal court. Judge Putnam wisely refused to extend the meaning of this act beyond its expressed words, and said: 'It is not to be presumed that Congress intended to extend the jurisdiction of the courts of the United States to repressing strikes and boycotts, without very clear language.' If the courts had stopped there, there would be little need for this address. But since then what changes have happened!

"The Attorney-General of the United States, or his district attorneys, acting for the United States in the exercise of its sovereignty as a nation, has sued out injunctions in nearly every large city west of the Allegheny Mountains. Injunction writs have covered the sides of cars; deputy marshals and federal soldiers have patrolled railway yards; chancery process has been executed by bullets and bayonets. Equity jurisdiction has passed from the theory of public rights to the domain of political prerogative. In 1888 the basis of jurisdiction was the protection of the private right of civil property; in 1893, it was the preservation of public rights; in 1894, it has become the enforcement of political powers.

From being applied to parties to a suit, the process of contempt has come to be applied to large bodies of men who may never have heard of the suit which gave it rise. For instance, the Chicago 'omnibus bill' of last summer was filed to prevent interference with 23 great railroad systems, and the injunction issued not only against several members of the American Railway Union by name, but against as many thousands unnamed; and, to prevent a possible confusion of identity in the defendants, it was further directed to 'all other persons whomsoever.'

"The history of jurisprudence surely furnishes no precedent in which the chancery has called out the military in aid of an injunction writ. . . . The public anxiety has some legal ground. Briefly, the objections are three:

"1. This course of things does away with the criminal law and its safeguards of indictment, proof by witnesses, jury trial, and a fixed and uniform punishment. Most of these offenses might well have been the subject of criminal prosecution; and the bill of rights of our constitution says that in all criminal prosecutions the accused shall enjoy the right to a speedy and public trial by an impartial jury of the State and district wherein the crime shall have been committed; to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

"2. It makes the courts no longer judicial, but a part (and it bids fair to be a most important part) of the executive branch of Government. More briefly and picturesquely: the federal courts may thus grow into mere star-chambers and run the country—as they already run nearly half our judiciary.

"3. It tends to make our judiciary either tyrannical or contemptible. If we do not fall under a tyranny, such as might have existed in the England of Charles I. or such as does exist in the South America of today, we shall fall into the almost worse plight of finding an injunction of our highest courts a mere *brutum fulmen*—an empty threat, a jest and a byword; so that through their own contempt process the courts themselves will be brought into contempt. . . .

"There is nothing new under the sun. . . . In 1382 the commons complained to the king of grievous oppressions caused by the power of great barons, who rendered the remedies of the common-law courts of no avail. Accordingly the judges of these courts themselves were placed under the special supervision of the chancellor, and the chancellor began to exercise his authority in repressing disorderly obstructions to the course of law, and in affording civil remedy in cases of outrage which for any reason whatever could not be effectually redressed through the ordinary tribunals. Thereupon, however, the commons took great umbrage at the exercise of such authority on the part of the chancellor, claiming that his jurisdiction was an interference with the common law; but the king persevered, stating that he would preserve his prerogative; and a resort to the chancellor under his ordinary jurisdiction was thus secured for the poor, the weak and the friendless, to protect them from the injuries to which they were exposed. . . . Even the court of Star Chamber had originally a similar jurisdiction, and it was first used to prevent cases of oppression and other exorbitant offenses of great men, where, as Lord Coke says, inferior judges would,

in respect to the greatness of the offenders, be afraid to take jurisdiction. . . .

"The court of Star Chamber, as Spence explains, was perverted from its original purposes; and having become odious by the tyrannical exercise of its powers, it was abolished by statute in the time of Charles I., just before the Commonwealth was established. . . .

"So far, history. And I think you will say it has but repeated itself. Are we to go back? Have liberty and property again grown so insecure under the common law that the extraordinary power of the sovereign acting through his chancellor—that is, of the United States Government acting through its equity courts—is again to be invoked? And will the federal government, stretching to the last point of prerogative the phrase of the Constitution giving it power to regulate commerce among the several States—for the meaning of those simple words has grown, from the mere prohibition of imposts and interstate duties or taxes upon the carrier, to the control of the reward of the carrier; and from that (as the United States Labor Commissioner demands), to the wages of the carrier's servants; and from that, to criminal jurisdiction over all persons concerned in transportation; and from that, now, to an executive ordering of the whole business by the federal courts—will the federal Government, through its courts as did King Richard II. in 1382 to the Commons: The sovereign will preserve his prerogative?"

Remedies.

Before suggesting remedies, I want to call to mind again the fact that the revival of these old equity powers has been caused chiefly by one particular law, passed by the Congress of the United States four years since, supposedly in the interest of the people and of the laborer, and known as the Anti-Trust Law. A striking example of the danger of extraordinary legislation, whether demanded by the masses or by the classes! I agree with Mr. Wright that, if this goes on, the nation will have to own and run the railroads in theory as well as in fact, and Democrats at least should not believe that this is any part of the duties of our national government. Nor do I think the machinery of any true democratic government is arbitrary and tyrannical enough to stand such a strain.

"Leaving out the question of this Anti-Trust Law and its provisions, and the Interstate Commerce Law, which, on one short clause in the Constitution of the United States that 'Congress shall have power to regulate commerce among the several States,' hang all this extraordinary jurisdiction and law-making—leaving aside these two radical and extraordinary statutes, it seems as if the question we have asked might be thus solved:

"1. Let the courts of equity go back to their proper jurisdiction as civil courts. . . .

"2. Let no person be punished in an equity action for contempt not committed in presence of the court, unless he is a party to the suit, or the servant or agent of a party, or has been personally served with a copy of the injunction order. . . .

"3. In any case where both a crime and an infringement of a property right are involved, the injunction will have to issue as to the property right, and be valid as a concurrent remedy with the criminal process; but let not *ex post facto* punishment be inflicted where there is a criminal penalty. . . . It would be easy to provide that the finding of a judge in the contempt process should take effect as the presentment of a grand jury. Then Debs, or any other person complained of, could be at once handed over to an ordinary officer of the criminal courts, to be locked up or bailed until the time of trial, then to be tried by a jury of 12 men, and, if found guilty, to be sentenced as a criminal, according to the law of the land and the Constitution of the United States."

INNER MISSION.—The so-called Inner Mission of Germany originated in a *Memorial to the German Nation*, written in 1848 by Pastor Wichern. This was a passionate appeal to turn the energy of the Church toward every social need. It argued that the causes of all suffering are moral; that the Gospel is the only cure, but that the Gospel must be applied to all life. As a result, a very great movement has resulted, the Protestant Christian Socialism (*g.v.*) of Germany mainly developing on this

line. Houses of Brothers (16) and of Sisters (63) have been established to train workers. In 1890 they had an income of nearly \$2,000,000. Agencies for reform of all kinds have been established—444 lodging-houses (*herberge*) have been opened, 5900 schools for Sunday (tho not called Sunday-schools), 2209 schools for the care of children, 25 asylums for fallen women, 42 day nurseries, 588 houses for the sick, 426 homes for travelers. Labor bureaus and boys' clubs have been planted in almost every German city. The bureaus in 1890 found 15,000 situations. In 1891 poor children from 121 places in Germany were sent to seashore or country. The movement is spreading to other lands.

Reference: A series of articles in *The American Journal of Sociology* for 1896.

INSANITY.—It is generally supposed that insanity is on the increase in civilized countries, owing to the increasing complexity and intensity of life, and the statistics seem to bear this out; but many hold that such is not the case, and that the apparent increase is due to more careful registration, and, above all, to the growing custom of placing the insane in asylums. According to Professor R. Mayo-Smith's *Statistics and Sociology* (p. 221) the number of insane persons treated in public and private asylums in the United States was 56,205 in 1881 and 97,535 in 1889, an increase of 73 per cent.; but the number of insane per 1,000,000 of population was 1833 in 1880 and only 1697 in 1890. The census of 1891 in England showed an increase of the total number of lunatics since 1871, but calculated that this was due to the better care given to them and the consequent prolongation of life. In 1889 there were 85,345 insane persons (including idiots) in England, or 2907 per 1,000,000. In Ireland, the proportion of lunatics to 1,000,000 of the population was 775 in 1851, and in 1891, 3174. The proportion of idiots was in 1851, 750 per 1,000,000, and in 1891, 1326. Since 1881, however, there has been a decrease. In Scotland, lunatics increased from 2250 per 1,000,000 in 1881 to 2596 in 1891, while idiots decreased from 1603 per 1,000,000 to 1246. There are more women insane than men in Sweden, England, Scotland, and Ireland. In Austria and Hungary men lead. In Ireland, 79.6 per cent. of the mentally deranged were unmarried. In 1891, in Ireland, 41 per cent. could read and write. In Massachusetts, in 1885, there were 2344 insane men and 987 idiots; there were 2919 insane women and 651 idiots.

There has been great progress in modern times in the care of the insane. Pinel, in 1792, took a great step forward in liberating 53 patients at Bicêtre who had been in chains. Franklin, in 1750, succeeded in establishing a department for the insane in the Pennsylvania Hospital. To-day there are 135 public and 117 private insane asylums in the United Kingdom. In the United States, they exist in every State except Delaware, Florida, and Nevada.

INSTITUTIONAL CHURCHES.—The phrase "institutional church," first used, it is believed, by President Tucker of Dartmouth College, applied to Berkeley Temple, Boston,

Mass., has recently come into use describing a church that works on all lines of human improvement. The Rev. C. A. Dickinson, pastor of Berkeley Temple, Boston, says of the institutional church :

"If I were to define it, I should say that it is an organization which aims to reach all of the man, and all men, by all means. In other words, it aims to represent Christ on earth, in the sense of representing Him physically, morally, and spiritually to the senses of the men and women who live in the present age. The Institutional Church aims to provide a material environment wherein the spiritual Christ can express Himself, and be felt among men as when He was here in the flesh, and it begins by planting itself just where Christ stood and worked when He was on the earth—in the midst of publicans and sinners."

Different institutional churches work in somewhat different ways. St. George's, New York City, one of the first churches to work on this line, with its magnificent parish house, naturally puts much of its strength into educational and industrial work, and its admirable equipment helps it to obtain a peculiarly strong grip upon young men. The Fourth Church of Hartford, Conn., emphasizes evangelism, and has been remarkably successful in reclaiming the fallen. At the Jersey City Tabernacle the amusement features are kept to the front, and the church aims especially to fill the leisure hours of the working young men and women who flock to it full with wholesome pleasure. At Berkeley Temple, Boston, while other lines are not neglected, an exceptional amount of energy is put forth through the Church office in attending to the wants of all sorts and conditions of men and women who are in need of sympathy, advice, and succor.

But while all these churches have their distinctive differences, they are alike in certain fundamental characteristics. They either make their free pews absolutely free or else adopt a system which practically secures free pews. They all believe in a church open all the week and made a center of social life. They all develop church workers, and make their services attractive with popular music, etc. They exist in all denominations, but have been particularly developed in the Protestant Episcopal Church and in the Congregational. St. Paul's Church, in New York City, is an example of a most successful Roman Catholic institutional church. They exist, too, all through the country, as in the Plymouth Church in Milwaukee, and the Tabernacle in Denver. Many churches, too, in the smaller towns are working on the same lines, and everywhere they are successful, as is shown by the congregations they draw, the number who are added to the Church, the spiritual life, and the practical benefits they conduct. The institutional church "begins with the people just where they are, meets the needs of which they are conscious, and so generally leads them to be conscious of needs higher and nobler."

INSURANCE.—Insurance may be defined as a contract of a company or person to pay a sum or sums of money to indemnify the insured, or a designated beneficiary, in case of loss through the happening of certain events which constitute the risk insured against.

HISTORY AND STATISTICS.

Insurance is mainly a modern development,

tho it originated in the remote past. It was known to the ancients, but was chiefly developed by more recent mercantile adventures. It began by men agreeing to divide among themselves the burden of the loss of ships or cargoes in the days when commerce was the fitting out of ships for single, long expeditions. This custom arose in England in the Elizabethan era. It had appeared in Southern Europe earlier than that.

Insurance depends on the law of probabilities. It is said that the doctrine of probabilities was developed about the year 1650, when the Chevalier de Mere, a Flemish nobleman, who was both a respectable mathematician and a gamester, attempted to solve the problem of dividing equitably the stakes when a game of chance was interrupted. The problem being too difficult for him, he sought the aid of the famous Abbé Blaise Pascal, one of the most accomplished mathematicians of any age. Pascal solved the problem, and in doing so enunciated the "doctrine of probabilities," or laws governing so-called chances.

This doctrine or theory Pascal illustrated by the throwing of dice. When a single die is thrown, the chance of turning up an ace is precisely one out of six, or one out of the total number of sides or faces. But if a large number of throws are made, it will be found that each face will be turned up an equal number of times. From this Pascal laid down the proposition that results which have happened in any given number of observed cases will again happen under similar circumstances, provided the numbers be sufficient for the proper working of the law of average. Thus the duration of the life of a single individual is one of the greatest uncertainties; but the duration, or rate of mortality, of a large number of individuals may be predicted with great accuracy by comparison with the observed results among a sufficiently large number of persons of similar ages, occupations, and climatic influences.

From this principle insurance has developed on a scientific basis. It is of many kinds. Fire, marine, and life insurance are the best known; but accident, liability, plate glass, steam boiler, elevator, burglary, sickness, guarantee, mortgage and title, hail and live-stock insurance have each reached large

History.

proportions. All of these branches of insurance are in successful operation in the United States and Europe. Many other branches of insurance have been suggested, and in some cases attempted, among which are: Insurance against loss of occupation; insurance of premiums paid for stocks or bonds, which are subject to redemption; insurance against issue and survivorship; insurance of marriage portions for daughters; insurance against divorces; insurance against celibacy. A queer sort of insurance has been issued in Switzerland against death or injury by "tiles that may drop on the passer's head."

The earliest form of insurance was by means of individual underwriters, each one assuming a fixed proportion of the aggregate amount fixed. In London, the venturesome who took part in this underwriting used to meet at Lloyd's Caf-

fee-house, from which fact the name of Lloyd's was given to this form of insurance. Within the last 10 years this form of insurance has been revived in the United States, and especially in New York; but, as a general thing, insurance is carried on by corporate companies which are either mutual or stock, and which are subject more or less to Government supervision.

Sheppard Homans, an eminent actuary, says of this in the *North American Review*:

"The system of government supervision or control varies in different countries. In Great Britain and continental countries in Europe companies are required to report general facts only regarding income, disbursements, assets, insurances in force, and liabilities estimated by themselves. In the United States, where every State is a sovereign, there are 44 different insurance departments. Each State may impose such conditions, restrictions, and taxes upon corporations of all other States having to transact business within its sacred territory as its legislators may deem proper. As a result, the laws, taxes, and requirements vary greatly, and impose serious burdens and expenses upon companies, which, of course, are borne by their policy-holders. On the other hand, each company is obliged to answer in minute detail questions regarding its business, so that its condition may be made clear to the general public, as well as to persons directly interested.

"The American system, then, is one of paternalism, while the British system is one based upon freedom and publicity. Paternal supervision involves, logically, paternal responsibility. State control means State guarantee. Persons who insure in reliance upon governmental certificate of solvency would, in justice, have a claim for compensation should that certificate be misplaced. But such claim could scarcely be enforced in the United States.

"On the other hand, the British system of freedom and publicity enables unsound or swindling companies to prey upon the general public, which has no means of acquiring exact information regarding the condition of an institution other than the reports and statements of its officials.

"Probably the best system would be a happy mean between the two, where the supervision of the State would combine the maximum of freedom and publicity with the minimum of interference necessary to the ascertainment of solvency and honesty of management."

Fire insurance seems to have been the first to develop its modern form. A regular office for insuring against fire was opened in London in 1681. The great fire of 1666 was the exciting cause. According to the *Encyclopædia Britannica*, the older fire insurance companies were organized, as follows: The Hand in Hand, 1696; the Sun, 1710; Union, 1714; Westminster, 1717; London, 1720; Royal Exchange, 1720; the Salop, 1780; Phoenix, 1782; Norwich Union, 1797. The first fire office in Scotland was established in 1720, the first in Germany in 1750, and the first proprietary company in that country in 1779; the first office in the United States was established at Philadelphia in 1752, one of its early directors having been Benjamin Franklin; the first in France dates from 1816, and the first in Russia from 1827.

According to the same authority, the essential principle of fire insurance is the distribution of loss. It does not aim, directly at least, at the prevention and only in a secondary way even at the minimizing of loss.

The extinguishment of fire is commonly undertaken by municipalities, the fire insurance companies often sustain patrols to care for property. (See FIRE DEPARTMENTS.) In the United States, fire insurance has been greatly developed.

Life insurance, tho starting later, has reached a higher state of development than fire insurance. It began at near the first of the eighteenth century.

The Grand Pensioner DeWitt, of Holland, was the first to reduce these theories to practice, which he did in 1693, by calculating the true values of annuities, based upon observed rates of mortality. Dr. Halley, Astronomer Royal of Great Britain, was the first to discover and arrange what are called life tables from which all monetary values depending upon the chances of living and dying, combined with the improvement of money by interest, may be computed. He has been called the father of the modern system of life insurance. These tables have now only a historical interest. Various other tables have been used, such as the Northampton, Carlisle, Equitable Assurance, English Life, Seventeen Offices, American Experience, Thirty American Offices, and many others.

About the close of the seventeenth century there were also several annuity schemes launched, such as the Mercies Company, of London, for the benefit of widows and orphans of the Church of England. The first life insurance company was the Amicable Society, chartered in 1706. In 1762 the Equitable was chartered, and began issuing policies payable at death, upon the lives of persons of any age, charging premiums according to age. The Royal Exchange and London Assurance, however, had both been doing this business without charters for 40 years. In the United States, the Presbyterian Ministers' Fund, of Philadelphia, was chartered in 1759 by Thomas Penn, for the insurance of Presbyterian clergymen. In 1769 a similar institution was chartered for clergymen of the Church of England. The former has survived, but not the latter.

Recent History.

In 1812 a company called the Pennsylvania was chartered; in 1830 the New York Life Insurance and Trust Company, which is still in existence, but does no life insurance business. The Mutual of New York, the first of the mutual companies, was organized in 1842, and from 1845-60 many new companies were organized. In 1858 the State of Massachusetts originated a system of State supervision, and it was immediately followed by the State of New York. The Massachusetts department adopted the Seventeen Offices, commonly known as the Actuaries' Table, as its standard; and the New York department, the American Experience Table, which was a modification of the Seventeen Offices Table, in the light of experience of the Mutual Life Insurance Company.

Life insurance companies nowadays issue a variety of immediate and deferred annuities, temporary and whole life insurance, the latter often paid for by a limited number of payments; and a large variety of endowment, tontine, and other investment policies. The companies are mutual, proprietary, or mixed, according as all the savings and profits belong to the insured or all belong to the stockholders, or stockholders receive a part and the policy-holders the remainder. Mutual companies alone have no capital stock. While nominally the members control mutual companies, the practical operation of

the proxy system of voting makes the managers all-powerful.

Originally the companies did not give cash or other surrender values for their policies. It was made compulsory for Massachusetts companies to do so by a State law early in the sixties, and not long after it was also made compulsory for New York companies to give paid-up insurance upon surrender; notwithstanding which, by waiving the law, several companies set out on a career of tontine policies, which were originally wholly forfeitable, but which held out to a persistent policy-holder hopes of very large profits if he survived and sustained his policy. These hopes were not realized, and to-day but one company in the United States is writing a policy the name of which contains the word "tontine," altho several are issuing policies which, while allowing liberal surrender values, give all the profits to the persistent survivors.

One result of the reaction from cash surrender legislation which took the form of tontine insurance was the organization of a large number of mutual assessment life insurance associations. More than one half of all the life insurance now in force in the United States is in these organizations, and many more than one half the number of persons carrying insurance. They have furnished insurance on three different plans—*viz.*, first, by assessing the same amount on members without regard to age, whenever there were losses; second, by assessing according to certain ratios fixed at age of entry; third, by assessing according to certain ratios according to the actual age attained at time of assessment.

Mutual Assessment Companies.

Associations using the first of these systems have nearly all gone out of existence. Associations using the second, which came later into use, are now having an unpleasant experience, and are likely to be driven out of existence unless they reform their plan. There is no scientific reason why associations using the third system should not continue indefinitely. Most of them, however, seek to create a level price in spite of the increasing cost by charging more than the insurance costs during the earlier years, with a view to offsetting the increased cost during the latter years. The success of such associations will de-

pend upon the adequacy of this provision. The management of the associations is commonly much more democratic and truly mutual than that of the regular companies, altho some of them are managed in quite as autocratic a manner. Those which operate on the lodge system are, however, all managed on the representative plan, the members electing delegates to State and national conventions who legislate for the association and elect its managers. (For further information concerning these orders, see FRATERNAL SOCIETIES.)

Marine insurance began in England very early. In the United States, the first record of it is in 1757 in New York City. In 1794 the Insurance Company of North America was organized to do a marine and fire business. Sickness insurance was attempted from 1845 until 1850, but failed of success, there not being sufficient data to work upon. It is now being again undertaken with better prospects. The first accident insurance company was the Travelers, of Hartford, organized in 1863, which has been successful from the start. Live-stock insurance began in Connecticut in 1866. In the same year the Hartford Steam Boiler Insurance Company was organized. In 1872 the Guarantee Company of North America began the business of surety insurance, with headquarters at Montreal. In 1876 the Real Estate Title Insurance and Trust Company, of Philadelphia, was organized. Liability insurance did not become popular until about 1890, and burglary insurance only within the last two or three years. Credit insurance has been widely patronized during the last 10 years.

In some places in Germany a system of employment insurance is said to be in full working order. The recent history of insurance in Europe lies in the development of State and of compulsory insurance; this we study in a section by itself **The Future.** (see p. 740). Insurance some consider the most socialistic form of modern business, since its essence is security for the individual by dividing losses over the community. Undoubtedly the future of insurance is involved with that of socialism. The agitation for old age pensions (*q. v.*) clearly indicates this.

The following are the most recent insurance statistics:

FIRE INSURANCE, JANUARY 1, 1895.

NUMBER OF COMPANIES IN THE UNITED STATES.	Capital.	Assets Exclusive of Premium Notes.	Net Surplus.	Cash Premiums Received during Year.	Total Cash Income during Year.
293 Stock..... } 235 Mutual..... }	\$71,446,660	\$351,072,971	\$108,887,343	\$161,557,830	\$161,557,830

NUMBER OF COMPANIES.	Paid for Losses during Year.	Paid for Dividends during Year.	Expenses other than Losses and Dividends during Year.	Total Disbursements during Year.	Risks Written during Year.
293 Stock..... } 235 Mutual..... }	\$94,646,618	\$12,592,356	\$52,843,860	\$160,251,738	*\$16,000,000,000

* Approximation. With the exception of the estimate of risks written during the year, compiled from "The Insurance Year-Book." They do not include a few stock companies and some 600 mutuals, whose transactions are purely local and of small volume.

LEADING FIRE INSURANCE COMPANIES.

COMPANIES.	Assets.	Capital.	Net Surplus.
Ætna, Connecticut.....	\$10,847,816	\$4,000,000	\$3,197,847
Insurance Company of North America.....	9,562,600	3,000,000	2,244,260
Home, New York.....	9,159,837	3,000,000	1,070,428
Hartford Fire, Connecticut.....	8,645,736	1,250,000	2,422,890
Liverpool, London and Globe.....	8,498,268	*200,000	2,871,180
Royal, England.....	7,609,259	*200,000	1,067,805

* Assessment companies.

† Including assessment business (\$7,482,286,000 insurance in force), on which no part of the future premium is collected in advance.

INSURANCE REFORM.

Richard A. McCurdy, president of the Mutual Life Insurance Company, of New York, says in the *North American Review* :

"Any form of insurance, whether it be purely mutual, proprietary, or fraternal, if not conducted on a paying basis, must necessarily fail. The purely mutual company will drop asunder; stockholders in a proprietary company will wind up the concern or it will go into the hands of a receiver by process of law; enthusiasts who sustain clergy mutual leagues and employees' benefit associations will grow weary in well-doing and try to reinsure their risks or leave them to their fate. Assessment societies come to grief when the assessments are levied too often, and the shores of the ocean of indemnity are strewn with innumerable wrecks of craft, fantastically named and equipped, which have met the common fate of all non-paying enterprises in a commercial age. . . .

"Wise management freed from antiquated precedent and dead tradition; accumulation superimposed upon indemnity; legitimate methods of increasing accumulation systematically employed; adoption of long-deferred periods of repayment or distribution; recognition of the fact that insurance must be conducted on a paying basis, just like any other business that succeeds; in fine, a continuously productive union of the capital of the intelligent policy-holder and the skilled labor of the experienced and successful life underwriter, supported by highly instructed and organized agency forces—these to-day are demonstrating the possibilities of insurance in ways till recently not fully understood, and it is to these that we must look for even greater developments in the future."

This is a business view of insurance promulgated by a business man. Against it may be offset what David Parks Fackler, an eminent actuary, said at the annual meeting of State Insurance Commissioners in 1892 :

"Our life companies are becoming vast financial corporations, and may become a source of danger to the commonwealth by reason of the vast money powers lodged in the hands of a few men—possibly only one man in each company. The assets of great railroad and manufacturing companies are practically all planted, while those of life companies are in marketable securities which can be converted into cash in \$10,000,000 lots and be used to influence legislation or to affect the money market. It is easy to imagine very startling possibilities when our life companies shall have obtained their probable future size."

Thus far, however, this has developed no serious evils. Insurance companies have been the corporations least criticised and perhaps the least open to criticism. They have, however, weakly permitted themselves to be blackmailed by unscrupulous legislatures and politicians, and in New York especially are understood to be very heavy contributors to the corruption funds of the political machine.

The principal criticism is that all kinds of insurance could be furnished at considerably lower rates than at present prevail. It is thought that the proportion of the rates disbursed for expenses is entirely too large. In all branches of insurance, and especially in life insurance, it is conceded that the commissions paid agents have in recent years exceeded all reason. This indictment is most severe against the regular life insurance companies, tho some of the assessment associations are almost equally extravagant. The extreme is reached among the industrial companies, as might be expected, since weekly collections involve a very great amount of work, when the amounts collected are rarely more than 15 cents, and frequently as

low as five. Of course the largest part of this expense could be avoided if people would seek insurance instead of letting it seek them; but even at the extravagant rates of expense under which the business is now conducted, the benefits are so great that hundreds of millions of dollars of industrial insurance are taken every year.

The insurance problem, then, of this day is to secure good, reliable insurance for the poor at a low price. No one needs insurance as do the poor. They seldom save, and often cannot save.

The Real Problem.

When sickness or death enters the family, it costs untold financial anxiety and suffering, from which insurance should protect them. Probably the industrial companies are doing as well as could be expected under the circumstances. It cannot be said that their collectors as a rule are making more than living wages. The managers of the companies have also exhibited unusual liberality in paying, during the recent hard times, a multitude of claims which could have been defeated according to the terms of their policies. They have also voluntarily, of their own motion, admitted industrial policy-holders to the benefits of paid-up insurance, to which also they were not entitled by the terms of their policies.

In the United States, outside of endowment and tontine insurance, which are patronized almost exclusively by the well-to-do, there are no means of providing for old age through the means of insurance. In this respect we are far behind almost all the countries of Europe.

STATE AND COMPULSORY INSURANCE.

In several countries, notably Switzerland and Norway, there are State fire insurance companies competing with the stock companies for business. In England there is a system of government annuities. In New Zealand there is an exceedingly successful governmental life insurance department which does about half the business of that colony, and which now has aggregate assets of more than \$10,000,000. This company also has operated in competition with proprietary and mutual corporations. The State insurance companies, with the exception of the English annuities, have been almost uniformly successful; but it cannot be said that in the majority of cases they have furnished materially cheaper or more reliable insurance than have private corporations.

It is believed that this phenomenon is explained by the fact that they are competitive and not monopolistic institutions. As a result of their competitive nature, they are compelled to incur practically all the expenses that are incurred by stock corporations. Wherever insurance has been made a State monopoly, as is the case in the compulsory insurance of Germany, it has been found that it can be conducted with great economy. Even in Germany working men are permitted to exercise the option of insuring in private companies, but the fact of compulsion operates there to make the State insurance practically monopolistic. The chief though not the only objection to the State insurance system of Germany—a full description of which will be found in a publication by the Depart-

ment of Labor, Washington, D. C.—is that its management is autocratic and paternal instead of democratic and fraternal. At the same time there is no question whatever that the idea of introducing this form of insurance was obtained by Bismarck from the socialists. Concerning this, the publication of the labor department referred to says:

"After the Franco-Prussian war a growth of socialism, between 1871 and 1877, nearly fourfold, startled the government so seriously that active measures were considered for meeting the danger. The famous 'exception law' was passed against the socialists. The severity of the law was extreme. Not only were meetings, clubs, and hundreds of publications at once forbidden, but the measures against them were pitilessly enforced. Leaders were driven out of the country, and apparently the very sources of the party quenched. It was the drastic character of this legislation that made it imperative that something should be done against this peril, of a wholly different nature. . . .

"No bolder or more aggressive attitude was ever taken than that which the chancellor [Bismarck] assumed at this time. He admitted frankly his admiration for Lassalle and his sympathy with many of his aims. He saw, however, in the new socialism a fact of absolutely different character from that for which Lassalle stood. Of more importance, however, is the daring form in which he proposes to take wind from the sails of his enemies. 'The State,' it was said, 'shall be put fearlessly at the disposal of the laboring classes.' Bismarck taunted the socialists with being negative, 'but my program,' said he, 'shall be positive.'

"The positive remedy that he brings is the elaborate scheme of compulsory insurance of the working classes. . . .

"It has been said, 'Two shots at the emperor upon Unter den Linden are responsible for the insurance laws.'"

The idea of Bismarck was to prevent the advance of socialism, but in this he did not recognize that a thing of this sort is tyranny or beneficence, according as it is put on the necks of the people by others or by themselves. Professor E. R. L. Gould, of Johns Hopkins University, thus describes the measures of the German Government:

"The first of these measures was passed June 15, 1883. It was modified in April, 1892, in order to bring it into harmony with the other insurance laws which had in the mean time been passed. Sick insurance is about to be extended to agricultural laborers and to servants. At present nearly eight millions of persons are insured, and expenditures for sick relief amount to more than \$23,800,000 annually. The purpose of sick insurance is to ensure a certain and sufficient relief in case of illness during at least 13 weeks. The employee pays two thirds of the sick insurance and the employer one third.

"Accident insurance is likewise compulsory and universal. The first law was passed July 6, 1884, and dealt chiefly with industrial enterprises. The law of May 28, 1885, extended accident insurance to transportation agencies. A subsequent enactment, bearing the date of March 15, 1886, regulates accident insurance for State officials, military officers and soldiers. A few months later there was a further extension to agriculture and forestry, and it is on the eve of extension to home industry and commerce. Accident insurance is at the cost of employers.

"Invalidity and old age insurance law was enacted June 22, 1889, and subjects to compulsory insurance after 16 years of age all persons working for wages in every branch of trade, apprentices and servants included, managing officials and commercial assistants with regular salaries up to \$476. The old age and invalidity insurance fund is formed by equal contributions from employers and employed, and an imperial subsidy amounting to \$11.00 per annum is granted to every annuity."

The writer says of the operations of the system:

"Public opinion now very generally favors sickness insurance, regards accident insurance with compla-

gency, but is apparently discontented with the old age and invalidity measure. The law seems to be defective, since, according to a reliable private calculation, nearly 40 per cent. have failed to meet their legal obligations to contribute. The official statement reduces this to 16 or 17 per cent. In four years' time 60,000 claims have had to be refused, and this furnishes ground for criticism and disappointment. Playing sick under the insurance laws, which was originally conceived to be a formidable obstacle to contend with, is now less considered, possibly because less resorted to, possibly

also because better means are found for preventing it. It is very natural that the unworthy classes should hasten to exploit so tempting an opportunity, and thus create an alarming showing during the first few years. There is reason to believe, however, that this was but temporary, and that the phenomena will not occur again."

The summary of this insurance in 1892 was as follows :

PERSONS INSURED, RECEIPTS, EXPENSES, ETC.	INSURANCE AGAINST		
	Sickness.	Accidents.	Old Age and Invalidity.
Persons insured.....	7,273,000	18,000,000	11,200,000
Persons relieved.....	2,752,000	210,000	187,800
RECEIPTS :			
Contributions of employers.....	\$7,378,000.00	\$12,852,000.00	\$11,275,250.00
Contributions of employed.....	18,445,000.00		11,275,250.00
Total.....	31,416,000.00	16,184,000.00	25,751,600.00
EXPENDITURES :			
Benefits.....	22,610,000.00	7,735,000.00	5,331,200.00
Administration.....	1,475,600.00	1,761,200.00	1,066,240.00
Total.....	29,512,000.00	12,852,000.00	25,751,600.00
Accumulated funds.....	26,180,000.00	24,038,000.00	38,758,300.00
Benefits per case.....	8.33	44.03	28.56
Charges per person insured.....	3.33 ²	.714	2.142

The report of the Department of Labor referred to says of the system :

"Certain confident claims that were made by the early leaders in this legislation are not only not fulfilled, but there is scarcely a sign that they will be.

"1. In the sense in which Bismarck used the word, there is little likelihood that the laborers will be made contented by the laws.

"2. The hope that certain classes of the insured would the more readily go into the country from the city, or stay away from the city (as their money would go farther in the country), shows no hints of being fulfilled.

"3. That the social democracy has been in the least harmed or checked in its propaganda very few would claim.

"4. Whatever may be true in the future as a result of these laws, the charity burden has not been lightened in any way corresponding to the belief of many advocates of the insurance.

"5. As to the belief entertained by many that the laborer would be led through the influence of these forced contributions to learn the habit of saving, it is quite certain that no such results could as yet be brought forward.

"6. That a better feeling has in consequence been brought about between employer and employed is, upon the whole, questionable, altho this (under many circumstances where the groups are not too large) is affirmed to be true.

"It is fair to reply that most of these disappointments are of little consequence even if true, and also that time will work very great and hopeful changes.

"There are many reasons to believe that much of this faith is justified, not as yet on strictly economic grounds, but upon grounds that are more important.

"There are indications of extreme significance that results of the widest social advantage are to follow this very brave attempt to use all powers, whether of state or individual, to lessen evils which none deny. . . .

"The chief moral effect will be in the increasing sense of solidarity which the very attempt to make the laws succeed will intensify and increase.

"If the laws had eventually to be abandoned, this result would remain. This quicker sense of 'social oneness' is apparent in the press, in public speeches, in university lectures, in countless volumes upon every phase of the so-called social question, as well as in the philosophical and ethical treatises. (See for an example Paulsen's *Ethik*, pp. 787,802, etc.)

"Here is a force far too considerable to be measured by any merely economic estimate.

"In expressing this belief in ultimate results that are essentially extra-economic, it is not forgotten that the

principle of self-help is put by these laws to much risk. It is bad that the free, friendly associations should be made to suffer as they unquestionably are by this form of State competition, but the evidence is overwhelming that society is unwilling to wait for the self-help institutions to deal with social ills."

The disposition is strong to introduce compulsory insurance in other countries, especially in France, where M. Bourgeois, the recent Premier, was the author of a measure for compulsory insurance in that country. In 1888 Australia adopted a system similar to that of Germany and Hungary in 1891.

What might be accomplished in the way of furnishing cheap insurance through the means of compulsion in a democratic State might be imagined by the following statement from the *Insurance World* :

"Mr. Leslie (Assistant Actuary Government Insurance Department of New Zealand) recently published a study of *The Rates of Mortality in New Zealand*, covering the mortality according to the census, which compilation is the best and most practical thing of the sort that has come to our attention. It also shows that a mortality table constructed with great care from the data which the census-takers collected is not merely more favorable than the tables constructed from the census of any other country, but also more favorable than the experience on insured lives in any compilation, except in that of the Australian Mutual Provident Society. Indeed, so low is this experience that it shows that all the male citizens of New Zealand could be insured from age 20 at a net rate of but \$10.96 per \$1000 if compulsory insurance existed, *all being taken without regard to state of health*. Such a favorable opportunity to test the virtues of compulsory insurance by the State will probably not be long neglected, especially as the machinery of State insurance is ready for it. The rate for women would be slightly lower than even these figures."

The cost of administration could not be great, and it is probable that this insurance could be furnished at a total cost of not exceeding \$12 per \$1000 without taking into account the fact that higher rates of interest than 4 per cent., upon which the rate is based, would be for a long time obtained. It must be taken into account also that this compulsory system would furnish to a very large part of the population

whose health condition now prevent their obtaining insurance the protection of which their families stand in need. This beneficent thing would be accomplished not at an increased cost to the healthy and robust, but instead at a diminished cost.

But this is not all. With the introduction of compulsion all necessity for a reserve disappears. The reserve in life insurance is for the purpose of supplying future premiums when the same become less than the cost of insurance. If a compulsory system were adopted, this equalization would be brought about by collecting from each productive member of the community, without regard to age or health conditions, his quota of the aggregate losses. Actuaries agree that this would be entirely practicable on the basis of compulsory insurance, altho entirely impracticable when the young and healthy are free to enter or not, as they choose. The effect of this would be that probably all persons in New Zealand, for instance, could be permanently supplied insurance at a cost not much, if any, exceeding \$12 or \$13 per \$1000. As the New Zealand insurance department already supplies conveniences for monthly and for four weekly payments without adding any considerable sum for the additional expense, there seems to be no reason why this experiment should not be tried by this colony, which is already so far ahead of the rest of the world in socialistic enterprise.

In England nothing has been done up to the present time, and there is little likelihood that anything will be done in the immediate future, tho men of the ability and standing of Secretary Chamberlain, Sir John Gorst, Canon Blackley, Charles Booth, and others, have urged action.

MILES M. DAWSON.

INTEMPERANCE.—For a discussion of the various ways of dealing with the social

problem of intemperance, see HIGH LICENSE ; LOCAL OPTION ; MULCT LAW ; NATIONALIZATION OF THE LIQUOR TRAFFIC ; NORWEGIAN SYSTEM ; PROHIBITION ; SOUTH CAROLINA DISPENSARY SYSTEM. For the history of the temperance movement and the condition in England, see TEMPERANCE. For the extent and political power of the traffic, see LIQUOR TRAFFIC. For a discussion of how far intemperance is the cause of poverty and crime, see POVERTY ; CRIME.

We consider here the statistics of the growth, prevalence, and cost to the community of intemperance, with opinions as to its evil, our statement being abridged from Mr. George B. Waldron's *Prohibition Handbook*, 1896.

I. CONSUMPTION OF LIQUOR.

The *Statistical Abstract of the United States* for 1895 (p. 294) gives the consumption of liquors of all kinds in the United States for a series of years. The table here given contains the figures for the past 20 years. For purposes of comparison the figures are given by decades, from 1876-85 and from 1886-95.

There was little change from the first decade to the second in the per capita consumption of spirits and wine ; but the increase in the use of beer has been very marked, jumping from 8½ galls. per capita on the average in the first decade to 14 galls. in the second, which is a gain of over 60 per cent. In the past four or five years the per capita consumption of beer has been more than twice as great as during the first years of the period.

It may be an aid in comprehending, in a measure, the immense quantity represented in 15,000,000,000 galls. to know that it would fill a canal 20 ft. wide, 10 ft. deep, and 1938 miles long, or of sufficient length to reach from New York to Denver.

ANNUAL CONSUMPTION OF INTOXICANTS, IN THE UNITED STATES FOR THE PAST 20 YEARS.

Distilled liquors are measured by the Government in proof gallons, which indicates that they are 50 per cent. in volume of alcohol. Wines average, say, 12 per cent., and beer 5 per cent. On this basis the people of the United States consumed 93,446,171 galls. of alcohol in 1895, which is 1.34 galls. per capita. In 1894 the consumption of alcohol was 99,641,740 galls., or 1.46 per capita, and in 1893, 108,164,732 galls., or 1.62 galls. of alcohol per capita.

There are no reliable data for the amount of wine and beer used as a medicine and in the arts and manufactures. The census of 1890 makes an estimate of the amount of distilled liquors so used during the calendar year 1889 (see *Census Bulletin* No. 22), as follows : Alcohol, 6,745,152 proof galls.; Cologne spirits, 1,453,048 galls.; high wines, 75,992 galls.; whisky, 2,023,000; brandy, 266,874; rum, 189,581;

gin, 222,295 : total, 10,976,842 galls. This is 12.5 per cent. of the 87,829,562 galls. of spirits consumed during the fiscal year ending June 30, 1890.

BEER PRODUCT OF THE WORLD IN 1894.

The tables which follow, showing the world's production of beer for 1894, are prepared from statistics gathered and published by *Gambrius*, a beer organ of Vienna, Austria. What it means, that nearly 5½ thousand million galls. of beer were demanded during the year for the world's consumption, is beyond the power of the mind to conceive. At the average retail rate of not less than 50 cents a gall., to quench its beer thirst the world expended 2739 millions of dollars in a single year, a rate of expenditure sufficient in less than 18 months to purchase every ounce of the world's great stock of gold.

II. THE COST OF INTEMPERANCE.

The retail cost of the drink traffic was made the subject of a very careful investigation by Mr. F. N. Barrett, editor of *The American Grocer*, of New York City, for the Treasury Department, in 1887. Mr. Barrett's methods were given so fully that we have followed them

substantially in the estimate for 1895 in the table which follows. Mr. Barrett's figures for 1887 were practically the same as those of Mr. Edward Atkinson, the Boston statistician, for the same year. The figures for the consumption of liquors, which form the basis of the estimate, are taken from *The Statistical Abstract for 1895* (page 294) :

ESTIMATED RETAIL COST OF THE TRAFFIC—YEAR ENDING JUNE 30, 1895.

KINDS OF LIQUOR.	Gallons Consumed.	ESTIMATED RETAIL COST.			Internal Revenue and Customs.
		Per Gallon.	Total.	Per Capita.	
Distilled, domestic.....	†76,331,701	\$5.00	\$381,658,505	\$5.47	\$79,862,627
Distilled, imported.....	1,496,860	8 00	11,974,880	.17	2,594,366
Fermented, domestic.....	1,040,259,039	*.50	520,129,520	7.40	31,049,618
Fermented, imported.....	3,033,867	*1.00	3,033,067	.04	637,512
Wines, domestic.....	16,580,657	*2.00	33,179,314	.48
Wines, imported.....	3,054,392	*4.00	12,217,568	.17	3,697,826
Total.....	1,140,764,716	\$962,192,854	\$13.79	\$118,432,949

* Estimates of Mr. F. N. Barrett, editor of *The American Grocer*.
 † We estimate that 12½ per cent. of this is used in the arts, manufactures, and sciences, but this is fully compensated for in the water added when sold at retail.

DIRECT AND INDIRECT LOSS FROM THE DRINK TRAFFIC.

The nation's liquor bill for 1890..	\$902,645,867
Government revenues from liquor:	
Internal revenues.....	\$107,695,910
Customs.....	8,518,081
State and local revenues.....	241,786,496
Total Government receipts	\$141,000,487
Expenses of collecting (2.65 per cent.).....	3,736,513
Net Government revenues from liquor.....	137,263,974
Net direct cost of liquor traffic..	\$765,381,893
Indirect cost of liquor traffic:	
Loss of work by 3,750,000 hard drinkers.....	\$132,750,000
Loss of work by non-drinkers.....	66,275,000
Loss from deaths of 45,000 drunkards.....	116,289,000
Cost to Government of poverty and crime.....	68,881,110
Private cost of poverty and crime.....	68,881,110
Total indirect cost of traffic..	453,076,220
Total cost of liquor traffic...	\$1,218,458,113

How much loss is occasioned by the poverty and crime due to drink? \$91,841,480 is spent by the State and local governments for the courts, police, jails, poor-houses, and other methods of caring for the criminals and paupers. Of this it is safe to estimate that at least 75 per cent. is due to drink, making a loss from this source of \$68,881,110. But this is only the cost to the State or local governments and does not include the private losses due to these causes. These we estimate at as much more—another \$68,881,110, making \$137,762,220 for poverty and crime.

A reference to the table shows that the total indirect cost of the traffic from these sources is \$453,076,220, which, added to the \$765,381,893 of direct cost, makes an aggregate of \$1,218,458,113 of direct and indirect cost of the traffic.

III. EVIL EFFECTS OF INTEMPERANCE.

(a) POVERTY.

The twenty-third annual report (1893) of the Massachusetts Bureau of Statistics of Labor contains a special investigation into the condition of the tenement population of Boston. One of the inquiries made was as to why the tenants of the poorer houses remain in undesirable conditions. The investigation covered 475 families and 2140 persons residing in tenements, or neighborhoods classed as poor or bad. The principal cause was in each case selected, although in some cases more than one cause was found. The following table shows, as the results of the inquiry, that more than 42 per cent. of these people live in bad tenements primarily because of intemperance :

CAUSES FOR REMAINING IN POOR TENEMENTS.

CAUSES.	Number of Families.	Population.	PERCENTAGE.	
			Families.	Population.
Intemperance.....	205	912	43.16	42.62
Low rent.....	74	290	15.58	13.55
Poverty.....	22	103	4.63	4.81
Choice.....	53	240	11.16	11.22
Necessity.....	117	572	24.63	26.73
Nearness to work....	4	23	0.84	1.07
Total.....	475	2,140	100.00	100.00

(b) CRIME.

A careful investigation into the relation of drink to crime was made by Carroll D. Wright, now United States Commissioner of Labor, when he was in charge of the Massachusetts Bu-

reau of Labor. He analyzed the crimes committed in Suffolk County, which contains the city of Boston, for the year ending September 1, 1880. The total number of sentences passed during the year was 16,897, of which 12,289, or 72 per cent., were for offenses clearly due to drink, 12,221 being for drunkenness and 68 for illegal sales of liquor. Of the remaining 4608 persons convicted of various crimes, Mr. Wright found that 2097 had committed them while under the influence of liquor, and that the intent to commit the crime was formed by 1918 while under the influence of liquor. It was found in 1804 cases that the crime was committed under conditions induced by the drinking habits of criminals, while in 821 cases the drinking habits of others induced the crime condition.

If the 2097, who were shown to have committed their offenses while under the influence of drink, be added to the 12,289 convicted of "distinctively rum offenses," this makes 14,386 out of the total 16,897 commitments, or 84 per cent., due to drink particularly.

Professor J. J. McCook, of Trinity College, Hartford, Conn., in a paper read before the Twentieth Century Club, of that city, in 1895, speaks of the relation of drink to crime in these words:

"For 12 years the police arrests for drunkenness alone averaged in Hartford 62.8 per cent. of the whole number, while drunkenness and its allied offenses numbered 80.6 per cent. This proportion is perhaps somewhat larger than in most places, but it may generally be expected to be at least as high as three fifths. "95 to 97 out of every hundred incarcerated in our jail are self-confessed drinkers, altho they pleasantly add 'moderate' to the title; and from 43.6 to 56.1 per cent. of them are there specifically for drunkenness, and fully 66 per cent, or two thirds of them, are there for that and its resulting crimes. There were 1303 of them there last year out of a total of 2111.

"Of the 381 captives in our State prison last year, 46.8, or almost half, thought drink had done it.

"Take special phases of crime, for example:

"Abuse, neglect, or abandonment of children. Those most familiar with the subject in this neighborhood have put the proportion of cases attributable to drink at or beyond two thirds. From the Pennsylvania Society to Protect Children from Cruelty, with headquarters in Philadelphia, a former vice-president, in talking with me, fixed the proportion roughly at four fifths to nine tenths. But the secretary gives me definite statistics for 1891-92, showing 309 cases of drink out of a total of 864 in 1891, and 359 out of 987 in 1892, i. e., from 35.8 per cent. to 36.4 per cent. In some previous years the percentage had been as high as 50.

"Take murder and homicide. During the months of January, February, and March of last year I clipped from three daily papers here every case of murder and homicide and classified them according to assigned causes. In a very large proportion no cause was given. All such were reckoned as not due to drink—which is, of course, conceding far too much—and drink was charged only when definitely assigned. In January there were 31 cases, of which 9 were due to drink; in February there were 67, of which 10 to drink; in March, 41, of which 10 to drink. The total was 119, with 29 cases, or 20.9 per cent., specifically attributed to drink."

The railroads of the country recognize the importance of having sober men. *The Voice* has recently collected information from leading officials of 45 railroads, having some 200,000 employees, or about one fourth of the total number employed in the country. Without exception all agree that, from their business experience, "habitual drinking makes employees less efficient in their work." In reply to the question, "Does your company forbid the use of intoxicants to employees while on duty?" all,

without a single exception, reply that they do. The class of service upon which this requirement is usually made is the train service, but many require this of all employees.

OTHER OPINIONS.

"For myself, 21 years of study and observation have convinced me that poverty is a prime cause of intemperance, and that misery is the mother and hereditary appetite the father of the drink hallucination.

"To the labor reformers I have to say, you have united for home protection; so have we. You will bring it about by standing together at the ballot-box; so shall we. In the slums they drink to forget; we would make life something they would gladly remember. We once said intemperance was the cause of poverty; now we have completed the circle of truth by saying poverty causes intemperance, and that the underpaid, underfed, undersheltered wage-earning teetotaler deserves a thousand times more credit than the teetotaler who is well paid, well fed, and well cared for. Our objects are the same. Let us clasp hands in the unity of the spirit and the bond of peace.

"Ten years ago I could not have said it honestly, five years ago I could not have said it helpfully, but now I fearlessly declare that I believe it to be the right and duty of white ribbon women to help abolish poverty in the largest sense of that great phrase; but I must in the same breath ask our friends of the labor movement to recognize that our special work for the abolition of poverty consists in the abolition of the public-house and the saloon."—*Frances E. Willard, in her presidential address before the World's W. C. T. U., in London, June, 1895.*

"Of drink in all its combinations, adding to every trouble, undermining every effort after good, destroying the home and cursing the young lives of the children, the stories tell enough. It does not stand as apparent chief cause in as many cases (of pauperism) as sickness or old age, but if it were not for drink, sickness and old age could be better met. Drink must therefore be accounted the most prolific of all the causes, and it is the least necessary."—*Charles Booth, in his book on Pauperism and the Endowment of Old Age (pp. 140, 141).*

"The destruction of the poor is their poverty,' and the present licensing system is a chief cause of the present time poverty, debasement, and weakness of the poor."—*John Burns, M.P., and 130 other British labor leaders, in an address supporting the Veto bill in 1893.*

"If I could I would inaugurate a strike that would drive the liquor traffic from the face of the earth."—*P. M. Arthur, Chief of the Brotherhood of Locomotive Engineers, in a speech at Cleveland, O., March 28, 1886.*

"The liquor traffic is responsible for nine tenths of the misery among the working classes, and the abolition of that traffic would be the greatest blessing which could come to them."—*T. V. Powderly, ex-General Master Workman of the Knights of Labor.*

"I am perfectly well aware that here and there in any country there can be found dens and hovels in which men and families devoted to industrial pursuits find what they call their homes. I have seen such. I can find them in my own State, and probably in every State in the Union. I can find them in England, and in every continental country, but they are the exceptions. In Manchester, England, 60 years ago, 60,000 factory operatives were living underground in cellars. To-day you cannot find one family belonging to the industrial classes living in such a hole. I have looked into a thousand homes of the working people of Europe; I do not know how many in this country. I have tried to find the best and the worst; and while, as I say, I am aware that the worst exists, and as bad as under any system or as bad as in any age, I have never had to look beyond the inmates to find the cause; and in every case, so far as my own observation goes, drunkenness was at the bottom of the misery, and not the industrial system or the industrial conditions surrounding the men and their families."—*United States Commissioner Carroll D. Wright, in an address on The Relation of the Modern System of Industry to Intellectual Development (1895).*

"If I could have my way I would wipe out every saloon. The saloon is the prolific source of nine tenths of the misery, wretchedness, and crime, and is, more than we know, responsible for the social evil."—*Rev. Charles H. Parkhurst, D.D., in an interview in The Voice of January 16, 1896.*

"After all, if we hunt vice and crime back to their lairs we will be pretty sure to find them in the gin-mill. Drunkenness is the prolific mother of most of the evil-doing. . . . Drunkenness is the prime cause of all the trouble."—*Thomas Bynes, while Superintendent of the New York Police Department.*

For views and statistics contrary to this opinion that intemperance is the main cause of poverty, see POVERTY.

(c) PHYSICAL EFFECTS.

In the annual report of the Registrar-General for England and Wales for the year 1893, it is stated that "the deaths directly ascribed to intemperance numbered 2174, or 73 per 1,000,000, which is the highest rate on record; the rates in the three preceding years had been 70, 71, and 67 per 1,000,000." The deaths reported due to intemperance have reference only to those acute forms of alcoholism in which the death could be immediately traced to intemperance. Since 1869 the death-rate from this cause has more than doubled, being 34 per 1,000,000 in 1869, 29 in 1870, and 32 in 1871.

In the *Proceedings of the Royal Society of Victoria*, published in Melbourne, January, 1894, is a paper on *The Damage Done to Members of the Medical Profession by the Abuse of Alcohol*. The writer has traced the careers of the members of three classes graduating at Melbourne University. Of 56 Bachelors of Medicine in the Class of 1881-82, 12, or 21 per cent., are known to have become victims to an "excessive use of alcohol." Of 86 in the Class of 1883-84, 10, or 12 per cent., have become victims. Of 106 in the Class of 1885-86, 12, or 11 per cent., have become victims.

The French Academy of Medicine, one of the most illustrious scientific bodies in the world, near the close of 1895 adopted the following resolutions proposed by MM. Bergeron and Labordi:

- "The French Academy of Medicine, believing—
- "That the rapid increase in the amount of intoxication due to the manufactured alcohols and the essences and liquors which they help to compose,
- "And that the artificial 'bouquets,' oils of wine, aldehydes, and all compositions intended for the artificial manufacture of wines and liquors,
- "Cause a permanent danger to public health, and create, both directly and by way of heredity, impulsive and criminal insanity, and physical and mental degeneration of the individual and of the race;
- "That they constantly attack the very life and force of the country, and greatly contribute to its depopulation and decadence;
- "Believing, therefore,
- "That it is urgently necessary in the interest of human and national honor to avert as far as possible this danger, and the evil, already rooted, which it produces;
- "Believing, on the other hand, that science has demonstrated, both by experimental study and by chemical observation, that the most impure and poisonous alcohols, whatever may be their composition and source, can be converted into the purest and least poisonous alcohol, which is none the less always and fundamentally a poison;
- "Therefore, be it resolved,
- "That the absolute rectification of all alcohol should be assured by law; . . . and that all products and compositions intended in behalf of the manufacture of artificial wines and liquors . . . should be the objects of absolutely prohibitive legislation; and that these fundamental measures should be aided by others, such as the lessening of the opportunity and temptation, by limiting the number of licenses. . . ."

Beer-drinking Germany, too, is beginning to see that her favorite beverage is not so harmless

as certain American advocates are fond of declaring. The *Deutsche Versicherung-Zeitung*, of Berlin, an insurance journal, published a lecture delivered March 28, 1894, by Dr. Brendel before the Anthropological Society of Munich, in which he said:

"Alcohol, which apparently brings so much pleasure to its partaker, acts as poison, if even consumed in small doses daily, by means of its cumulative action, as strikingly shown here in Munich, the center of beer consumption, by the frequent sudden cases of death of apparently healthy men. Fatty, enfeebled hearts, shriveled kidneys, fatty or hardened livers, changes in the texture of blood-vessels, which cause paralytic strokes and softenings of the brain, by bursting in the brain, chronic catarrhs of the stomach and bronchial tubes, etc., trembling of the limbs, aberrations and diseases of the mental faculties, delirium tremens, etc.—these are some of the consequences of an immoderate drinking of alcoholic stimulants. Professor Dr. Bollinger of this city (Munich) has in the same manner proved the prevalence of various diseases of a definite nature of the internal organs caused by the universal drinking of beer. A normal heart or kidney is the exception only here in Munich. This state of affairs also injures the progeny in a most serious manner. Dr. Demme found that of the children of non-drinkers, 82 per cent. were sound, while of those of drinkers only 17 per cent. were sound. Germany spends at present 2,500,000,000 marks annually for alcoholic beverages! [About \$600,000,000; population about 50,000,000.—*Editor.*] Altogether large quantities of beverages were drunk formerly, still only in the last century, and more especially only in the last decades, in which the brewer's art was perfected, drinking has become universal. It has spread everywhere and increased to a frightful, most alarming extent. It has been introduced even into country communities, and the only inevitable consequence will be the thorough degeneration of the human race, if the evil is not checked before it is too late. Altho it is contended that beer contains less alcohol than either wine or whiskey, it is nevertheless as injurious as either of them, while its vaunted nutritive value stands in no proportion to its price. When a man is required to perform the greatest feats of corporeal exertions, in battle, sport, explorations, etc., the baleful effect of alcohol is most strikingly shown. English life insurance companies divide their risks into two classes, the non-drinkers and the drinkers, and the average of expected mortality has for several years been only 71 per cent. for the former, therefore 29 per cent. less than that of the latter. Taking the rate of mortality at 10,000 of this unit die: Farmers, 630; brewers, 1361; saloon-keepers, 1521; waiters (of both sexes) in barrooms and saloons, 2205. In spite of the marvelous advantages of our present age, a great retrogression, in an ethical sense, is undeniable, the chief cause of which is principally due to the increase of drunkenness, because the beer saloon has become the center and focus of social life."

Reference: See TEMPERANCE.

INTEREST, as the word is popularly used, may be defined as the price paid for the use of money. In exacter thought it is the price paid for the use of *capital* (money or any other form of capital). It is identical with the original meaning of the word *usury*, which, according to all lexicographers, originally meant not, as now, exorbitant interest, but any interest at all, usury being what was paid for *using* money. When the Old Testament forbids *usury*, it is *interest* that is forbidden—taking any pay for the use of money. But this raises a question we shall not here discuss. (For a discussion of the rightfulness or wrongfulness of taking interest and for a history of that question in ethics, see **USURY**.) We here ask simply what part does interest play in modern economic relations; what are the laws which govern it, and how may they be used for the social good?

Here we must, however, sharply notice several important distinctions. The capitalist who in-

vests money to-day usually gets more than mere payment for the use of his money. Why this is so it is easy to see by considering the case first not of a lender of money, but of a corporation or company in business to make money. To do this at the start, it often, perhaps usually, has to borrow money. It does this, hoping out of its business to pay not only for the use of the money borrowed, but also to clear some profits for itself. If it were not for this hope it would not borrow the money or go into business. It can thus be seen that interest or what it pays for the use of borrowed money and profits for itself are two distinct things. Interest may be and often is at 6 per cent., when profits are at 12 or more. It is, of course, often true that in a business there may not be for a long time, and possibly may never be, any profits. The business may be run simply paying rent, wages, and interest; but this is only done for a while, because it is hoped that eventually profits will accrue. Thus having seen the distinction between profits and interest in the case of a business corporation, we can now see that they are still distinct even when paid to the same person. A corporation or individual may have money enough to furnish their own capital without borrowing. They, in this case, may be said to borrow of themselves. They expect, therefore, not only profits, but interest on the money they put in. They expect this because capital, under competition, can always command some interest (whatever the market rate is), and they go into business only because they expect to get something more than the mere rate paid for the use of money; they expect to get some profit out of their especial venture or undertaking. Interest and profits (*q.v.*) are thus distinct.

We must now see another distinction. Some trades are more risky and uncertain and perhaps more dangerous than others. Those who invest money in such pursuits, therefore, demand and can get extra pay for running an unusual risk. They can get this, for otherwise they would prefer to put their money in safer ventures. Hence besides ordinary interest or payment for the use of money, they get extraordinary interest or payment for their risk. Hence such interest is really made up of two elements: (1) payment for the use of money—interest proper; and (2) indemnity for risk. Thus, a corporation or individual has to pay, besides wages, and rent, and interest proper on its capital, an indemnity for its risks and profits or dividends (if it has stockholders) on its business. In economic thought the general word *interest* is generally used to cover the indemnity for extra risks, and the expression *interest proper* is used for interest in its narrower sense of the ordinary payment for the use of money. We shall so use the terms in this article.

We come now to ask what are the laws which govern interest? Interest, under competition, is governed, in the first place, by the law of supply and demand. When there is much loanable capital, interest falls; where there is much demand for capital, interest rises.

Says Professor Marshall (*Economics of Industry*):

"Combining the laws of supply and demand we

get the law of the normal rate of interest, which is: When the economic conditions of a country have been nearly uniform for a long period of time, the supply of capital is such that the rate of interest which can be obtained for it is that which has been required to cause this supply to be forthcoming; and the rate thus determined is the normal rate. The rate is in equilibrium when it is just that at which the whole supply of capital can find employment."

Laws of Interest.

From this general statement many minor truths follow. First, interest (including in it payment for risk) varies with the risk of losing the capital invested. Where this risk is at all serious, interest grows very high. Unstable governments like Turkey or Egypt, or "shaky concerns" or doubtful parties pay sometimes enormous rates of interest. The poor always have to pay higher risks than the rich. Four or 5 per cent. a month (48 and 60 per cent. a year) are not uncommon rates in pawnbrokers' shops. Forty dollars are not unfrequently paid by the poor in a few months for a first loan of \$20 or less. Second, interest varies with the length of time for which the capital is borrowed. People want proportionate compensation for the trouble of frequent transference of capital and their risk of being unable to replace at once. Money on short-time loans will be often three times long-time rates. Here again the poor, who borrow to meet immediate necessities, are often at great disadvantage. Third, interest tends to an equality in different trades.

Says Professor Jevons, in his *Primer of Political Economy*:

"The most important fact about interest is that it is the same in one business as in another. The rates of profit differ very much, it is true, but this is because the labor of superintendence is different, or because there is greater risk in one trade than another. But the true interest is the same, because capital, being lent in the form of money, can be lent to one trade just as easily as to another. There is nothing in circulating capital which fits it for one trade more than another; accordingly it will be lent to that trade which offers ever so little more interest than other trades. Thus there is a constant tendency to the equality of interest in all branches of industry."

Fourth, interest tends to obey the so-called law of diminishing returns (*q.v.*). As civilization advances, the price for the use of money falls, for various reasons: (a) Because stability and confidence, as a rule, increase, and less and less of the element of payment for risk enters into the payment for money; (b) because as society grows wealthy the supply of capital increases in proportion to the demand—how this is modified we shall see later; (c) because capital applied to land already well cultivated causes in general a less than proportionate increase in the return, or, as we may say, it will obtain a diminishing return. This last element is called by some economists exclusively the law of diminishing return (*q.v.*). How all these laws are modified by the advance of civilization in opening up new channels for the employment of capital we shall in a moment see. But it is necessary to note this law, for it is made much of by writers like Edward Atkinson, who assert that capital is always getting a less and less portion in distribution, and labor always more and more.

It is true of interest as the price paid for the use of capital; it is only partially true of the

whole share of capital. The latter, as we have seen, includes interest proper and profit or dividends. Now, interest proper may decrease and yet dividends increase. A fall in the current rate of interest, says G. Bernard Shaw, indicates rather "a tendency of the real interest or share of capital to increase. Current rates of interest we all know tend to fall with increase of population; yet at the same time the market value of established stock rises with increasing population, rises, therefore, as the current rates fall. The current rate," he says, "must, under present conditions, eventually fall to zero, and even become 'negative.' By that time shares which now bring in a dividend of 100 per cent. may very possibly bring in 200 or more."

Capital, by being invested in established stocks, may thus be getting larger dividends, altho the popular rate of interest be falling. Again, tho the *rate of both* dividends and popular interest be falling, the return to the wealth of a few individuals may be steadily gaining, because the amount of the principal on which they draw grows rapidly. Two per cent. on \$1,000,000 is better than 10 per cent. on \$1000. While millionaires are, as at present, yearly adding millions to their principal, it is small comfort to the poor to be shown by Mr. Atkinson that the *rate of interest or even of dividends may be slightly falling.*

Coming now to ask what are the present rates of interest, Professor Jevons, writing in 1878, says (*Primer of Political Economy*):

"The rates of interest actually paid in business vary very much, from 1 or 2 per cent. up to 50 per cent. or more. When the rate is above 5 or 6 per cent., it will be to some extent not true interest, but compensation for the risk of losing the capital altogether. To learn the true average rate of interest, we must inquire what is paid for money lent to those who are sure to pay it back, and who give property in pledge, so that there may be no doubt about the matter. It seems probable that the true average rate of interest in England is at present about 4 per cent., but it varies in different countries, being lower in England and Holland than anywhere else."

Says Professor Marshall more recently (*Economics of Industry*):

"The normal rate of interest in England does not seem likely to deviate much from 4 per cent. for some time to come; but it may be slowly altered by changes in the field of employment, while the market rate of interest is oscillating rapidly up and down on either side of the normal rate as a center. . . . A rate of 8 per cent. on sound investments has spread like a wave, steadily over the greater part of the North American continent; and this is being followed by waves of 7 and of 6 and even 5 per cent. interest that have already started on their way westward and southward from the Northern Atlantic States."

Concerning the future, he says:

"It is difficult to forecast the distant future of the rate of interest. Hitherto the progress of civilization has increased the willingness to save at a low rate. In old countries, in which men are accustomed to work patiently for small gains and to value highly the possession of a secure income, a low rate of interest seems to have little effect in checking the accumulation of capital. In England, for instance, in spite of the low rate of interest, the capital of the country is increasing at the average rate of about £200,000,000 annually; that is, by a little more than a thirtieth of its total amount. If this rate of increase were sustained for 400 years, the capital owned by Englishmen would be multiplied a millionfold, and in 800 years a billionfold. But however high the hopes we may have of the future progress of the arts of production, we cannot suppose that there will ever be a field for the profitable employment of as much capital as this. Sooner or

later the rapid growth of capital must increase the competition of capital for the aid of labor, and diminish the competition of labor for the aid of capital."

Professor Marshall therefore concludes that the share that capital may draw from production will probably tend to be less, and so interest falls. He thinks, however, that it will not fall rapidly to a minimum, but fall slowly, and the rate of fall become slower and slower as it approaches the minimum. A recent illustration in the United States of the lowering of interest is the refunding in February, 1897, of some forty odd millions of maturing 7 per cent. bonds of the Lake Shore Railway in a 3½ per cent. 100-year gold issue limited to \$50,000,000.

But it must not be thought that the problem of interest will be removed from the world while wealth goes on amassing, as it has in England and New York City for examples, with the consequent increasing returns to the fortunate few in spite of falling interest.

Indeed, the fall of interest accompanied by the amassing of wealth rather intensifies many of the problems involved in interest, because when the rate of interest is low, it takes a very large capital to produce the income demanded by many modern families. Hence there results an increasing dissatisfaction with small capital and a more feverish and intenser struggle to earn, and perhaps quite as likely to inherit or by fortunate speculation to acquire large fortunes. This very dissatisfaction tends to induce a willingness on the one hand to run large risks and deal in speculative interests, which makes interest a little higher, and also tends to create a demand for socialistic and other reforms, which again tends to raise interest by making investments insecure and profits uncertain. Only very large capitals and strong houses and corporations can stand hard times and low rates of interest. Thus in the question of the future of interest is involved the whole social movement.

All we can do is to note the laws which at present govern the rate of interest. Besides those above noted, or, rather, as special applications of those laws, we may see that every invention or discovery tends, for a while at least, to raise interest because it creates a new demand for capital to put the invention in operation. It may, however, eventually lower interest because it may enable men to produce with much less expensive plant. The general tendency of invention, however, has been to cheapen production by increasing the cost and extent of plant to enable the producer to very much increase the volume of his product, and so make greater profits by selling at lower rates. The invention of steam transportation has cheapened products, but has enormously increased the demand for capital. Density of population, too, tends to increase the opportunity to use capital. So, too, does the raising of the standard of living. Marshall points out that when a community begins to outgrow its primitive cheap buildings and demands expensive buildings, the demand for capital rises, and with it the rate of interest. One other factor and a general conclusion Marshall states in these words:

Other Factors.

"There is also the demand for the loan of wealth by persons or States who do not intend to use it productively, but who mortgage their future incomes to enable them to increase their expenditure in the present. This part also of the demand for capital will be the greater the lower the rate of interest at which loans can be obtained.

"We see then that the demand for capital depends on the numbers of the population, the natural resources of the country, the scope that the arts of production afford for the employment of auxiliary capital, and the needs of unproductive consumers."

PROPOSED REFORMS.

Such being the main laws which govern interest, we come now to ask how they may be used for the social 'good. The advantage of low interest to a community is apparent. It may indeed be abused by persons borrowing when they would do better not to borrow; but this is a matter of education, and is overbalanced by the stimulus which low interest gives to production, the employment of labor, and the development of natural resources, with all the accompanying advantages. Therefore many schemes have been proposed looking to the lowering of interest. The oldest and seemingly the simplest of these is for government to enact laws forbidding interest above a fixed rate. This was in the Middle Ages, and until recent times the universal custom, due in part to the medieval belief that interest was wrong (see *USURY*); and in part to a paternal theory of government, according to which the State should aid the poor. To-day few believe in this method. It is seen that practically its only effect is to *raise* and not lower the price. We quote on this point a classical passage from J. S. Mill (*Political Economy*, Book V., chap. x., § 2):

"It is, however, a misapprehension of the causes which influence commercial transactions to suppose that the rate of interest is really made lower by law than it would be made by the spontaneous play of supply and demand. If the competition of borrowers left unrestrained would raise the rate of interest to 6 per cent., this proves that at 5 there would be a greater demand for loans than there is capital in the market to supply. If the law in these circumstances permits no interest beyond 5 per cent., there will be some lenders who, not choosing to disobey the law, and not being in a condition to employ their capital otherwise, will content themselves with the legal rate; but others, finding that in a season of pressing demand more may be made of their capital by other means than they are permitted to make by lending it, will not lend it at all; and the loanable capital, already too small for the demand, will be still further diminished. Of the disappointed candidates there will be many at such periods who must have their necessities supplied at any price, and these will readily find a third section of lenders, who will not be averse to join in a violation of the law, either by circuitous transactions partaking of the nature of fraud, or by relying on the honor of the borrower. The extra expense of the roundabout mode of proceeding, and an equivalent for the risk of non-payment and of legal penalties, must be paid by the borrower, over and above the extra interest which would have been required of him by the general state of the market. The laws which were intended to lower the price paid by him for pecuniary accommodation end thus in greatly increasing it. These laws have also a directly demoralizing tendency.

"Such restriction, altho approved by Adam Smith, has been condemned by all enlightened persons since the triumphant onslaught made upon it by Bentham in his *Letters on Usury*, which may still be referred to as the best extant writing on the subject."

Another popular method for lowering the rate of interest, agitated in the United States since the war, has been the issue of paper currency by the Government or by some means the in-

creasing of the currency of the country, thus aiming to increase the amount of capital to be loaned, and thus to lower interest. But the wisdom or unwisdom of this depends wholly on how it is done, and so we consider it under *EXPANSION AND CONTRACTION OF CURRENCY*. It should be noted here simply that if the rate of interest depend on confidence, as we have stated above, no amount of increase of currency will lower interest, if the currency be depreciated or break public confidence. This is the danger of that plan. If this could be avoided, and it seemed advisable for other reasons, it would doubtless lower interest.

A third popular method for lowering interest, and one recently much agitated, is for the Government to make loans to people directly on security of any form of property. It is said that if the Government makes loans to the bankers to furnish the banking system of this country, and out of this the bankers make large profit by reloading the money sometimes at high interest, there is no reason why the Government should not do the same by all classes, instead of compelling all others to go to this one favored class of money brokers whenever they need to borrow. There have been various plans proposed for governmental loans, usually at 2 per cent. The agricultural class has been especially active in urging such plans, and especially the so-called sub-treasury plan (*q.v.*), by which Government should lend at 2 per cent. on agricultural produce brought to appointed Government elevators or storehouses. This is by no means a merely popular and unscientific scheme. At the meeting of the American Economic Association, August 23-26, 1892, Professor Commons said (*Report of Proceedings*, p. 70):

"That seems to me the most scientific plan put forward by any writer or thinker. . . . The sub-treasury will give an elastic currency. I do not want to favor a scheme like this on my own responsibility; but the fact is that this very scheme is in operation, and has been for about six years in Russia. It is not a new thing even in this country. In colonial times Maryland and Virginia had a sub-treasury plan. They had warehouses where tobacco could be stored, and the farmer was given a certificate, which was legal tender throughout the colonies. It circulated as money, but it did not represent the faith of the Government; it represented goods which were stored—just what the farmer wants to-day."

Perhaps the only obstacle to the plan is one of administration, and the question why the same plan should not be applied to all commodities as well as agricultural, and therefore, when it comes to that, if there cannot be a different scheme of governmental socialism, whereby interest shall not be reduced, but practically abolished.

Fearing that this scheme thus directly leads to socialism, most individualists and all conservatives oppose it, and would trust simply to the competition of capitalists to lower interest, a competition which they say has already lowered interest, so that stable governments can now loan money at 3 per cent., and which they say will gradually still lower all interest, if confidence is not upset by sub-treasury paper money and socialistic schemes.

To this it is answered that competition of capital cannot be trusted, because we are having to-day the *combination* of capital. Wherefore some socialists would practically abolish interest

by having all capital owned by the nation or community and individual wealth be obtained only by a system of labor checks. (See SOCIALISM.) A large number of socialists, however, with other social reformers would not favor direct attempts to either reduce or abolish interest, but simply by steadily expanding the sphere of the democratic State in and over industry gradually reduce the sphere of and demand for private capital, and hence steadily reduce interest till it finally fell to nil. The mere nationalization of railroads, it is claimed, would cut off such a large opportunity for the investment of money as to leave no adequate field for the enormous fortunes of to-day, and so compel the rapid decline of interest. Still another class of thinkers (see SINGLE TAXERS) believe that interest may be lowered by freeing land values, and so making the producer less dependent upon the capitalist. (See CAPITAL; USURY, etc.)

INTERNAL REVENUE.—That part of the revenue or income of a country which is derived from duties on articles manufactured or grown at home. In the United States, the principal receipts are now from spirits, tobacco, and fermented liquors. (For early internal revenue laws and for English laws, see EXCISE.)

The Civil War forced a renewal of the internal revenue system, and in 1861 a direct tax of \$20,000,000 was apportioned among the States, tho it was not collected till a year later. On July 1, 1862, an exhaustive internal revenue act was passed, levying taxes on all sorts and kinds of articles too numerous to mention, on trades, incomes, sales, manufactures, legacies, etc., and the people submitted to the necessities of the

case. Extensive reductions were made after the war had ceased, by various acts in 1866, 1867, and 1868. Further reductions were made in 1872, when, among others, stamp taxes, except that of two cents on checks, drafts, and orders were abolished. Various acts since 1872 have reduced the subjects of internal revenue taxation to their present numbers, tobacco, spirits, fermented liquors, bank circulation, and, by act of August 2, 1886, oleomargarine. The following is a table of receipts from internal revenue taxes from 1792-1865, up to 1820 by calendar years, and after that by fiscal years ending June 30.

INTERNAL REVENUE.	
YEAR.	Amount.
1792.....	\$208,942.81
1793.....	337,705.70
1794.....	274,089.62
1795.....	337,755.36
1796.....	475,289.60
1797.....	575,491.45
1798.....	644,357.95
1799.....	779,136.44
1800.....	809,396.55
1801.....	1,048,033.43
1802.....	621,898.89
1803.....	215,179.69
1814.....	1,662,984.82
1815.....	4,678,059.07
1816.....	5,124,708.31
1817.....	2,678,100.77
1818.....	955,270.20
1819.....	229,593.63
1820.....	106,260.53
1863.....	37,640,787.95
1864.....	109,741,136.10
1865.....	209,404,215.25

SUMMARY OF INTERNAL REVENUE RECEIPTS FROM 1865 TO 1895, INCLUSIVE.

FISCAL YEARS.	Spirits.	Tobacco.	Fermented Liquors.	Banks and Bankers.	Penalties, Oleomargarine, etc.	Adhesive Stamps.	Collections Under Repealed Laws.

Aggregate receipts, 1865-95 inclusive, including commissions allowed on sales of adhesive stamps, \$4,842,348,766. Aggregate receipts from all sources in the fiscal year ended June 30, 1895, \$143,246,078.

INTERNATIONAL ARBITRATION.—The following article except for its concluding paragraph is contributed to this encyclopedia by Eleanor L. Lord, abridged from her monograph on the subject published by the American Academy of Political and Social Science.

As it is understood to-day, international arbitration is limited in meaning, implying: (1) the participation of sovereign States of acknowledged independence and autonomy; (2) a formal agreement on the part of the litigants to submit their difficulties to the decision of an arbitrating body or individual; (3) the consent of the latter to undertake such decision and to render an award after a thorough and impartial examination of the facts of the case; (4) an agreement on the part of the contracting parties to accept the decision as final and conclusive.*

Before passing to the application of pacific principles to international relations in the present century, it may be well to review briefly the changes which the last 1900 years have witnessed in the attitude of civilized nations toward war.

The Christian religion, as taught and practised by its founder and His disciples, placed especial emphasis on the principles of brotherly love, forbearance, forgiveness of enemies, and peace and good-will

History. toward all men—theories of life and of human intercourse quite strange to the civilizations of the pre-Christian era. All the records of the early Church which have come down to us of the first two centuries of its existence would seem to show that the inconsistency of warfare with the tenets of the new religion had made a strong impression upon the sect.

It was the Church as an organization that, throughout the Middle Ages, uttered the sole remonstrance against the practice of private war. When, in France, the atrocities of feudal warfare became so great as to threaten the very foundations of society, it was the Church that came to the rescue with the "peace of God;" and five years later, the "truce of God," by which fighting was forbidden from Thursday morning to Monday morning of every week, on all feast days and in Lent, leaving, practically, about 80 days in the year when war was allowable.

During the eleventh and twelfth centuries numerous associations were formed which were the prototypes, on a small scale, of modern peace societies. There was not as yet, however, any conception of international peace—the word international could hardly have had any meaning. By the time that the spirit of nationality had begun to assert itself—*i. e.*, when there had begun to be a distinct differentiation of the several small nations of Europe in respect to language, institutions and political interests, schemes of universal peace and of a united Christian State had become dreams of the past.

Medieval methods of grappling with the war problem ended, then, in practical failure; and the cause of universal peace was forgotten in

the horrors of the Inquisition and the blood-thirsty wars of the Reformation. The conception of Henry IV. of France of a grand Christian republic of 15 States, and his scheme of international arbitration were too far in advance of his time not to have been regarded either as the dreams of a visionary fanatic or as a subtle attempt at the aggrandizement of France. More valuable and far more important was the work of Hugo Grotius, who, while a guest at Henry's court, received the inspiration to his great work, *De Jure Belli ac Pacis*, in which he laid the foundation of a system of international law.

Here it will be observed that the character of the peace movement has changed. It is no longer religious, but political in its aims. Efforts toward reconciliation no longer originate with the Church, but with monarchs and statesmen; they take the form, in general, of alliances of the great powers of Europe for the purpose of preserving peace among themselves, and thus, by the latent strength of unity and numbers, preventing the possibility of attack by ambitious and grasping rivals. Experience shows the delusiveness of such a theory.

The opening of the nineteenth century brought with it a return to the religious point of view, and to the primitive notion that Christianity is the basis of all international law. Europe entered upon the century worn out with conflict and in desperate need of peace. Russia, Austria, and Prussia accordingly, in 1815, formed what is known as the Holy Alliance, agreeing by a sacred compact to respect the great principles of right and justice, and to repress violence—promises which fell far short of fulfillment.

In 1818, at the Conference held at Aix-la-Chapelle, the four nations that had conquered Napoleon, joined later by France, formed themselves into the Great Pentarchy, in the interests of permanent peace. The dangerous principle of intervention was unanimously recognized, and the outcome was the congresses of Troppau, Laybach, and Verona.

The Holy Alliance forms a link between the peace policy of the past and that of the present. The unsatisfactory results of the Grand Alliance dealt the death-blow to the theory of the balance of power as an efficient and practicable system. Henceforth all efforts toward amicable adjustment of international affairs are to be based upon other principles.

The work of the nineteenth century in view of this end takes on three forms:

1. The organization and work of peace conferences and associations for the promotion of arbitration.

2. Legislation favoring arbitration.

3. The practical application of the principle.

Peace societies began to be established early in the century, the first having been organized in New York in 1815. Six months later the London Peace Society was formed. Similar organizations sprang up all over Europe. Their object was to unite all the advocates of peace for concerted action.

Conferences have been held from time to time

* It is this last feature that distinguishes arbitration from mediation, in which adherence to the decision is optional.

at London, Brussels, Geneva, Paris, and elsewhere, for the interchange of sympathy and the discussion of plans.

About 1873, efforts were made to bring the subject of arbitration before the legislative bodies of the different countries. A motion of the late Mr. Henry Richard passed the House of Commons, in 1873, proposing that England should communicate with foreign powers with a view to the improvement of international law and the establishment of a permanent system of arbitration.

Signor Mancini presented a similar resolution to the Italian Parliament in the same year. From time to time petitions and memorials have been presented to the various governments of Europe and the Americas. Work of this character is necessarily slow and cautious, working like leaven, silently, but effectively.

More attractive to the practical observer is the record of actual cases of settlement by arbitration during the present century. Their number is surprising. I have carefully examined the records of 77 cases, and there are a half dozen more of which I have hitherto been unable to find more than a statement of the dates and participants.

The questions which have proved susceptible of arbitration fall under five main heads:

1. Boundary disputes.
2. Unlawful seizure of vessels or other property.
3. Claims for damage by the destruction of life or property.
4. Disputed possession of territory.
5. The interpretation of treaties.

More than one third of the cases have related to claims for damages presented, usually, by one government in behalf of certain of its citizens resident in the country of the offending government. Such questions, altho occasionally of such a character as to lead to heated controversy and menacing dispatches, have been, for the most part, amicably settled to the satisfaction of all parties.

This list does not include the Danubian Commission established in 1856, the Berlin Congress of 1878 (to settle claims of States in the Balkan peninsula), nor the Joint Commission on the Fisheries Question that met at Washington in 1888 and recommended the submission of future disputes on that question to a mixed commission and an umpire.

The most serious obstacle to the introduction of international arbitration as a permanent institution has been the indecision of its advocates as to the method of conducting cases. Hitherto, three methods of arbitration have been employed: First, reference to some trustworthy and disinterested individual. This is the least advisable plan of all, for

Practical Application. it is usually difficult to find a person who will be satisfactory to the litigants and who will be willing to undertake so delicate a task. Moreover, in the case of disputed boundary lines or claims for indemnity, the labor of investigating records would usually be quite beyond the strength of one man.

The second method, adopted in certain cases, is that of settlement by a conference of diplo-

mats representing the governments concerned. Such a body is unwieldy, and necessitates a large expenditure of time and money for preliminary negotiations.

The most popular and successful plan has been the appointment of a mixed commission, small enough to be easily managed, large enough to work rapidly and systematically, unhampered by diplomatic "red tape." Still, such a commission is temporary—unsuited to a scheme of permanent arbitration. The Halifax Fisheries Commission of 1871 illustrates another objection. The question at issue was to be decided by a commission of arbitration. The clause in the Treaty of Washington admitting the possibility that the choice of umpire of the commission be left to the Austrian Minister at London was very annoying to the United States. The suspicion of unfairness and partiality, whether well founded or not, was the cause of considerable irritation. The final award of the commission was a surprise to the world. By Americans it was considered excessive and exorbitant, and many doubted if it were lawfully and honorably due. The United States promptly paid the money; but as a case of arbitration this was, perhaps, the most unsuccessful on record, and greatly shook the public confidence in the efficacy of that method of adjusting differences.

A permanent mixed tribunal would insure impartiality. Such a scheme would imply the abolition of standing armies or a uniform reduction in their numbers. The question has been raised by doubters, How will such a tribunal be able to enforce its decisions if the army is banished? Some have suggested that each nation furnish its quota of soldiers to form a kind of international police. Such an institution, however, would seem an inconsistency, if a tribunal aiming to substitute reason and justice for the sword and bayonet be obliged to use force in the execution of its decrees.

There is, apparently, some confusion in the public mind between an international court and a permanent commission of arbitration. The former should mean a court of international law, and, to be effective, should be composed of the most eminent jurists and statesmen of whom the world can boast, men who know the laws of nations as they now exist, and who are capable of interpreting and codifying those laws. There is urgent need of a complete and precise code of international law. Much dispute and misunderstanding is the consequence of the imperfection of the present code. "The great end of law is not to decide, but to prevent disputes."

A court of international law would find its authority in the majesty of the law, and the moral support of the nations ought to be a sufficient guarantee for the acceptance of its decrees. Any government which refused to abide by the decisions of so august a body would suffer eternal disgrace in the eyes of the world, to say nothing of the material loss of commercial good will. The expense of such a court, shared by the participating nations, would be comparatively light.

When a dispute arose the plaintiff would at once carry the case to this great Court of Appeals, which would investigate the said case on

a purely legal basis. This would take the place of special arbitration, but should any question not susceptible of legal interpretation arise, a commission of arbitration could easily be formed from the panel of the international jury.

Recent events have occasioned a marked spread of interest in international arbitration. In the winter of 1895-96, France, by the nearly unanimous action of its legislative chambers, proposed a permanent treaty of arbitration between that country and the United States; negotiations are now pending between England and the United States for a permanent tribunal for the settlement of issues arising between those two nations; and the International Parliamentary Conference, in which were members from 14 different European parliaments, not only proposed to its respective governments the organization of a permanent tribunal, but formulated a plan for its organization.

INTERNATIONAL, THE.—The International was a society attempting to unite the working classes of all nations in one socialistic organization. As early as 1840 endeavors were made in this direction, when some German refugees in London formed a *Deutscher-Arbeiter Bildungsverein*, later called the Society of the Fraternal Democrats, and aiming to unite all nationalities. The manifesto (*q. v.*), published by Marx and Engels, 1847-48, aided the movement. The coming of some French workmen to the London Exhibition of 1862 led to further exchange of ideas, and on September 28, 1863, in St. Martin's Hall, London, a meeting was held under the presidency of Professor Beesly (*q. v.*) and the International organized.

Englishmen were chosen as president, secretary, and treasurer of the general council; corresponding secretaries were appointed for the affiliated countries, and Marx naturally received the office for Germany.

Beginnings. At first the policy of the International was little defined, and thus, in endeavoring to unite the workers of all countries, it came to stand for various things in the various countries. Even Mazzini for a while joined it, but drew out when it developed the materialistic socialism he opposed. (See MAZZINI.) In England, it meant little more than international trade-unionism, and when English workmen found that on the Continent it meant more they virtually left it. In Germany, it became socialistic. (See GERMANY.) In France and most Latin countries it developed anarchist-communism. In the United States it had little more than a nominal existence. These divergences naturally proved its weakness, but for a while it alarmed all European governments. Marx became its real leader. He wrote an address in which he dwelt upon

“the want prevailing among the working classes, want which had continued undiminished since 1848, tho the propertied classes had become more prosperous. He held it to be incontrovertibly proved that the perfection of machinery, the utilization of science in industry and agriculture, the extension of markets, artificial measures like colonization and emigration, as well as free trade, were all unable to relieve the condition of the laboring population. Asking for a remedy, he found it in cooperative labor developed to national dimensions and promoted by State resources.

But as the land-owning and capitalist classes would be sure to use their political privileges for the defense of their economic monopolies, the working classes must first acquire political power. They possessed one element of strength, that of numbers, but numbers without union were of no avail, and thus it was a paramount duty to combine for mutual defense and offense. ‘Proletariat of all countries,’ ended the address, ‘unite!’”

The European governments began to take alarm. The first congress was to have been held in Brussels, but was not allowed, and another conference was held instead in London. The first real congress was held at Geneva in 1866, 60 delegates being present, and the second at Lausanne, Switzerland, in 1867. The spirit at this congress was more radical, as in the words with which the president closed the congress: “We want no more governments, for governments oppress us by taxes; we want no armies, for armies massacre and murder us; we want no religion, for religion chokes the understanding.”

Bakounin, the Russian apostle of nihilism, joined the International and fought with Marx for the leadership. Marx and his friends desired a revolution to be conducted by the orderly political capture of the State and the use of the State to develop communism. Bakounin desired to plant communism on the ruins of the State. For a while his fiery leadership carried the mass of the members with him, particularly in Italy, France, French Switzerland, and Belgium. Germany favored the Marxist policy, and in 1869 the Social Democratic Party was formed on its lines. In 1870 the congress was to have been held in Paris, but this was prevented by the Franco-German War, a war which the International strenuously denounced. The revolutionary spirit gave birth to the uprising of the Paris Commune (*q. v.*), tho the International was not directly connected with it. Marx found that this anarchist element must be suppressed, and the General Council arranged to have the congress of 1872 held at The Hague, where Bakounin could not easily come, as he was in Switzerland and would have been arrested in passing through either Germany or France. As a result, the Marxist party triumphed at The Hague, and removed the seat of the General Council to New York City to avoid the machinations of Bakounin. The Bakouninists, however, repudiated The Hague congress and held another at Geneva, claiming to represent the true International. The movement thus divided soon came to an end both in Europe and America. For a while the “autonomists,” as the Bakounin faction styled themselves, kept up a fiery agitation, created several uprisings in Southern Europe, and in the Latin countries had the majority of the organization with them. But suppressed by the police, and unable to effect solid organization, especially after the death of Bakounin in 1876, the party died as an organization, its members, however, becoming the modern anarchist-communists of Europe. (See ANARCHISM.)

The Marxist movement has passed into the Social Democratic parties, formed first in Germany and later in even the Latin countries on Marxist lines, the socialist congresses being the

real representatives of the International to-day (See SOCIALISM.)

In the United States, the International was at first, as in England, considered a mere union of organized labor in all countries, and many American trade-unionists joined it, and delegates were sent to some of its European congresses as in 1867 at Basle. Numerous branches were formed in America, but never took root. After the removal of the

United States.

General Council to New York in 1872, the struggle between the anarchists and the socialists re-appeared on the new shores. In 1877 the socialists took the name of the Socialist Labor Party, and left the International practically to the anarchist communists, the trade-union element having abandoned it long before. The socialists, however, did not wholly leave it till after the arrival in this country of John Most in 1882 and the final separation in 1885. Among the anarchist-communists two separate societies developed, the I. W. P. A. (International Working People's Association) and the I. W. A. (International Workman's Association), the latter being less violent and emphasizing education. (See ANARCHISM.) Both organizations have disappeared (see ANARCHISM), but their spirit has produced monuments in this country like the so-called anarchist movement in Chicago and the various gatherings and deeds of anarchists.

INTERNATIONAL STATISTICAL INSTITUTE, THE.—The International Statistical Institute was founded in 1887, and is composed of 150 members interested in statistical work in various countries of the world. Its meetings are held biennially. The President is Sir Rawson W. Rawson, of England, and its Secretary is Signor Luigi Bodio, Director-General of the Royal Statistical Service of Italy, Rome. It publishes at Rome, Italy, a *Bulletin*, which contains valuable papers in Italian, French, German, or English. Six volumes have already been issued.

INTERNATIONAL TYPOGRAPHICAL UNION, THE.—Local unions of printers were formed in the United States at least as early as 1831 and 1834, and probably earlier. A National Convention of Journeymen Printers met in New York December 2, 1850, and effected permanent organization. At the convention the next year, in Baltimore, the name National Typographical Union was chosen. Yearly conventions were held after that, but in 1869 the organization took the present name, the International Typographical Union, to admit Canadian unions. This convention chartered Woman's Typographical Union No. 1, located in New York City. Since then the organization has prospered till it is to-day the oldest and one of the strongest national unions in America. Enrolling to-day some 40,000 members, it claims to have raised wages 40 per cent., and by its dues and benefits to have aided its members still more. According to the report of the Minnesota Bureau of Labor (1891-92), the Interna-

tional Typographical Union received in 1892, \$113,134.49, and spent \$98,384.78. Of this, in round numbers, \$50,000 was for strike and lock-out benefits, \$30,000 for the Childs-Drexel Printers' Home, \$11,000 for burial benefits. The Childs-Drexel Printers' Home is located in Colorado Springs, the nucleus for its establishment being \$5000 given by Messrs. Childs and Drexel. Besides maintaining this, the union has recently established a fund for death benefits. (See TRADE-UNIONS.)

INTERSTATE COMMERCE ACT AND COMMISSION, THE.—The growing sentiment against railroad combinations and railroad discriminations (see RAILROADS) led, in 1887, to the passage of an act, and the creation of a commission by Congress called the Interstate Commerce Act and Commission. The act was passed by the Senate January 14, 1887, by a vote of 45 to 15, by the House January 21, 1887, by a vote of 173 to 41, and was approved by President Cleveland February 4, 1887. The act provides for the appointment of an Interstate Commerce Commission, consisting of five members appointed by the President and confirmed by the Senate. The act applies to common carriers conveying merchandise or passengers between one State, Territory, or the District of Columbia, to another one of those divisions.

"Unjust and unreasonable charges and unjust discrimination are prohibited; the latter is defined to be the demanding from one person of greater compensation than is asked from another for a like service. It is made unlawful to give undue advantage to one person, locality or kind of traffic over another, or to discriminate between connecting lines. The 'long and short haul clause' provides that the rate for a short haul shall not equal nor exceed the rate for a long haul under like conditions, except as the commission may provide or may relieve from the operations of this section. Freights cannot be pooled with connecting lines; schedules of rates, which must be conformed to, are to be made public, and 10 days' notice of any advance must be given. Combinations to prevent continuous carriage are prohibited. Persons suffering by reason of violations of the act may secure damages in the United States courts, or they may complain to the commission, who have power to compel the attendance of persons and the production of papers, and who shall investigate and order reparation or the ceasing of the violation of the act, and the circuit courts of the United States are given power to enforce these orders, subject to an appeal to the Supreme Court in certain instances. Each wilful violation of the act is a misdemeanor punishable by a fine not exceeding \$5000."

It is almost universally admitted to-day that the act is a failure. Says H. T. Newcomb, writing in the *Political Science Quarterly* for June, 1896:

"A careful analysis of the act shows that Congress attempted to provide three remedies, each of which separately and independently had been advocated as a satisfactory solution of the problem of railway rates by persons holding the most divergent views. These remedies were: (a) a summary process for hearing and adjudicating complaints against railways and for enforcing without delay the measures of relief found necessary; (b) the perpetuation of competition; and (c) publicity for the details of railway management, operation and finances.

"The failure of the first remedy was immediate and complete. The United States courts, to which appeal must be made for decrees enforcing the orders of the Interstate Commerce Commission, promptly declared that the law gave no finality to the acts or conclusions of that body; and in proceedings upon applications by the commission for the enforcement of its orders, defendant railways were permitted to introduce entirely new evidence and to adopt new lines of defense. Obviously this construction of the statute deprives pro-

cedure before the commission of any efficacy in simplifying or expediting measures for relief from railway oppression, except in those cases in which the railways see fit to comply voluntarily with its orders."

The second aim, Mr. Newcomb thinks, has been realized with practical uniformity, but argues that it has done no good, and that experience has shown that it is idle to attempt to force railroads to compete. (See RAILROADS.) He says :

"The insertion of this provision is now generally considered to have been a serious mistake, and its operation an almost insurmountable obstacle to the satisfactory enforcement of the fundamental principles of the law."

Of the third aim he says :

"In the third remedy Congress evidently intended to provide for the broadest and most comprehensive exercise of the visitatorial function of government. It authorized and required the Interstate Commerce Commission to inquire, generally, into the business of the carriers subject to its jurisdiction, and to keep itself continually informed as to the manner and methods of conducting their business, and it provided for full investigations and reports concerning all complaints against such carriers."

With what result? Mr. Newcomb conservatively analyzes the railroad situation in the United States, and says :

"The conditions described are fairly typical of those existing all over the United States. The Interstate Commerce Law has mitigated but slightly, if at all, the evil of unjust discriminations between individuals; has in but few instances moderated to any important extent the relative injustice in the charges exacted for moving competing commodities; and has almost utterly failed to remedy the far more serious inequities in rate-making which operate to the disadvantage of towns, cities or districts. The practical acquiescence of the Interstate Commerce Commission in this conclusion may reasonably be inferred from the following extract from its latest annual report :

"It is believed, as was further indicated in our last report, that the discussion of the principles and aims of the statute may well give place, temporarily, to a consideration of the means necessary to make effective and give force to the law in accordance with the purpose of its enactment. The experience and observations of the past year, in which the progress of regulation has not been entirely satisfactory, warrant the conclusion that with the official proceedings and transactions of the year relating to the operations of the law we should report as a matter of first importance and recommend the additional legislation deemed indispensable to give effect to the act in accordance with its purpose, as declared in the first three sections thereof. . . . The importance of amending the present law cannot be stated with too much emphasis. . . . It certainly cannot be believed that Congress, having once assumed to exercise a measure of control over railway carriers, will allow that control to become ineffectual by withholding the legislation found necessary to secure the results expected" (*Ninth Annual Report*, pp. 5-11).

Mr. H. L. Lloyd, in his *Wealth vs. Common-wealth*, is more severe on the commission. He says (p. 19) :

"The independent miners of Pennsylvania appealed to it. Two years and a half were consumed in the proceedings. The commission decided that the rates the railroad charged were unjust and unreasonable, and ordered them reduced. But the decision has remained unenforced, and cannot be enforced. . . . The Interstate Commerce Law provides for the imprisonment in the penitentiary of those guilty of the crimes it covers. But the only conviction had under it has been of a shipper for discriminating against a railroad."

Nor is it true in the broad sense that the Interstate Commerce Act has prevented combination. It may have prevented pooling under one

form, but the consolidation of railroads and combination of interests has notoriously gone on. The main efficacy of the law has been its use by the courts as a basis for injunctions against strikes and combinations of employees. (See INJUNCTION ; RAILROADS.)

IRELAND AND SOCIAL REFORM.

I. STATISTICAL.

Ireland, with an area of 32,337 square miles, has had great variations in population within modern times. In 1750 it had 2,372,634 ; in 1841, 8,175,124 ; then it lost by the potato famine and emigration, till in 1851 it had only 6,552,385, and in 1871, 4,704,750. From 1851-61, 114,912 emigrated annually ; from 1861-71, 76,886 ; from 1871-81, 54,271 ; from 1881-91, 71,667 ; in 1892, 52,292. In 1891, 75.4 per cent. were Roman Catholics, .94 per cent. of the Church of Ireland (Protestant Episcopal). In 1869 this Church was disestablished. (See ENGLAND.)

In 1891 there were 572,640 holdings, of which only 89,019 were over 50 acres. Acts passed since 1870 give the Irish cultivators more favorable laws than the Scotch or English as to fair rents, fixity of tenure, and free sale. Cattle-raising is the most important industry. (For other statistics, see ENGLAND.)

II. SOCIAL REFORM.

Social reform in Ireland is inextricably bound up with the past. Divided from early times between warring kings and numerous clans, Ireland was easily conquered by the English under Henry II. in the twelfth century, altho the subjection was long only nominal. When Henry VIII. attempted to introduce Protestantism into the island there were repeated revolts, ending in suppression and the bestowal of the lands of the rebellious chiefs among Scotch and English Protestants. In 1641 the Irish rose in revolt and massacred the Protestants, but were

History.

severely punished by Cromwell in 1649, and Protestants were established in the confiscated lands of Ulster. At the revolution, the Irish Catholics siding with James II., and the Protestants with William and Mary, the struggle ended in 1692, when the triumph of the Orange Party again was accompanied by excessive punishment. Secret revolutionary societies existed still, and a serious revolt occurred in 1798. In 1801, however, the Irish Parliament voted the final Union with Great Britain. Emmet's insurrection was easily suppressed in 1803, but the emancipation of the Roman Catholic Church had to be granted in 1829, and the "tithe war" compromised in 1838. O'Connell's agitation for repeal collapsed in 1843, and the revolution of 1848 was put down, but the Fenian Brotherhood arose in 1858, with, it was claimed, 80,000 adherents in the United States. Riots could be suppressed, but in 1869 the Irish (Anglican) Church was disestablished, and in 1870 the land question developed. In 1873 the Home Rule Party was developed, and led first by Butt and then by Parnell, who

formed the Irish National Land League in 1879. By skillful parliamentary tactics Mr. Parnell, defeating Mr. Gladstone in 1885, in 1886 forced him to advocate the

Home Rule.

cause of home rule for Ireland. His bill proposed the formation of a legislative body sitting at Dublin, with power on all subjects except those specially reserved for the imperial Parliament. After the defeat of the bill, land agitation was renewed, leading to a coercion act of the Conservative Party, rigorously enforced by Mr. Balfour. By 1890 the agitation had subsided, and the Government brought in and passed its Land Purchase Bill. Mr. Parnell, however, having been correspondent in a divorce suit, Mr. Gladstone declined to stand longer by his ally, and the Irish party was divided. The priests, however, opposed Mr. Parnell, and the party led by Justin McCarthy came into power. Mr. Gladstone again supported home rule, and in the elections of 1892 came into power and carried a bill through the Commons to be rejected in the House of Lords.

This review of the Irish question will show that the political agitation has been so constant in Ireland as to leave little opportunity for the development of social reform on other lines. Michael Davitt (*q.v.*) alone of the prominent Irish leaders is an out-and-out land nationalizer. Trade-unionism in Ireland in 1890 claimed 40,000 members of all kinds, mainly in Cork and Dublin. Cooperation (*q.v.*) has little popular hold.

IRON AND STEEL INDUSTRIES.—

The part played by iron and steel in modern industry has led to the present century's being sometimes called "the age of steel," tho some believe that we are now on the threshold of an electrical age. Nevertheless, iron and steel play still most important parts. Iron was known and manufactured in rude ways in ancient times, but the process of puddling and rolling, invented by Henry Colt in 1784, the employment of the hot blast by Neilson, of Glasgow, in 1830, and, above all, the introduction of the Bessemer process of making steel (patented in 1856) have revolutionized the iron industry.

In the United States, a foundry blast furnace was established at Lynn, Mass., in 1643. Iron had been manufactured in Virginia before this. Connecticut made steel in 1656. By 1750, however, Pennsylvania led, exporting 2358 tons of iron in 1772. The first iron foundry at Pittsburgh was established in 1803. In 1840, the introduction of bituminous and anthracite coal in the blast furnace wholly changed the industry. The manufacture of charcoal iron has since declined in Pennsylvania. In 1860 there were 652 establishments engaged in this industry. Bessemer steel was first manufactured in any quantity in the United States in 1867. The Siemens-Martin or open-hearth process appeared in 1869.

The capital invested in the iron industry in this country in 1890 was \$414,044,844, and the product, \$478,687,519. In 1870 the average product per establishment was \$256,446; in 1890, \$665,768. The product in 1890 was 5,049,693 gross tons, outdistancing

Great Britain by 1,370,650 tons. The industry is concentrating in large establishments. Between 1880 and 1890 the employees in iron and steel works of all kinds, except architectural and ornamental work, increased from 157,595 to 193,557. Yet the establishments decreased from 1299 to 984.

In 1890, in mining iron ore, 38,227 were employed. A census bulletin gives the following as to the wages in mining iron:

"The mechanic's wages varied from 50 cents per day in Texas, where convict labor was largely employed, to \$3.86 per day in Colorado, the average for the entire country being \$1.90, and the average number of days worked during the year 274. The total calculated wages which were received by mechanics during the year 1889 was \$1,080,406. The average wages received by the 14,531 laborers employed above ground was \$1.29, ranging from 53 cents in Texas to \$3.50 in New Mexico and Utah. These laborers worked on an average 228 days during the year and received a total compensation of \$4,277,199. The 709 boys under 16 years of age received a total compensation of \$97,279, and worked 221 days during the year. They therefore received an average of 62 cents per day, the wages varying from 49 cents in Missouri to \$2 in Colorado.

"The number of foremen or overseers working under ground was 686, altho at a number of mines foremen had charge both above and below ground, one-half time being charged to each. They received in wages a total of \$476,233, working on an average 282 days per year, and earned \$2.46 per day. The highest average wages were paid in Colorado—viz., \$3.99 per day, and the lowest in Pennsylvania, \$1.67 per day. The 124,432 miners received \$6,189,308 for their labor during the year, an average per man of \$1.91 per day during the days worked—viz., 261. The wages ranged from \$3.50 in New Mexico and Utah to \$1.13 in Virginia and West Virginia. The highest wages paid laborers under ground was in Colorado, \$2.68 per day, and the lowest in Georgia and North Carolina, 68 cents per day. In Georgia, however, some convict labor was employed, reducing the general average for the State. The 6479 laborers under ground received as wages \$2,716,424, working on an average 261 days per year, and earned an average of \$1.60 per day. The 111 boys under ground received \$19,617, working on an average 216 days and earning 82 cents per day."

The average wages paid in iron establishments in 1890 was, in the New England States, \$433 per year for skilled and \$353 for unskilled; in the Southern States it was \$582 for skilled and \$320 for unskilled.

Carroll D. Wright (*Industrial Evolution in the United States*, p. 221) puts the average wage in the manufacture of iron and steel at between \$1 and \$2, altho the rates range from 41 cents to \$19.40 per day.

The iron industry has seen many contests between employers and employees. (See STRIKES; HOMESTEAD STRIKE.) Labor organization in this industry commenced with the Sons of Vulcan, organized in 1858; but the great organization has been the Amalgamated Association of Iron and Steel Workers (*q.v.*), dating from August 4, 1874.

In England, the Friendly Society of Iron Founders (or Iron Molders) is the oldest large trade-union in England still existent, having been organized in 1809. It had, in 1890, 14,821 members, and is a leading union of the older friendly society type. The Associated Society of Iron and Steel Workers, established in 1862, had, in 1890, 7800 members, and is best known for its steady advocacy of the sliding scale (*q.v.*). The more progressive British Steel Smelters' Association, established in

Labor.

England.

Develop-
ment.

1886, originally a Scotch union, is extending all over the kingdom. The Associated Iron Molders of Scotland, established in 1831, had in 1890, 6198 members. The United Society of Boiler Makers and Iron Shipbuilders, established the next year, had, in 1890, 32,926 members. Such

are some, tho not all, of the unions connected with the iron industry in Great Britain, showing the relative importance of the iron industry in various countries. The following are the most recent statistics of the iron and steel production of the world :

COUNTRIES.	IRON ORE.		PIG IRON.		STEEL.	
	Years.	Tons.	Years.	Tons.	Years.	Tons.

English tons of 2240 lbs. are used for the United States, Great Britain, and Canada, and metric tons of 2204 lbs. are used for all the continental countries of Europe.

IRON LAW OF WAGES.—This is the name given by Lassalle to the asserted principle based on Ricardo's theory of wages (see RICARDO), and developed by the German socialists, that wages under competition must always in the long run be what will just support and renew the laborer's life. (For a discussion of this view, see WAGES.)

IRRIGATION.—The arid region of the United States, as defined by the irrigation inquiry (Department of Agriculture), embraces all west of the 98th meridian of longitude west. The geological survey limited it to the 100th meridian, the line of 15 in. of precipitation. The census of 1889-90 adopted the line of 97° longitude for the eastern limit, including thereby a subhumid section. This makes an area of about 1,100,000,000 acres. The subhumid section is nearly 2° of longitude wide on the great plains through North and South Dakota, Nebraska, Kansas, Oklahoma, and Texas; a portion also of Northern Idaho (the Pan Handle) and of Eastern Washington, as well as about one sixth of the northern and coast sections of California, must be classified in the same way. The semi-arid section embraces the great plains from 99° to 103° of longitude; also moderate portions of Oregon, Washington, and the central and foothills sections of California. For the subhumid section irrigation stands in the nature of a crop insurance, water being needed chiefly to provide against the summer drought. In the semi-arid section a moderate application of water is required, while in the arid division irrigation is absolutely required.

The amount of water "in sight" or readily available is the economic point of difference among those who have studied the problems. John W. Powell holds the more limited view of possibilities, claiming that only 40,000,000

acres may be irrigated. Major George M. Wheeler maintains the larger limits. The present writer, who has conducted for several years the United States irrigation inquiry and the investigation of underflow and artesian waters in the great plains division, holds a middle position.

The writer's estimate is that of a probable reclamation of 127,000,000 acres to be increased to 170,000,000 acres through the natural influences which will follow irrigation.

Two of these influences may be briefly indicated: 1. The capillary attraction of roots will draw the subwater plane which lies under the most arid soil surfaces up to moderate distances from the surfaces, thereby increasing utilization. 2. Plant life and cultivation will affect the surface temperature. Plant transpiration tends to rapid cooling. Atmospheric condensation must follow. Local rains will be more largely retained and distributed.

The areas capable of irrigation by water "in sight" or readily utilizable within it may be estimated as follows:

Arid, 800,000,000, one-tenth.....	80,000,000 acres.	Value.
Semi-arid, 150,000,000, one-fifth..	30,000,000 "	
Subhumid, 50,000,000, one-third..	17,000,000 "	

Total irrigable..... 127,000,000 acres.

Allowing one third more service or "duty" of water after from three to five years of irrigation supply, we may calculate on a cultivated area by the known water supplies of 170,000,000 acres. With the certainty of increased economy of rainfall, as caused by cultivation and its effects on the temperature of earth and atmosphere, we may under constant irrigation fully expect to reclaim and maintain under cultivation at least 200,000,000 acres of land now almost wholly valueless for farm purposes. In this es-

time there has been no inclusion of possible small bodies of land within our great pastoral areas that may be brought to cultivation for grass, roots, and hardier grains, and which may reach several million acres. It will not be extravagant, then, to estimate that under a wise, comprehensive, and beneficial policy, supervised by nation and States, for the preservation of forest, the conservation and management of water, and the proper utilization of pastoral lands, there will be within a comparatively brief period 225,000,000 acres of desert and semi-desert lands added to the food-producing area of the United States. It is estimated that each irrigated acre will produce at least four times as much as any acre, within similar areas, under ordinary cultivation.

The cost of such reclamation in the British Indies, where the work is accomplished on a large scale and with a solidity and expense that we shall not need to equal, makes the average for works—ditches, dams, headgates, etc.—about \$9 per acre. Adding cost of preparing land, etc., the average rate, first cost of irrigation and cultivation, it need not exceed \$20 per acre, or a total on one-tenth of the arid region of *four billion* dollars. Such lands, applying present rates, will be then worth \$50 per acre; the acre water rights will be valued at not less than \$30 each, a total of \$80 per acre, or in all *sixteen billions*. This leaves on total first cost and plant a profit of three-fourths—*twelve billions*. The annual outlay per acre thereafter, maintenance and repairs, farm work and interest, should not exceed \$7 per acre. Net crop returns will average \$16 per acre, leaving a profit of \$11, or a total return on the full acreage estimated of \$2,200,000,000. Besides this vast return there must be taken into account the economic values of town, mines, transportation, mercantile, manufacturing and commercial life, which such farm labor and returns will readily create. This will annually return at least as much more, while the fixed wealth, property, interest and plant will be worth enough more to make the total valuation at least *forty billion* dollars.

As to population: France supports three persons to the acre; Japan, 11; the United States one to each three acres.

From a United States census bulletin (1894, F. H. Newell special agent) the following irrigation statistics for the census year (May 30, 1889, to June 1, 1890) are collated.

In the first division the statistics given are:

Total number of farms enumerated in arid region, 123,143; total number of irrigators in 1889, 52,584; area irrigated, acres of, 3,564,416; average size of such farms in acres, 68; average value of product per acre, \$14.80; total acreage of farm holdings containing such areas, 17,199,925; per cent. of irrigated lands therein, 20.72; average percentage of irrigated acres to entire land surface, 0.50; per cent. of crops to total acreage, forage and miscellaneous, 65.31; per cent. in cereals, ditto, 34.69.

Of irrigated lands, average value per acre is \$8.23; products, value \$14.70; cost of water rights, \$8.15; annual (rental) value of water, \$1.07; cost of preparing and leveling land, \$12.12.

Statistics. Average cost per acre of land (estimate on Government rate). \$1.25; total cost of land, water, rental and preparation,

\$21.32. Average value (1890) of water rights per acre, \$26.

The total costs, as estimated on foregoing averages, upon 3,561,416 acres, are: Land, \$890,354; water, \$20,049,982; annual water rentals, \$3,824,005; land preparation, \$43,200,709; total according to census figures (1890), \$78,965,050.

The statistics for the second or subhumid division are quite meager. The census bulletin gives them as follows:

Number of irrigators (1889), 1552; acres irrigated, 66,965; average size of such farms in acres, 43; total acres in farm areas, 1,545,993; per cent. irrigated, 6.40.

Values in subhumid division for 1890 are given as follows: Average first cost of water, \$4.07 per acre;

annual rental per acre, \$1.21; land preparation, \$4.62 (original cost of land not given); the total stated is \$9.90 per acre.

The census bulletin shows further the number of artesian wells within whole region under review. The totals given (omitting New Mexico and Arizona) are: Wells on farms, 8097; average depth, 210.14; average cost, \$245.58; average discharge per minute, 51.43 gallons; used in irrigation, 3930; acres irrigated thereby (estimated), 51,896. The area served by each is averaged at 13.21 acres. No statement is given to show whether this acreage is included in the total irrigated area, but it probably is not.

The table annexed gives figures taken from returns and estimates gathered by the writer during the earlier months of 1894. They are careful and conservative, and the increase of cultivated acreage since then will make a total of at least 8,750,000 acres.

	Estimated Area now Cultivated.	Estimated Mean Annual Precipitation.
Arizona	600,000	*10.28
California	3,000,000	†16.59
Colorado	2,000,000	‡14.77
Idaho	350,000	15.00
Montana	450,000	15.00
Nevada	490,000	10.00
New Mexico	550,000	12.50
Oregon	†150,000	13.00
Utah	400,000	11.00
Washington	150,000	†16.00
Wyoming	**150,000	15.00
Great Plains sections††	500,000	16.00
Total	8,450,000	13.76

The value of irrigation, then, as a maker of homes and new wealth cannot be questioned. Whether its development shall be accompanied by normal, social, and industrial progress or be left to breed the reverse, is a matter of importance. This depends upon a proper understanding of the legal as well as the political economic conditions that should govern water conservation, its management and distribution. The United States, in this as in many other ways, has begun wrong. In arid countries, where water for irrigation is a necessity of successful cultivation, the land is of little value until it has been fructified by such water. There is the possibility, then, of serious economic disorder and extended litigation. The region has been brought under our rule from sources differ-

* Highest, 14.48; lowest, 3.12.

† The State average is 25.45, but that of the 20 counties in which irrigation is largely followed is given in the table. For the balance of State it is 34.45.

‡ Foothills and east of, the mean is 13.53; in the mountains and west, it is 14.02.

§ The actual irrigation for crops did not exceed 76,000 acres; balance of 148,000 acres was pastoral irrigation, water applied to natural grass.

|| The same error was made by the census field agents in Oregon of returning grass or pastoral irrigation as that of food crops. This is shown by the wide difference between the irrigation and the regular crop bulletins in certain counties, where more for land is given as irrigated than is shown to have been cultivated for crops. This estimate is for eastern Oregon also.

¶ Estimated for the western State section.

** Of this great area, reported at 229,668 acres, there was probably not more than 60,000 actually under food crop. The balance was pastoral irrigation.

†† This embraces the two Dakotas, Oklahoma, and the western halves of Nebraska, Kansas, and Texas.

ing widely. In the Southwest—New Mexico, Arizona, California, Utah, and portions of Colorado—the original irrigators were the Pueblo people, the village and mission Indians. They held and still hold water, salt springs and licks, with land as community or common property. There is no general law, seldom a written one, but custom makes a rigid code operative within limited borders. The Roman or civil law, however, allows no recognition whatever of property rights in this use. Water is treated by it as a natural element, necessary for life as is the air itself. The civil code controls in legal principles the whole region taken over from France, Spain, and Mexico. Treaty obligations guarantee this. By it water is a "trust," and not the property of the State any more than it is that of the individual. The Anglo-Saxon idea of legal

Legal Status.

property has since come in. The common law, built up by the customs, equities, and habits of a people using humid land, has established the doctrine that water is seized to the land through which it flows, and the restraint to the community exists only as to its use, so that injury shall not be worked to others. One riparian owner may not divert a stream without recovery to the channel or pollute the waters, to the injury or non-use by other owners, without being liable at law therefor.

This common law doctrine, however, is passing rapidly into disuse. The conditions which shaped pioneer life and the usual American disregard of the lessons from yesterday, with the indifference always shown in national legislation until an issue is forced, left the States to work out their own processes. Three distinct concepts have resulted:

1. The doctrine of "prior appropriation"—first come first served. This is the law of placer mining. It was afterward made part of the federal mining and land laws, and has been adopted into the constitutions and statutes (one or both) of the 17 irrigation States and Territories.

2. Colorado, when admitted as a State, adopted a constitutional proviso to the effect that the "natural waters" within the State are the "property" of the people thereof, subject under law and regulation to beneficial appropriation and use. Her court decisions, however, are all tending to the broad interpretation of such property as a "trust," not an ownership.

Wyoming, Montana, Idaho, North Dakota, and Utah have adopted the same or similar language. By the admission of these States into the Union it is assumed that the Federal Government has abandoned all control over waters within their borders. The States of Kansas, Nebraska, South Dakota, Washington, Oregon, California, and Nevada have no such distinct constitutional provision. They have all embodied the prior appropriation doctrine in their statutes.

3. Growing out of the confusion of Indian and other customs, California has evolved a new administrative plan. This consists in applying municipal control by permitting any body of citizens having common interests in the agricultural use of locally available water to form an irrigation district, to make plans for new works, and to

build the same, or to provide for the purchase and condemnation when necessary of existing ones; to issue bonds with which to meet the costs and expenses, to levy taxes for payment of interest and principal, and to maintain works with power to make regulation for use, etc. There are now 38 districts formed under these laws, with several million acres of land within their control. The special municipalities thus created become not the owners of water, but its administrative users and distributors. But the State may yet make its supervision active. Indeed, the development of water supply will compel such action. California is favorable for such development, inasmuch as its interstate sources of supply are quite limited. The "Wright Irrigation District System," so named from its author, Counsellor C. C. Wright, of Modesto, Cal., embodies as fundamental ideas the practical recovery of common law idea of "prior appropriation," and the Anglo-Saxon principle of municipal or local control and administration. Amendments are needed to a realization of its full benefits, but the underlying ideas need no change. Oregon, Washington, and Kansas have adopted the same general plan. Nebraska, Montana, and Idaho are considering it favorably, and it now seems probable that it will yet be the law of the arid region. South Dakota has applied it in part to her artesian supply by permitting township bonding and ownership of wells up to a certain number. The speculative promoter or negotiator does not like it; the investor accepts it, when once understood. Colorado has developed the legal control or division of the water supply at considerable cost of litigation, and Wyoming has, following on the same general ideas, framed the best plan of administrative control or administration. South Dakota, Colorado, and Wyoming provide for well-equipped State engineer offices. Nebraska and Kansas will follow suit. The general trend of court decisions is to regard water once applied to the land as escheated thereto; to regulate prior appropriations according to needs under the supply, and to regard ditch and other irrigation-water companies in the light of common carriers. There is a tendency in State legislation to regulate royalties and rentals. In Colorado and Idaho notably an agitation is growing for State ownership of irrigation works. All through the arid region the idea of public storage is becoming fixed in the popular mind. The passage by Congress (1894) of the Carey law, granting each State 1,000,000 acres of public lands to be held in trust for reclamation, is likely rapidly to accelerate this trend to public control. Utah stands in an exceptional position, as its development under Mormon direction has given a freedom, economy, and security to irrigation therein that no incorporated control will ever secure.

Civil Control.

The vital water supply issue concerns, however, the nation at large. The eastern line of the arid region—97° of west longitude—is bounded and crossed by the Missouri River for more than one third of its 1300 miles. This great river and all of its upper basin rises in and is supplied from the precipitation of our north-

west area. The Missouri is the principal affluent of the Mississippi. The two great basins and their branches drain and supply 15 great States. Yet the headwaters, with the exception of the

National Interests.

Upper Mississippi, all rise within the borders of three arid land States. Practically, too, all of the chief

affluents so rise.

Each of the three States of Colorado, Wyoming, and Montana has adopted the constitutional provision that natural waters within their borders are the property of the State or of the public thereof. They each assume that this gives them possession and control of all such supply, to the permanent exclusion, of course, of all other communities below them, provided only that they can conserve, take out, and use for "beneficial" purposes all such natural waters as find their sources within their borders. Such a position will breed difficulties. Engineers are quite generally leaning to the view that storage on an extensive scale will finally be the means adopted for the regulation and control of the lower Mississippi floods. If the General Government has no control over interstate waters under the State claims already assumed, how can the Government do this? The question may be met by stretching the theory of control over navigable waters into jurisdiction over all branches and affluents of such hydrographic basins and channels. But that will not reach such use as irrigation requires. The three States named embrace the sources not only of all leading western affluents of the Missouri and Mississippi, but they hold also the sources of the Rio Grande, the Rio Colorado, and Snake rivers.

Ninety per cent. of the natural water flow or stream to be found within the arid region rises within the borders of Colorado, Wyoming, and Montana. It needs no more than such a statement to show the importance of issues embraced in the interstate supply question. The policy of forest and water storage reservations on an extended scale, already inaugurated, should be extended until it covers the source of every interstate water supply.

The census placed the first cost of irrigation works, etc., at \$77,490,000; the value thereof in June, 1890, at \$296,850,000. The cost of irrigation works now constructed is not less than \$150,000,000; their value will be fully \$500,000,000. The water rights for 8,500,000 acres, at the census valuation of \$26 per acre, will be worth \$221,000,000. The value of the land, as placed at \$83.28 per acre (census), will be \$707,880,000. At the census rate of \$15 per acre of crop returns, we have a net annual result of \$227,500,000. Adding water and land values, we have a total of \$928,880,000, and an annual return, deducting a water rental of \$1.50 per acre (\$12,750,000), of \$214,750,000, or a profit of over 24 per cent., besides the water rental, interest on deferred payments, royalty, and increase of land values. If we add the value of land and water rights on irrigation areas, served but not yet cultivated, we shall find an estimated value of another \$1,000,000,000 to our arid domain. The estimated industrial value to water for this use of \$300 per cub. ft., which is much less than the actual possibility (counting at 1 acre-ft.

for each 130,000,000 acres), gives us a value of \$6,000,000,000 more.

These figures illustrate the immensely possible if still tentative values involved in the recognition of personal, corporate, or community property in water.

RICHARD J. HINTON.

ITALY AND SOCIAL REFORM.

I. STATISTICS.

ITALY is to-day a kingdom by its present constitution, which is an expansion of the *Statuto fondamentale del Regno*, granted on March 4, 1848, by King Charles Albert to his Sardinian subjects. By this constitution the executive power belongs solely to the sovereign. The legislative authority belongs conjointly to him and to a parliament consisting of a *Senato* and a *Camera de Deputati*. The Senate is composed of princes of the royal house and an indefinite number of prominent persons nominated by the king for life. In May, 1895, there were 397 senators. The deputies to the lower house are elected by ballot by all citizens over 21 who can read and write and pay a direct tax of 19.80 lire, or, in the case of certain peasant farmers, 80 centesimi.

The deputies number 508. In 1895 the number of enrolled electors was 2,121,125, and those who voted May, 1895, numbered 1,256,244. No priest nor one receiving State pay can be elected. Local government is in the hands of communal and provincial councils. The population in 1881 was 28,460,000, an area of 114,410 sq. m. The births steadily exceed the deaths. Emigration is large, but not larger than the excess of births over deaths. Of the total population, 62,000 were Protestants and 38,000 Jews. Under the papal authority there were, in 1881, 6 cardinal bishoprics near Rome, 49 archbishoprics, 221 bishoprics, 76,560 parochial clergy, 20,465 parishes. In 1865 there were 2382 religious houses in Italy, with 14,807 men and 14,184 women. All religious houses were suppressed in 1866, tho a small pension was given to all who had taken regular religious vows before January 18, 1864, and a few monasteries were temporarily set aside for such as wished to continue conventual life. All other property was appropriated by the State. The constitution enacts that the Catholic, Apostolic, and Roman religion is the sole religion of the State. By the royal decree of October 9, 1870, Rome and the Roman provinces were declared an integral part of the kingdom of Italy; the Pope was acknowledged supreme head of the Church, ranking as a sovereign prince. By the law of May 13, 1871, there was guaranteed to him and his successors forever the Vatican and Lateran palaces and the Castle Gandolfo, with 3,225,000 lire annually, which allowance still remains unclaimed and unpaid. The State regulates public instruction, and no person can keep a school without State authorization. Education is compulsory in children from six to nine years of age. (See EDUCATION.)

The budget for 1895-96 (June 30) was: Revenue, 1,699,088,025 lire, and the expenditure, 1,689,342,764. The larger sources of revenue were, in millions of lire: Income tax, 288; customs, 235; tobacco monopoly, 192; land tax, 106; house tax, 87; salt monopoly, 71; stamps, 70; lottery, 65. The larger expenses were, for consolidated debt, 463,000,000 lire, with 124 for floating debt; 70, redeemable debt; 223 for the Ministry of War, and 94 for the Ministry of Marine; 62 for public works. The total debt July 1, 1894, was 12,307,857,604 lire, or some \$75 per head. Exports in 1894 were 1,094,649,101 lire, and the imports, 1,026,506,700. The main imports were raw cotton, coal, wheat, and unbleached, raw, or twisted silk. The main exports were silk, olive oil, fruit, and wine. The main imports came from Great Britain, France, Germany, Russia, and Austria. The main exports are to Switzerland, France, Great Britain, Germany, and Austria. The agricultural population numbers 10,000,000.

The Church of Rome.

Financial.

II. SOCIAL REFORM.

Social reform in Italy through the first part of the century was almost wholly confined to

the noble efforts made in various ways by patriots like Mazzini and Garibaldi, by societies of various kinds like the Carbonari, to secure democratic liberty and Italian unity. (See MAZZINI; CARBONARI.) Mazzini opposed socialism as it was presented in his day as being materialistic and anti-nationalistic, and standing for an almost individualistic battle for personal rights rather than for cooperation and duty; but his position on almost all subjects was that of modern ethical socialism, and his followers in Italy have done much to develop reform of this kind. In 1861 a Fratellanza Artigiana (Artisan Brotherhood) was started in Florence connected with Mazzini's name to develop cooperation in various ways. It was intended to spread through Italy. This hope has not been realized, owing to political jealousies; but it still survives at Florence, and has several thousand members. (See COOPERATION.) In 1871 a pact of working men's societies, Patto di Fratellanza, was formed at Rome, also drawn up under the auspices of Mazzini, and still endures. It held its eighteenth general congress at Palermo in 1892, and stands for cooperation and liberty. Previously to this, however, the International (*q.v.*) had entered Italy. Bakunin (*q.v.*) founded a section at Naples in 1867, and established a paper, *Equity*. Other sections were formed in Genoa, Milan, and Italy. This movement opposed the Mazzini societies and developed strength enough to frighten the Government into suppressing the sections in 1871. It sprang up again, however, till finally again suppressed in 1875. It represented anarchist communism rather than socialism.

In 1882 the Italian franchise was widened, and in 1885 an Italian Labor Party was formed at Milan, partly socialistic, partly anarchistic. It won strength enough to cause it to be dis-

solved by the Government in 1886. A new laborers' party (Partito dei Lavoratori), however, was formed at congresses in Milan and Genoa in 1891 and 1892.

In September, 1893, the party held a second congress at Reggio (Emilia), when it assumed a distinctly socialist attitude, and adopted the name of Italian Laborers' Socialist Party (Partito Socialista dei Lavoratori Italiani). The reports of the central committee to this congress and to the International Congress at Zurich (1893) give some further interesting details concerning the development and present position of the party, which may be added to the above account. Owing to the remissness of the affiliated societies in furnishing the committee with returns, it has not been found possible to publish perfectly satisfactory statistics, but it is probable that the party includes at the present time not less than 200,000 active members, and almost 300 affiliated societies, among them the agricultural federations of Mantua, with about 11,000 peasant members.

The party works on the lines of German socialism, but has not German organization, standing at present principally for agitation. More immediately practical is the establishment of labor chambers in Italy. (See LABOR EXCHANGE.) Cooperation has had considerable development in Italy, particularly interesting being the cooperative societies of the laborers and builders, who take contracts directly from the municipalities. (For an account of this, however, see COOPERATION.) Anarchism has still considerable hold, particularly in the inflammable South, where, however, conditions seem almost to drive the peasants into it.

Reference: The best book in English on social reform in Italy is the *Report on Italy* of the (English) Royal Commission on Labor.

J.

JACKSON, ANDREW, seventh President of the United States, was born in the Waxhaw Settlement, Union County, N. C., March 15, 1767. He was of Scotch-Irish parentage, his father a farm laborer. Both parents died early, leaving their children destitute. With little schooling young Jackson worked his way in a saddler's shop and by teaching school, and in 1786 was admitted to the bar. In 1790 he was appointed by Washington United States Attorney for the newly constituted Territory of Tennessee, and became most active and prominent. In 1796 he was Tennessee's first representative in Congress, and in 1797 United States Senator. In 1798 he resigned, and became a Judge of the Supreme Court of Tennessee till 1804. In 1803 he was an unsuccessful candidate for appointment as governor of the new Territory of Louisiana. In 1804 he retired from politics, but in 1813 led the forces of Tennessee to New Orleans in the War of 1812, and in 1814 was made Major-General. The famous victory of January 8, 1815, made him a popular hero. In 1821 he was appointed Governor of Florida. In 1824 Jackson,

nominated by the Tennessee Legislature, received the largest popular vote for the Presidency, but John Quincy Adams was elected by the House of Representatives. In 1828 Jackson was elected, and this election is considered the beginning of the modern Democratic Party (*q.v.*). Inaugurated March 4, 1829, he at once removed all incumbents belonging to the opposite party. He also commenced war on the national banks. (See BANKS AND BANKING.) In 1832 he received 219 out of 288 electoral votes. In 1833 he removed the Government deposits from the United States Bank. The national debt was extinguished, but in 1837 came the first great panic. In 1836 Jackson succeeded in obtaining the election of his friend Van Buren, and, retiring from politics, died June 8, 1845. Of violent and impulsive temper, perhaps no American statesman has been more loved, hated, opposed, and admired.

JACOBINS.—Jacobin was the name chosen by a French political club founded in 1789 by some deputies from Brittany during the session

of the States-General at Versailles. (See FRENCH REVOLUTION.) The club was first called the Breton Club, then the Société des Amis de la Constitution. After the Assembly went to Paris the club occupied an old Dominican monastery in the Rue Saint Honoré. These Dominicans had been called Jacobins from a fact that the Church of St. James (Jacobus) had been given to them, and the political club now took their name. Lafayette and Mirabeau, among others, at first belonged to it, but as its principles dominated the commune it became more and more radical. Its *Journal des Amis de la Constitution* spread its principles through France. Robespierre became the ruling member, and after his downfall in 1794 the club was also overthrown, and in November was suspended. Persons of extreme revolutionary principles are still sometimes called Jacobins.

JACQUERIE.—In May, 1358, rebelling against the tyranny of Charles the Bad of Navarre and of the nobility, the French peasants rose in revolt during the imprisonment of John II., the Good, in England. The revolt commenced near Paris, but spread to the Marne and the Oise, and for three weeks carried all before it; but in June it was put down with great slaughter at Meaux. The name comes from the Jacques or clowus, used for peasants, from the Christian name Jacques, supposed to be peculiarly a peasant name.

JAMES, EDMUND JANES, was born in 1855, at Jacksonville, Ill. He was prepared for college in the Illinois State Normal School, and entered the Northwestern University at Evanston, Ill., in 1873. Having been appointed Recorder on the United States Lake Survey, he joined (May 1, 1874) the party of Engineer Terry, engaged on the upper St. Lawrence and the lower part of Lake Ontario. At the end of the season he entered Harvard College.

In July, 1875, he went to Europe to study political economy, and attending lectures also at Berlin and Leipsic, was graduated from Halle in 1877, taking the degrees of M.A. and Ph.D.

On his return home he was principal of the high school in Evanston, Ill., and of the high school department of the Illinois State Normal School. He resigned this position in 1882 in order to continue his studies in Europe, which he pursued at various German universities.

In 1883 he was elected Professor of Public Finance and Administration in the Wharton School of Finance and Economy, University of Pennsylvania, and since 1886 has had practical charge of this department. In 1891 he was elected President of the American Society for the Extension of University Teaching, and held this position until 1895, during which time the work of the society was greatly extended and strengthened.

In 1896 he went to the University of Chicago as Professor of Public Administration in the Department of Political Science, and Director of the University Extension Department.

Professor James has been and is an active member of many educational and economic associations. He was one of the founders of the American Economic Association, and for some

time its Vice-President. He was one of the founders of the American Academy of Political and Social Science, and at the first meeting for formal organization, December 14, 1889, was elected President, an office to which he has since been annually reelected. He was also, till his removal to Chicago, editor, and is still associate editor, of the *Annals* of the academy.

With Dr. Charles De Garmo, President of Swarthmore College, he founded the *Illinois School Journal*, now the *Public School Journal*, one of the most influential educational periodicals in the West.

He was one of the first to take part in the recent movement for the improvement of city politics in the United States; was one of the organizers of the Municipal League of Philadelphia (out of which the National Association of Municipal Leagues has grown), and served as its first president from December 1, 1891.

Professor James' contributions to the literature of the subjects in which he has been interested have been very numerous, tho they have taken the form of papers, magazine and cyclopaedia articles, addresses, etc., rather than the form of books. Among them are *The Relation of the Modern Municipality to the Gas Supply* (1886); *The Canal and the Railway* (1890).

JANNET, CLAUDIO, was born at Paris in 1844. He became a lawyer at Aix and later Professor of Political Economy at the Catholic University of Paris. Some of his principal works are: *De l'état présent et de l'avenir des associations coopératives* (1867); *l'Internationale et la question sociale* (1871); *les Institutions sociales et le droit civil à Sparte* (1874); *les États Unis contemporains* (1875); *les Faits économiques et le mouvement social en Italie* (1889); *le Socialisme d'État et la réforme sociale* (1889); *le Capital, la spéculation et la finance au XIXe siècle* (1892). Jan-net belongs to the school of Le Play.

JAPAN AND SOCIAL REFORM.—We consider Japan under two general heads: I. Statistics; II. Social Reform.

I. STATISTICS (IN GENERAL).

The Japanese claim that their empire was founded by the first emperor, Jimmu, 660 B.C., and that the present emperor is descended from him, having overthrown in 1868 the power of the Shogun, who had ruled since the twelfth century. In 1871 the feudal system was suppressed. In 1889 a constitution was proclaimed, and Japan is now a constitutional empire. The emperor, with advice of a Cabinet and Privy Council, has the executive power, even to declaring war and making peace. Laws must receive the consent of the Imperial Diet, consisting of a House of Peers and of representatives, each with about 300 members. The representatives are elected by male subjects of 25 years of age resident one year in the Fu or Ken, and who pay 15 yen or more as a national tax. Voting is by secret ballot. Local self-government is on the increase.

The population December 31, 1893, was 41,388,313 in an area of 147,655 sq. miles, not including Formosa. There is absolute religious freedom, tho the principal Shinto temples are maintained by State or local authorities. There were in 1893, 193,430 Shinto temples, and 71,839 Buddhist. Education is compulsory, with 23,960 elementary schools, 1410 special, and 427 others. Justice is modelled on European lines.

The revenue, 1894-95, was 88,045,234 yen, and the expenditure, 80,140,500. The main source of revenue

Constitution.

Social.

(nearly 50 per cent.) is a land tax; the main expenses are interest on the public debt, and for the army and defenses. The peace footing of the army in 1893 was 3615 officers, 65,098 men, 218 students. The reserve has 94,676, and the *landwehr*, 105,053. The total war strength is now said to be 328,000. The Japanese navy has 9 armored ships, 32 unarmored, 28 gunboats, 11 lesser vessels, and 75 torpedo boats.

The land is cultivated by peasant proprietors, tenancy being rare. Rice is with the largest crop. The exports in 1894 were 121,677,263 yen, and the imports, 113,308,997. The chief exports are silk, tea, and rice; the main imports, raw cotton, sugar, and machinery. The largest exports are to the United States, France, and Hongkong; the largest imports from Great Britain, China, and the United States.

II. SOCIAL REFORM.

The following is from the United States Consular Reports of May, 1896:

"The development of both internal and foreign trade is the all-absorbing problem with every class of the people of Japan. The system of education employed in the schools is admirably adapted to the turning out of well-equipped business men, so far as a practical commercial education can accomplish such an end.

"Merchants, manufacturers, and, in fact, all engaged in trade actively or by investment of capital are making and will continue to make the very best use of the time intervening between the present and the coming into operation of the lately revised treaties, in borrowing, *ad libitum*, the products (in the shape of labor-saving appliances) of the inventive genius of the people of the United States, and of every other nation, for use in the workshops of the Empire, and will return the results in merchantable goods to the people of the nations from whom they are now borrowing at prices which will make competition an exceedingly difficult problem to solve.

"The Japanese excel in productions of silk, jute, cotton, clay, iron, and straw in the shape of piece goods, wearing apparel, floor coverings, porcelain wares, curios of every description, mechanical and other toys, paper, and other goods in which they are the principal commodities used, and in retail products, among which may be mentioned surgical instruments, which, for delicacy of design and quality of temper, can scarcely be surpassed.

Manufactures.

"The raw material necessary for the production, not only of the merchandise named, but of nearly all other goods produced by the most favored of the producing nations, are found in the territory of the empire, the material wealth and producing power of which have been enhanced in no small measure by the annexation of Formosa. The mines are rich in coal, iron, and other minerals; the soil is fertile, and, judging from the extraordinary progress being made in agricultural pursuits, every available foot of it will, in the near future, be put into a high state of cultivation. In many of the subdivisions of Japan, two crops are produced annually.

"The daily wage paid for mining and unskilled labor necessary for the production of what may be termed raw materials will average about 10 cents (United States currency), and that paid for skilled labor, at present, will average about 18 cents.

"With her natural advantages, the method of education employed in the schools and the universality of effort in the direction of increasing trade internally and directly with the people of other nations, it would seem that the Empire of Japan is destined to become the great producing nation of the Orient. But before such a conclusion can be accepted, consideration should be given to certain drawbacks, among which may be mentioned the inability to produce quality and quantity in accordance with contract stipulations. This defect is subjecting her tradespeople to very serious criticisms on the part of those with whom they trade; and by many it is alleged to be due to a lack of commercial probity. I am not of that opinion, but rather ascribe it to a lack of training in the art of producing stated quantities in stipulated periods. In short, they can produce, under present conditions, quality, but not quantity.

"Up to the date of the recent war with China, it seemed impossible to persuade Western people to take the new Japan seriously. It needed the crushing defeat of the Chinese Empire to open people's eyes. To

be sure, the events which electrified the rest of the world excited no surprise whatever in Japan, where the issue was foreseen with absolute clearness before a shot was fired.

"Since the conclusion of the war, renewed activity is noticeable in every branch of industry. The huge cotton mills that have sprung up in Osaka and other towns are among the most noteworthy of new enterprises set on foot from day to day. Every town and city, and the country generally, has an air of prosperity. Gas and electric light are more and more used, and, in the larger centers of population, are all but universal. In several towns, the electric-light apparatus is worked by water power—a source of energy practically unlimited, and hitherto scarcely utilized.

Progress.

"The railway system is extensive and admirably managed, and every corner of the empire is now provided with good macadamized roads, an inestimable boon.

"It is impossible for me to conclude these brief notes without some mention of the numberless schools, public and private, in Japan. The Government is thoroughly alive to the national importance of education."

JEFFERSON, THOMAS, third President of the United States, was born in Albemarle County, Va., April 13, 1743, the son of a citizen of some importance. Attending William and Mary College, and studying law at Williamsburg, he was admitted to the bar in 1767, and soon acquired standing and wealth, and in 1772 married an heiress. From 1769 to the Revolution he served in the Virginia House of Burgesses. Tho' no orator, he soon became a leader of the opposition to the king, and June 21, 1775, took his seat in the Continental Congress. He drafted the Declaration of Independence. In 1776 he resumed his seat in the Virginia Legislature, and secured the first law establishing perfect religious freedom. From 1779 for two years he was Governor of Virginia. In 1782 his wife died, and, distracted with grief, he accepted an appointment as Minister to France. In 1789 he was appointed by Washington Secretary of State, and served till 1794, when he resigned. During this period the Democratic Party (or Republican-Democratic Party as it was first called) developed with Jefferson as leader, opposed to the federalism of Hamilton, Jefferson's colleague in the Cabinet. In 1796 Jefferson was elected Vice-President, and in 1800 President. During his administration the public debt was reduced, Louisiana was purchased for \$15,000,000, the Algerian pirates conquered, and the system of precedence was abolished for a reasonable etiquette. Jefferson was elected in 1804 almost without opposition. His embargo policy, retaliating upon France and England prohibiting United States vessels from leaving port, struck a blow at the navy, and opposition to him increased. In 1808 he declined to be nominated for a third term, and retired to Monticello, where he interested himself in founding the University of Virginia. He died July 4, 1826. (See DEMOCRATIC PARTY.)

JENKS, JEREMIAH W., was born in 1856 at St. Clair, Mich. He graduated from the University of Michigan in 1878, receiving the degree of A.M. in 1879 and the degree of Ph.D. in 1885 from the University of Halle, Germany. He has taught at Mt. Morris College, Ill.; Peoria High School, Ill.; Knox College, Galesburg, Ill.; Indiana State University, Bloomington, Ind., and at Cornell University,

where, since 1891, he has been Professor of Political, Municipal, and Social Institutions. He is Secretary of the American Economic Association, and of the Finance Department of the American Social Science Association. His writings have been numerous, but have taken the form of monographs, magazine and cyclopedia articles, addresses, etc., rather than of books. He has written particularly on elections, ballot reform, and similar political subjects.

JEVONS, WILLIAM STANLEY, was born in Liverpool in 1835. He went in early life to Australia, and held the post of assayer in the Sydney Mint from 1854-59; he then returned to England in order to pursue his studies in philosophy and ethics. He was Professor of Logic from 1866-76 at Owens College, Manchester, and of Economics at University College, London, from 1876-81. He met his death by drowning at Bexhill in 1882.

Cossa says of him in his *Introduction to Political Economy* :

"In him logical powers of the highest order were happily associated with the trained acuteness of a mathematical expert and the rare gifts of a born economist, and to all these was added a unique aptitude for statistical observation. He was equally at home when presenting the results of his investigations in such a popular form as that of his *Primer of Political Economy* (1878), his *Money the Mechanism of Exchange* (1879), and when employing the more abstruse language of science, as in his *Principles of Science* (1874, 2 vols.). Something fantastic, however, will at times lie in wait for his readers even in the midst of such a vigorous concatenation of reasoning as that in his account of commercial crises."

Professor Ingram says of him :

"The reputation of Jevons as an acute and vigorous thinker, inspired with noble popular sympathies, is sufficiently established. But the attempt to represent him, in spite of himself, as a follower and continuator of Ricardo, and as one of the principal authors of the development of economic theory (meaning by 'theory' the old *a priori* doctrine) can only lower him in estimation by placing his services on grounds which will not bear criticism. His name will survive in connection, not with new theoretical constructions, but with his treatment of practical problems, his fresh and lively expositions, and, as we have shown, his energetic tendency to a renovation of economic method."

In the field of applied economics Jevons often discussed monometallism and bimetallicism, declaring himself, tho' in very temperate and guarded terms, a monometallist. He favored cooperation and profit-sharing, and also believed in State legislation on social questions. (See his *The State in Relation to Labor*, 1882.)

In economic theory he is best known for his conception of total utility (*q.v.*). Besides the above-mentioned books there should be noticed his *Theory of Political Economy* (1879); *Methods of Social Reform* (1883); and *Investigations in Currency and Finance* (1884).

JOBS, as used in political science, are defined by the *Century Dictionary* to be undertakings "so managed as to secure unearned profit or undue advantage, especially a public duty or trust performed or conducted with a view to improper personal gain." Mr. Ferdinand Seege, writing in the *North American Review* (vol. cxliii., p. 87), says :

"Nearly all the very large corporate undertakings in the United States during the past 20 years have had

in them more or less of the corrupt political and financial elements which the public have come to sum up in the word *job*."

The writer gives many instances of jobs, as "the Broadway Steal" (*q.v.*), "the Cable Road Grab." Of the New York new aqueduct he says :

"The 'biggest job,' as well as the largest project, now under way in any city of the United States, is probably that of the new aqueduct, which is to be the main source of our New York City water supply."

"The new aqueduct is to be 31 miles long. Through 10 miles of this area nature has furnished a solid rock bottom, perfectly water-tight, and much better than any artificial bottom that could possibly be constructed. Yet the Board of Aqueduct Commissioners has voted to line the entire aqueduct with brick, bottom and all, including the 10 miles already lined with the best of natural stone. Controller Loew opposed this worse than useless expenditure, intended wholly for the benefit of political corruptionists, but the job has been sustained by the majority of the board. When the matter came up, the controller offered a resolution that the work be done as any sensible business man would do it for himself—that is, that the aqueduct be lined only where necessary. The resolution was voted down, Mayor Grace alone sustaining the controller. Judge Spencer, the Tammany member of the Aqueduct Commission, then offered a resolution that the whole structure receive the brick lining. The resolution was passed, the mayor and the controller voting against it. In the passage of this little resolution, the people of New York City were put to an unnecessary expense of a million and a half of dollars, in order that the contractors and, indirectly, a political ring, might profit by it."

"In order, however, that the ring might not be troubled with such 'factious opposition' to future jobs of the kind, the ring decided to legislate the inconvenient mayor and controller out of the Board of Aqueduct Commissioners, altho' they were the chief representatives and the only safeguards to the city, for whom the aqueduct is being constructed. The bill was therefore introduced in the Legislature and swiftly passed—'kissed through,' as it is termed by Hon. Timothy J. Campbell, which is the technical name for a corrupt bargain between political managers for both parties, and was signed by Governor Hill.

"Among the most prominent and influential of these contractors are Messrs. Clark and O'Brien, Mr. O'Brien being chairman of the Democratic State Committee and also the political special manager and henchman of Governor Hill. The opinion now and then escapes the intimate friends of these gentlemen that the 'aqueduct job,' if 'handled for all it is worth,' will furnish the financial sinews (or what they briefly term 'the party bundle') to make Mr. Hill the next President of the United States.

"The work on the aqueduct is supposed to be given out to the lowest bidder. One precarious section of it, under the Harlem River, was allotted some time ago to Messrs. Clark and O'Brien, at an allowance of \$50,000 more than the lowest bid, for fear that the lowest bidder might not do the work well. But it was immediately sublet to this lowest bidder, and the difference pocketed."

(See also CORRUPTION ; CITY MUNICIPALISM.)

JONES, RICHARD, was born at Tunbridge Wells, England, in 1790. He graduated from Cambridge in 1816, was ordained to the ministry, and took a curacy in Sussex. In 1833 he became Professor of Political Economy at King's College, London. In 1835 he succeeded Malthus in the chair of Political Economy and History at the East India College, Haileybury. From 1836 to 1851, he occupied the position of commissioner under the Tithe Commutation Act. He died at Haileybury, January 26, 1855. His chief works are : *An Essay on the Distribution of Wealth and on the Sources of Taxation, Part I., Rent* (London, 1831); *An Introductory Lecture on Political Economy, delivered at King's College, with a Syllabus of*

a *Course of Lectures on the Wages of Labor* (London, 1833); *Text-Book of Lectures on the Political Economy of Nations* (Hertford, 1852). As an economist, Jones stands between the school of Adam Smith and the modern historical economists. He recognizes strongly the necessity of the inductive method, and opposes the deductive method of Ricardo.

JUDAISM, SOCIAL POLITY OF.—All views and interpretations of the sacred books of the Hebrew race find in them the institutes of a peculiar social polity. Viewed as the product of infallible inspiration or in the light of the latest and highest criticism, the Old Testament records a social polity, whether given of God in immediate revelation or developed through long ages of national evolution, of deepest interest and most practical significance. The heart of the whole is in the national law. Says Canon Fremantle (*The World the Subject of Redemption*):

"The Law was the center of the religion and theology of Israel. . . . It was not 'the law of commandments contained in ordinances,' but the law of righteousness, which underlays the ordinances. . . . The mere ceremonialism, apart from moral good, finds no encouragement in the Old Testament. Against that all the prophets from Hosea onward protest. . . . The law of moral and political relations is the center of the theology of the Old Testament. . . . The theme which is more than any other upon their poets' lips is the law of Jehovah. . . ."

"In the Psalms there are a few faint allusions to ceremonial customs, such as the laws of drink offerings of blood, or of forbidden food, or the purging with hyssop; a few words about the new moon and solemn feast days; not a word about circumcision, not a word about the passover, not a word about the Sabbaths, not a word about ceremonial uncleanness. There is probably in modern hymns, 18 centuries after Christ, more of artificial religion than in the Psalms, written in the bosom of Judaism. But, on the other hand, almost every Psalm appeals to the law of plain justice, public and private. . . . It is the moral and political law, not the ceremonial, which is enshrined in the hearts of the people."

The basis of the whole law is the recognition of Jehovah as the 'God of the nation, the Creator and Ruler and Owner of the earth. Land belongs to Him; His are the firstfruits; He is the God of Abraham, of Isaac, and of Jacob; His law is to be obeyed. This law is given to the organized nation,

National Basis.

not to individuals. The first duty of parents to the male child or of a Gentile convert was circumcision, the symbol of initiation into the

national life. The Law was not given to any person in view of a personal relation to God, but only to the circumcised, or their wives and daughters, those who belonged to the organic national life. It was, thus, primarily a law of institutions. With the organized national life went the family. The first duty of the circumcised child was to obey and honor his parents (Ex. xx. 12). "Thou shalt rise up before the hoary head, and honor the face of the old man" (Lev. xix. 32). Purity and chastity were strictly inculcated. The law allowed polygamy; but he who follows the development of the Hebrew people from the obscenity and impurity, into which they are recorded as falling, through idolatrous practices, in the early years of their history, into the comparative purity and monogamy which prevailed among the Jews in the

time of Christ, will realize how practically the Law aided and developed pure family life.

As in all patriarchal civilizations, the servant or slave was made a member of the household. Slavery was allowed, but it was nothing like chattel slavery; it was scarcely slavery. In Judea alone of all countries, ancient and modern, the slave had rights and was not under the caprice of his master.

Every Hebrew slave could go free **Treatment of the Poor.** at the end of the sixth year (Ex. xxi. 2). He was to be furnished

liberally out of the flock, and out of the flour, and out of the winepress (Deut. xv. 14). The wages of servants were to be paid every night: "The wages of him that is hired shall not abide all night until the morning" (Lev. xix. 13). Charity in all relations was inculcated: "Thou shalt love thy neighbor," said the law (Lev. xix. 18); "Thou shalt hate thine enemy" was an unauthorized addition. Justice in trade was a sacred duty (Lev. xix. 36); but the needy were particularly to be aided. "If there be among you a poor man, of one of the brethren, within any of the gates in the land which the Lord thy God giveth thee, thou shalt not harden thy heart, nor shut thine hand from thy poor brother, but thou shalt open thine hand wide unto him and shalt surely lend him sufficient for his need" (Deut. xv. 7, 8). The loan was to be without interest. "If thou lend money to any of My people that is poor by thee, thou shalt not be to him as a usurer; neither shalt thou lay upon him usury" (Ex. xxii. 25). Usury meant interest; the word is sometimes translated increase. "Thou shalt not lend upon usury to thy brother, usury of money, usury of victuals, usury of anything that is lent upon usury," said the Deuteronomic law. This was not a moral law of universal validity. The Hebrew was allowed to take interest from a Gentile. "Unto a stranger thou mayest lend upon usury" (Deut. xxiii. 20). It was a socialist law, and one had to belong to the instituted nation to gain its benefits. Those who walked through cornfields or vineyards were to be allowed to pluck of the corn or the vine (Deut. xxiii. 25). The widow and the orphan were particularly to be cared for (Deut. x. 18).

All these enactments were made possible by the Hebrew land law. Under private property and a competitive civilization it is impossible to lend without interest to every one that asks, or to allow trespassing on a planted field or vineyard. Under **Land Law.** the Hebrew law it was possible, because everybody was protected in the *use* (not ownership) of a little land, and therefore those who needed to borrow or receive aid were comparatively few. God was considered the owner of all the land, and it was meted out not for ownership, but for use. "The land shall not be sold forever, for the land is mine," God is represented as saying in Lev. xxv. 23. The land was supposed to have been measured out by Joshua by the line and the lot, and a portion assigned to each family according to its size. And this ownership for use was inalienable. If any family became embarrassed and gave the land in debt, it returned on the fiftieth year—the year of jubilee

—to its former owner. This was the wording of the law as given in Lev. xxv. 24-31 :

"And in all the land of your possession ye shall grant a redemption for the land.

"If thy brother be waxen poor, and hath sold away some of his possession, and if any of his kin come to redeem it, then shall he redeem that which his brother sold.

"And if the man have none to redeem it, and himself be able to redeem it;

"Then let him count the years of the sale thereof, and restore the overplus unto the man to whom he sold it, that he may return unto his possession.

"But if he be not able to restore it to him, then that which is sold shall remain in the hand of him that hath bought it until the year of jubilee; and in the jubilee it shall go out, and he shall return unto his possession."

There was a difference, however, with walled cities.

"And if a man sell a dwelling-house in a walled city, then he may redeem it within a whole year after it is sold; *within* a full year may he redeem it.

"And if it be not redeemed within the space of a full year, then the house that is in the walled city shall be established forever to him that bought it, throughout his generations: it shall not go out in the jubilee.

"But the houses of the villages, which have no walls round about them, shall be counted as the fields of the country: they may be redeemed, and they shall go out in the jubilee."

The object of this distinction seems to have been to make agricultural life and property more secure than city life and property, in order to encourage agricultural life. But it was not only the land that the law protected for the use of all. It was a socialist law in that it protected the worker in the ownership of his tools. If he gave them in pledge they could not be kept from him overnight. Says Deut. xxiv. 10-14 :

"When thou dost lend thy brother anything, thou shalt not go into his house to fetch his pledge.

"Thou shalt stand abroad, and the man to whom thou dost lend shall bring out the pledge abroad unto thee.

"And if the man be poor, thou shalt not sleep with his pledge:

"In any case thou shalt deliver him the pledge again when the sun goeth down, that he may sleep in his own raiment, and bless thee; and it shall be righteousness unto thee before the Lord thy God."

Verse 6 in the same chapter says: "No man shall take the nether or upper millstone to pledge, for he taketh a man's life to pledge." Protected thus, both in the access to land and the use of tools, no Hebrew, as long as the law was obeyed, need be poor. Taxation was a single tax of one tenth of all produce of the soil or the flock. This prevented all extortion of financiers. The whole system of laws was connected with a ritual to connect the political Law with the thought of God. Great religious festivals were organized

Religious Sanctions.

in connection with the national history and with the seasons. The Levites administered the law in connection with the temple or religious gatherings. The people, in solemn assemblies, repeated the curses and blessings of the Law. The whole law of the land was connected with the religious Sabbatical feasts. One day in seven the laborer found complete rest. One year in seven the land was to go untilled; the slave was to go free; one year in seven times seven was the year of jubilee, when land reverted to the owner and every mortgage was wiped off. Religion was thus associated with relief from labor and release from debt.

There was no king; those ruled who showed themselves inspired of God; the nation was organized by tribes, families, and other divisions. Such was, in brief, the Hebrew social polity. In practice it was overthrown. The Hebrew people eventually chose a king, and found slavery and captivity. Some think the Law was never fulfilled; that the Law we have summarized was only very gradually developed. With the history we are not here concerned. Christian socialists believe that it needed the Spirit of Christ to fulfil the law. (See CHRISTIAN SOCIALISM.) Socialists argue that the world was not yet ready for socialism. Individualists claim that it was an impossible and impractical legalism.

JUDICIARY.—We consider in this article the judiciary system of the United States alone (1) because, on account of the size of the country and the involved relation of federal and State courts, the system is very much more complicated and involved in this country than in any other, and gives example of almost all judiciary problems; and (2) because in no other country does the judiciary play the important political part that it does in the United States; for in no country except the United States is the Supreme Court of justice also the Supreme Court of legislative judgment.

We shall treat in this article of—I. The Federal Courts; II. The Relation of the Supreme Court to the Constitution; III. The State Courts; IV. The Miscarriage and Reform of Justice.

I. THE FEDERAL COURTS.

The Constitution gives to the federal courts jurisdiction in

"1. All cases in law and equity arising under the Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority.

"2. All cases affecting ambassadors, other public ministers, and consuls.

"3. All cases of admiralty and maritime jurisdiction.

"4. Controversies to which the United States shall be a party.

"5. Controversies between two or more States, between a State and the citizens of another State, between citizens of different States, between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign States, citizens, or subjects.

"The judicial power of the United States is here extended to controversies between a State and citizens of another State. This clause gave much discussion at the time the Constitution was adopted, and the States were unwilling to be subjected to lawsuits brought by citizens of other States. Accordingly, an amendment to the Constitution was proposed, and on January 8, 1793, the President announced to the Congress that the amendment had been adopted by three fourths of the States, and was, therefore, a part of the Constitution. This constitutes the eleventh of the amendments, and is as follows:

"The judicial power of the United States shall not be construed to extend to any suit in law, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State."

The federal courts are of three kinds—the Supreme Court at Washington, circuit, and district courts. The Supreme Court has nine judges—a chief justice **Jurisdiction.** (salary, \$10,500) and eight associate judges (salaries, \$10,000). They are nominated for life by the President and confirmed by the Senate, and are removable only by

impeachment. Only once has a judge of the Supreme Court been impeached—Samuel Chase, of Maryland, in 1804-5, and then unsuccessfully. The Supreme Court sits from October to July of each year. Six judges must be present to pronounce a decision, and every case is discussed by the whole body twice over.

The circuit courts number nine, each with two judges (salaries, \$6000), and to each is allotted a judge of the Supreme Court. A Circuit Court of Appeals was established in 1891, to attempt to relieve the overtaxed Supreme Court. District courts number 45; and there has been established at Washington a special Court of Claims. All Federal judges are appointed for life (subject to impeachment), as the Supreme judges, tho the Constitution does not state that this should be so. The jurisdiction of the Supreme Court in cases affecting ambassadors, and where a State is a party, is original; in all other cases it is appellate.

The criminal jurisdiction of the federal courts, which extends to all offenses against federal law, is purely statutory. "The United States as such can have no common law. It derives its powers from the grant of the people made by the Constitution, and they are all to be found in the written law, and not elsewhere" (Cooley's *Principles*, p. 131).

Each federal court has attached to it a United States marshal, to carry out its decisions, and he can call on good citizens for help, and, if necessary, apply to Washington to obtain the aid of the federal troops.

On the somewhat complicated point as to the relation of federal and State law, Mr. Bryce says (*The American Commonwealth*, first ed., pp. 247, 248):

"The United States is a federation of commonwealths, each of which has its own constitution and laws. The Federal Constitution not only gives certain powers to Congress, as the national legislature, but recognizes certain powers in the States, in virtue whereof their respective peoples have enacted fundamental State laws (the State constitutions) and have enabled their respective legislatures to pass State statutes. However, as the nation takes precedence of the States, the Federal Constitution, which is the supreme law of the land everywhere, and the statutes duly made by Congress under it, are preferred to all State constitutions and statutes; and if any conflict arise between them, the latter must give way. The same phenomenon therefore occurs as in the case of an inconsistency between the Constitution and a congressional statute. Where it is shown that a State constitution or statute infringes either the Federal Constitution or a Federal (*i.e.*, congressional) statute, the State constitution or statute must be held and declared invalid. And this declaration must, of course, proceed from the courts, not solely from the Federal courts; because when a State court decides against its own statutes or constitution in favor of a Federal law, its decision is final.

"It will be observed that in all this there is no conflict between the law courts and any legislative body. The conflict is between different kinds of laws. The duty of the judges is as strictly confined to the interpretation of the laws cited to them as it is in England or France; and the only difference is that in America there are laws of four different degrees of authority, whereas in England all laws (excluding mere by-laws, Privy Council ordinances, etc.) are equal because all proceed from Parliament. These four kinds of American laws are:

1. The Federal Constitution. 2. Federal statutes. 3. State constitutions. 4. State statutes.

"The American law court therefore does not itself enter on any conflict with the legislature. It merely secures to each kind of law its due authority. It does not even preside over a conflict and decide it, for the relative strength of each kind of law has been settled

already. All the court does is to point out that a conflict exists between two laws of different degrees of authority. Then the question is at an end, for the weaker law is extinct."

This leads us to the important point of

II. THE SUPREME COURT AND THE CONSTITUTION.

The Constitution of the United States is above the power of Congress to change. It was ratified and made binding not by Congress, but by the people, and can, therefore, be amended only by the people (see AMENDMENTS TO THE CONSTITUTION) in appointed ways—a most difficult and slow process. Congress can, therefore, legislate only subject to the limits the Constitution sets. The Tenth Amendment to the Constitution, adopted in 1791, distinctly says: "The powers not delegated to the United States by the Constitution nor prohibited by it to the States are reserved to the States respectively or to the people."

Now, according to the Constitution, the body that finally decides what is constitutional is the Supreme Court. Any law that the Supreme Court decides unconstitutional is illegal. This gives the Supreme Court enormous power. After long debate Congress recently passed an income tax (*g.v.*), and there is no question that such a tax was desired by a large majority of the people; but the Supreme Court decided by one vote that the bill was unconstitutional, and the bill did not become law. In such a case a single

Dangerous Power.

corrupt judge could subvert the will of the whole people save as by slow process the Constitution is amended. This to an extent makes the judiciary supreme over Congress and the Executive, and (except by the slow process of constitutional amendment) to a degree supreme over the people. It is true that the Supreme Court does not formally act on legislative bills—its power is only one of interpretation. It simply decides the individual case brought before it according to the law, and where laws conflict, according to the highest law, that is the Constitution; but this practically enables it to pass upon any bill enacted by Congress. And this power of interpretation is the greater for two reasons: 1. That

Danger.

a wrong decision is not easily reversed. In England, if the courts find that a law means what the people do not desire, the law can easily be amended. In the United States, a wrong interpretation of the Constitution is most difficult to reverse. 2. The Constitution, being of necessity brief, the opportunity for interpretation is very broad. Hence in practice the Supreme Court has enormous power. It is true that this power has not been frequently corruptly used. The Supreme Court has not by many been considered venal or even unfair; but the trouble is that the people often have more to fear from just decisions than unjust. A decision flagrantly unjust or venal could be more easily reversed; but a just decision that the Constitution does not allow of a certain measure is difficult to reverse, even tho the whole people desire it. Yet to Democrats at least, what the large majority desire

ought to be legal. Legislation ought to belong in usufruct to the living. A free people ought not to be fettered by a Constitution enacted a century ago under conditions utterly different from the present. Yet if the Supreme Court decides a bill unconstitutional, it cannot hold, no matter what the people will, save by slow process of amendment; and the more honest the judges are the more difficult to change the decision. In cases where a United States official, like the President, deems that the Supreme Court has made a mistake in the interpretation of the Constitution, it has been claimed that he must follow the best judgment he has and disobey the Supreme Court, since, in his judgment, to obey the Court would violate the Constitution he is first of all bound to obey. President Jackson attacked the United States Bank as illegal, tho the Supreme Court had decided it legal. Jefferson denounced a judgment of Chief Justice Marshall. Majorities in Congress have claimed the same right; but recently both executive and legislative have receded from claiming this right, and certainly in case of a just decision it would be impossible to disobey it on this ground.

The Constitution does not limit the number of Supreme judges, and some claim that the will of the people could be realized by appointing judges who would decide that the will of the people was constitutional; but such a procedure would be looked upon as revolutionary by many, if not by most. The seriousness of this feature of the Constitution cannot, therefore, be easily exaggerated. It is true that thus far no great evils have seemed to arise. John Fiske says of the Supreme Court (*Civil Government in the United States*, p. 252):

"It is peculiarly American, and for its exalted character and priceless services it is an institution of which Americans may well be proud."

Mr. Bryce says (*The American Commonwealth*, first ed., pp. 406, 407):

"The rigid Constitution of the United States has rendered and renders inestimable service. It opposes obstacles to rash and hasty change. It secures time for deliberation. . . . It forms the mind and temper of the people. It trains them to habits of legality. . . . It familiarizes them with it, attaches them by ties of pride and reverence to those fundamental truths on which the Constitution is based."

And again (p. 271):

"The credit and dignity of the Supreme Court stand very high. No one of its members has ever been suspected of corruption, and comparatively few have allowed their political sympathies to disturb their official judgment."

But in spite of this favorable view two things must be remembered: (1) that the longer the country moves from the conditions when the Constitution was framed, the more must its requirements fetter and be unsuited to the needs and wishes of the people; (2) the more political questions turn upon industrial and financial questions, the more likely is the Supreme Court to be out of touch with the masses of the country. Almost of necessity the Supreme judges must come from the class of the most educated, the most successful, the most wealthy; this must be so almost inevitably from the nature of the case; almost inevitably, therefore, with the

best of will, they must judge from their environment, their education, their experience. Whether they will understand the common people is, therefore, especially in industrial matters, at least questionable. Without, then, the slightest reflection on the purity of the Supreme Court, its power under the Constitution is open to the gravest question. It is not necessary. In England it is not so. In England, Magna Charta, the Bill of Rights, the Act of Settlement, the Acts of Union with Scotland and Ireland are merely ordinary laws which can be repealed by Parliament at any moment. There is no Constitution superior to the Legislature. All laws are made by the Legislature and all can be repealed by it; nor is the institution necessary even to a republic.

Says Mr. Bryce (*The American Commonwealth*, pp. 259, 260):

"The case of Switzerland shows that the American plan is not the only one possible to a federation. The Swiss Federal Court, while instituted in imitation of the American, is not the only authority competent to determine whether a cantonal law is void because inconsistent with the Federal Constitution, for in some cases recourse must be had not to the court but to the Federal Council, which is a sort of executive cabinet of the confederation. And the Federal Court is bound to enforce every law passed by the Federal legislature, even if it violate the Constitution. In other words, the Swiss Constitution has reserved some points of cantonal law for an authority not judicial, but political, and has made the Federal legislature the sole judge of its own powers, the authorized interpreter of the Constitution, and an interpreter not likely to proceed on purely legal grounds."

Some radicals believe that the cure for America lies in one constitutional amendment giving to Congress the power of action, within certain limits, without reference to the Constitution. A large number find the cure in the adoption of the referendum (*q.v.*).

III. STATE JUDICIARY.

The judiciary in every State includes three sets of courts: A supreme court or court of appeal; superior courts of record; local courts; but the particular names and relations of these several tribunals and the arrangements for criminal business vary greatly from State to State. We hear of courts of common pleas, probate courts, surrogate courts, prerogative courts, courts of oyer and terminer, orphans' courts, court of general sessions of the peace and jail delivery, quarter sessions, hustings' courts, county courts, etc.

The jurisdiction of State courts is complete. There is no appeal to federal courts except on matters pertaining to federal law. Each State recognizes the judgments of the courts of a sister State, gives credit to its public acts and records, and delivers up to its justice any fugitive from its jurisdiction charged with a crime. Of course the courts of one State are not bound either by law or usage to follow the reported decisions of those of another State. They use such decisions merely for their own enlightenment, and as some evidence of the common law, just as they use the English law reports. Each State makes its own law, and these laws vary enormously not only between States, but also from time to time. Judges in 1894 were

elected by the people in 31 States, by the legislatures in 5, and appointed by the Governor, with the consent of a legislature or council, in 8 States, namely, in New England and the older States. In New York and Pennsylvania they are elected. In 4 States they are elected for life; in others for terms varying from 2 years, in Vermont, to 21 years, in Pennsylvania—8 to 10 years is the average. Salaries for the higher courts vary from \$10,000, in New York, to \$2000, in Oregon.

Concerning the purity of the State judiciary, Mr. Bryce says (*The American Commonwealth*, p. 507):

"Any one of the three phenomena I have described—popular elections, short terms, and small salaries—would be sufficient to lower the character of the judiciary. Popular elections throw the choice into the hands of political parties—that is to say, of knots of wirepullers, inclined to use every office as a means of rewarding political services, and garrisoning with grateful partisans posts which may conceivably become of political importance. Short terms . . . oblige the judge to remember and keep on good terms with those who have made him what he is, and in whose hands his fortunes lie. . . . Small salaries prevent able men from offering themselves for places, whose incomes are perhaps only one tenth of what a leading barrister can make by private practice. . . . The mischief is serious, but I must own that it is smaller than a European observer is prepared to expect."

The reasons given for this lack of the worst results Mr. Bryce considers the presence in every State of federal tribunals, the power of public opinion, and lastly the power of the professional influence of the bar. Mr. Bryce said in the first edition of his book, vol. ii., p. 501:

"In a few States, perhaps six or seven in all, suspicions have at one time or another within the last 20 years attached to one or more of the superior judges. Sometimes these suspicions may have been ill-founded."

"In one State, viz., New York, in 1860-71, there were flagrant scandals which led to the disappearance of three justices of the superior courts who had unquestionably been sold and denied justice. The Tweed Ring, when masters of New York City and engaged in plundering its treasury, found it convenient to have in the seat of justice accomplices who might check inquiry into their misdeeds. This the system of popular elections for very short terms enables them to do; and men were accordingly placed on the Bench whom one might rather have expected to see in the dock—bar-room loafers, broken-down Tombs attorneys, needy adventurers whose want of character made them absolutely dependent on their patrons."

(For further facts, however, as to corrupt courts, see PLUTOCRACY; STANDARD OIL MONOPOLY.)

Lawyers in the United States, differently from those in Europe, are allowed to plead in any court they will. Almost absolute liberty is given. The result is an intense competition, and not unfrequently a low tone for the profession.

This freedom allows of great injustice to the poor. Judgments are often pronounced, not upon absolute equity, but upon whether the accused has been proven in

The Bar. court to have violated a law. Especially where the laws are as involved as in the United States, a shrewd lawyer, unless opposed by one equally shrewd, can find some loophole in the law for almost any client, at least in civil practice. A wealthy corporation can afford to employ the shrewdest counsel. The poor usually cannot. Therefore the poor are usually in such cases helpless. Of the injustice of this to the poor

we speak in the next section. Of its effect upon the lawyers we speak now. It means that in most cases success for the lawyer lies in shrewdly defending or serving the interests of the great Corporation corporations, as the railroads, etc. **Lawyers.**

To do this requires of necessity no actual dishonesty, but simply the development of ability to see shrewd ways of avoiding or using the requirements of law. The average successful lawyer is the corporation lawyer. He becomes unconsciously accustomed to viewing things not from the standpoint of equity, but of shrewd interpretation in favor of his corporation. This is what he is paid to do. Involving at first at least no absolute dishonesty, it leads too often to a blunting of the moral sense. Even where this does not result, by his interests, his ambitions, his associations, his professional instinct, above all, his social environment, he becomes honestly the partisan of the corporation. He goes into the Legislature and finds there abundant opportunity to serve his former clients, and by his training is led even unconsciously to do so. The financial prizes in this line are very large. Corporation lawyers, in what is considered perfectly legitimate practice, can make as much as \$100,000 a year, while \$50,000 is not infrequent. With 89,000 lawyers in the United States in 1890 competing for these prizes, many of them poor, the temptation to rise by serving the interests of wealth becomes well-nigh irresistible. A very few succeed by championing the cause of labor, but usually they lose professional and social caste, so that many who for political reasons might choose the side of the poor are deterred by family and social claims. Under these circumstances, without the necessity of implying any unusual corruption on the part of the lawyers, the people are, not without reason, growing suspicious of corporation attorneys, and particularly of their presence in legislatures, where, however, they form the large majority, in the House of Representatives, for example, being about 70 per cent. of the whole number. (See DIRECT LEGISLATION.) We come, then, to consider

IV. THE MISCARRIAGE OF JUSTICE AND ITS REFORM.

The miscarriage of justice in modern courts is not mainly due to unjust judges or corrupt lawyers, but to the present judicial system. Professor Ely writes in the *Christian Advocate*:

"Perhaps no current phrase is more frequently heard than that all men are equal before the law. It belongs to a class of phrases which cover facts and prevent thought. Nothing could be further from the truth, for it is possible to mention at least six respects in which legal inequality exists to-day in the United States.

"1. All men are supposed to be familiar with the law, and ignorance of the law excuses no one. How, then, can we talk about the equality of the law, when the law is so complicated, and only few can know it? In addition to the comparatively few who can know it, there are a few wealthy individuals and corporations who can employ well-trained experts in the law to inform them of the law in so far as it is important for them to know it. Compare the situation in this respect of a great railway corporation and a labor organization with which it may be engaged in conflict. It is not at all unlikely that some of the officers of the corporation may themselves be trained lawyers, receiv-

ing salaries of from \$5,000 to \$25,000, and in addition to this the corporation is certain to have in its constant employment attorneys receiving high salaries, and who give advice upon every step taken. The counselors of the corporation are familiar with every twist and turn of the law, and know the purport of conflicting judicial decisions, so hard for the ordinary man to understand. The highest salary ever received by an officer of a labor organization was \$5,000, and it is believed that at the present time no one receives over \$3,000. No labor organization can keep in its constant employ able

Expense of Litigation.

attorneys, for, on the one hand, it cannot pay sufficiently high salaries to secure the best talent, and, on the other, the position of attorney for working men is not calculated to lead to further advancement. . . .

"2. The law affords very unequal protection to the rich and to the poor. The avenues of justice are in one way and another closed to the poor and ignorant. If ignorance itself of the proper method of securing redress is not a sufficient barrier, fees of one kind and another and heavy court charges deter the poorer members of the community from seeking justice at law. When poor people have a case in the courts to protect them against their employers, or others with larger economic resources, the case may be delayed from time to time, may be appealed from one court to another, and it may be transferred from one jurisdiction to another. Railway corporations engaged in inter-state commerce like to transfer cases to the United States courts, and thus they can put their antagonists to the expense of long journeys. These are some of the ways by means of which the resources of the poorer party can be exhausted and justice defeated. Often the poor man does not know how to take the first step to secure justice, and when he takes the first step it often happens that he is exhausted before he can take the last one.

"The secretary of the Chicago Bureau of Justice, to which reference has already been made, in his second annual report speaks about the inaccessibility of the means of legal redress for wage-earners, and generally for the poorer members of the community. He says that it is necessary that the fee system should be abolished, both in so far as it relates to justices of the peace and to constables.

"3. We must consider the inequality of the law itself. The law in the United States is not so framed expressly that an offense committed by an employer or a rich man receives one kind of punishment, and the offense committed by an employee or a poor man receives a different kind of punishment, but the penalties are so framed that they bear with unequal severity upon the various social classes, and thus offenses apt to be committed by the rich are not likely to be visited by such heavy penalties as those to which the poorer people are specially liable.

"I am glad to be able to quote so good an authority, a man so highly esteemed, as the late Josiah Quincy, who in his *Figures of the Past* thus describes one kind of legal inequality: 'It is no disrespect to the majesty of the law to maintain that it has not yet sloughed off all its barbarisms. So long as a punishment of a money fine is accepted from the rich, and the alternative imprisonment is exacted from the poor, the equality of all men before the law is but a sounding phrase.'

"4. We have under the next heading to notice the unequal administration of even equal law. The devices which are open to those who can employ the best legal counsel for escaping the penalties of the law on the one hand, and for bringing them to bear heavily on opponents on the other hand, are well known to all.

Again, I am glad to be able to make a quotation in order to have additional confirmation of my position, altho I think no honest and well-informed man will attempt to dispute it. It excited no surprise a few years ago when Mr. Walling, ex-Superintendent of Police of New York City, said: 'Altho, of course, all things are possible, yet I would not count as among probable contingencies under the present system of government in New York the hanging of any one of its millionaires, no matter how unprovoked or premeditated the murder he might have committed.'

"Many examples of unequal administration of the law can be given—in fact, so many that it seems almost absurd to mention any concrete cases. Nevertheless, I will give one or two illustrations in order to direct the thought of my readers, and to lead to further observation on their part. Railways are again instructive. A few years ago a terrible accident oc-

curred in Massachusetts. The railway directors had disregarded the express recommendations of the railway commissioners of Massachusetts to test the safety of the bridge properly. There were no automatic brakes, and there were not so many brakemen as the law requires. A prominent paper of New York of high standing said that the case was clearly one of a preventable accident, and that it was deemed in law criminal negligence. The writer of the editorial stated that the parties responsible could be indicted and punished, and suggested that an example of punishment would teach railway managers a useful lesson. Is it necessary to tell my readers that no attempt was made to enforce the law? Every reader knows it before I state it, and he knows, furthermore, that the law in such cases is not likely to be enforced. Suppose, on the other hand, that the leaders of a great labor organization, in their desire to raise wages, or for any pecuniary reasons, should take a course resulting in loss of life, is there one of my readers who does not know that the law would lay a very heavy hand on these labor leaders? It happened not long ago that certain directors of a great corporation were indicted for an accident which resulted in a horrible death of passengers. How tenderly and considerably they were treated when they were brought before the court was described by the daily press, and the bail was fixed at \$5,000, a mere nothing for men of vast wealth. About the same time a labor leader was indicted in New York for conspiracy and extortion. This leader was at the time in Pennsylvania, and bail was at first altogether refused, and finally was fixed at \$20,000, an enormous sum for such a person, probably more than he and a half dozen of his best friends together were worth.

"Taxation reveals another kind of unequal administration. The property of the rich is rarely assessed at so high a relative rate as the property of the poor.

"5. A fifth kind of legal inequality is seen in the failure to provide laws needed by the masses when contrasted with the readiness to provide laws needed by the few rich, especially powerful corporations. . . .

"6. The last kind of legal inequality relates to the use of more or less corrupt means for defeating the ends of justice. These means, which of course should not exist at all, are accessible only to the few. Jury bribing is one, but that is coarse and clumsy. There are many more refined processes. A friend of mine was employed in a large law office which was concerned especially with railway cases. He tells me that the lawyers in this office secure a list of all names on the jury list in all places along the line of the railway for which they are attorneys. They found out before cases were tried the personal opinions in regard to railways of every single man who could be drawn for jury service, and they challenged the names of those who were regarded as unfriendly to railways. He said that it thus becomes impossible for any one to recover damages. I will mention only two other devices under this head. One is through influence with the appointing power to secure the appointment of judges friendly to railway interests where judges are appointed, and through influence with politicians to secure the nomination of judges by both parties favorable to these same interests."

Concerning the reforms of the judiciary, various proposals have been made. Extreme individualists and anarchists would abolish all courts of government authority. According to Mr. Bryce, there are parts of the United States even now where

Reforms Proposed.

the people have deliberately concluded that it is cheaper and simpler to take the law into their own hands on those rare occasions when a police is needed than to be at the trouble of organizing and paying a force for which there is usually no employment. Their method is a volunteer jury, and, in a clear case, a simple seizure and execution of the criminal.

Mr. W. M. Salter (*Anarchy or Government*, p. 22) gives the following interesting instance:

"A few years ago there died in a little town in Iowa a remarkable man named Thomas Chilson. He was a blacksmith, but was crippled by an accident, and in time such qualities were discovered in him that his

fellow-townsmen and the farmers around used to come to him to have him settle their disputes. For years previous to his death it was not uncommon to see in front of his modest dwelling the motley collection of vehicles which is a familiar spectacle in the vicinity of a rural court-house. Inside, gathered about the cripple's chair, were the litigants, their respective witnesses, and as many curious spectators as were able to get within hearing distance. His judgments, it is said, were almost invariably respected. The people in the neighborhood became thus accustomed, instead of 'going to law,' to 'going to Chilson,' the process being a great deal cheaper, costing nothing in fact, and the results being much more satisfactory.

"Such an instance raises the query whether it would not be well to have it always possible for private enterprise to compete with government? The idea may be impracticable (Chilson, I believe, dealt only with civil cases), and yet it has something to recommend it."

Socialists, on the other hand, believe that with human nature as it is, and in the involved conditions of civilized existence, such voluntary courts are utterly impracticable. The ultimate appeal must be to Lynch law; and they cannot believe that, when appearances and true facts are often so utterly different, it is safe to trust judgment to the hasty feelings of the community. (See LYNCH LAW.) They would have all justice in the hands of the community organized as a State, but make justice absolutely free. If it be argued that this would enormously increase litigation, they reply that, if justice were free, any one could get justice, and trespassers would be afraid to commit wrong. To-day, they argue, the wrongdoer, especially the rich corporation, can commit wrong almost with impunity. Under free justice, with judges and lawyers paid by the State, wrongdoing, socialists claim, would be reduced to a minimum. Less radical propositions are to procure cheap justice by the organization of popular courts of conciliation (*q. v.*), as in Denmark.

JUKES, THE, is the name of a poor family whose genealogy was investigated by Mr. R. L. Dugdale as a study in heredity, etc., and the results of which investigation he recorded in his book *The Jukes*.

Mr. Dugdale traces the family back to a man whom he calls Max, a descendant of the early Dutch settlers, and born between the years 1720 and 1740. He is described as a hunter and fisher, a hard drinker, jolly and companionable, averse to steady work, tho working hard by spurts, and becoming blind in old age and entailing this blindness upon his children and grandchildren. Two of his sons married Juke sisters, of whom there were six in all. The progeny of five of these sisters is traced with more or less exactness through five generations. The total lineage Mr. Dugdale calculates reaches over 1200 persons, but he traces only 709, of whom 540 were related by blood to the Jukes and 169 were connected with them by marriage or cohabitation. The latter class Mr. Dugdale classes under the head of X. The descendants of one of the women, Ada Juke, proved so unworthy that she is often referred to as Margaret, the mother of criminals. According to Mr. Dugdale's table (p. 69), of the 540 of Juke blood, 305 reached marriageable age. Of these 82 were illegitimate; 73 were prostitutes, 58 unascertained; 12 kept brothels, 51 had syphilis; 15 acquired property and 5 lost it; 95 received

outdoor pauper relief, 53 almshouse relief; 49 were criminals. Of the X blood (169 of marriageable age), 9 were illegitimate, 55 prostitutes, 23 unascertained, 6 kept brothels, 16 had syphilis, 7 acquired property and 3 lost it; 47 received outdoor relief and 11 almshouse relief; 27 were criminals. This shows that of the adult Juke women, 52.40 per cent. were harlots, tho some lines of the family were more criminal than others. Their environment was in rural New York at a time when to others equally circumstanced success was entirely possible. At the same time it cannot be said that all this is due to heredity, because the "tendency of heredity is to produce an environment which perpetuates that heredity." A child born on the roadside or in a pauper asylum is likely to be brought up as a pauper. Mr. Dugdale estimates that the family cost the community in 75 years over \$1,250,000, without reckoning the cash paid for whisky and the crime, disease, and pauperism left to ensuing generations. Mr. Dugdale says: "Fornication, either consanguineous or not, is the backbone of their habits, flanked on the one side by pauperism, on the other by crime." Such is the evil record, tho its evil has been exaggerated by many who have referred to it.

JURY, TRIAL BY, often called the "palladium of our civil and political liberties," is considered by many to-day to have been changed from its original form as to have become a hindrance rather than a help to justice, and to be in need of radical reform. A jury to-day may be defined as a body of men selected according to law and sworn to inquire into or to determine facts concerning a cause or an accusation submitted to them, and to declare the truth according to the evidence adduced. A "grand jury" is a jury of not less than 12 or over 23 men, of whom 12 must agree, to decide whether there is sufficient ground of suspicion to justify trial before a jury, which, as compared with the grand jury, is called a "petty" or "petit jury." A "coroner's jury" is a jury summoned by a coroner to investigate the cause of a death.

The origin of the jury is in the remote past. Says Canon Stubbs:

"Many writers of authority have maintained that the entire jury system is indigenous in England, some deriving it from Celtic tradition based on the principles of Roman law, and adopted by the Anglo-Saxons and Normans from the people they had conquered. Others have regarded it as a product of that legal genius of the Anglo-Saxons of which Alfred is the mythic impersonation, or as derived by that nation from the customs of primitive Germany or from their intercourse with the Danes. Nor even when it is admitted that the system of recognition was introduced from Normandy have legal writers agreed as to the source from which the Normans themselves derived it. One scholar maintains that it was brought by the Norsemen from Scandinavia; another that it was derived from the processes of the canon law; another that it was developed on Gallic soil from Roman principles; another that it came from Asia through the crusades. The true answer seems to be that forms of trial resembling the jury system are to be found in the primitive institutions of all nations."

The jury, however, in modern forms was mainly developed in England. Some have claimed that originally it was not what it is to-day. Mr. Lysander Spooner, in his *Trial by Jury*, published in 1852, argued that the present jury trials are illegal and unconstitutional, and

that the establishment of the true original system would not only at once cause the total disappearance of the evils complained of, but would also certainly result in a general purification and elevation of the art of politics and the business of government.

History.

According to Mr. Spooner, "the trial by jury is a trial by the country, by the people, as distinguished from a trial by the Government." Anciently it was called trial *per pais*—that is, trial by the country. And even to-day, in every criminal court the jury are told that the accused "has, for trial, put himself upon the country, which country you (the jury) are." The object of this trial, by the country, in preference to a trial by the Government, is *to guard against oppression by the Government.* He says :

"Since Magna Charta, in 1215, there has been no clearer principle of English or American constitutional law than that in criminal cases it is not only the right and duty of juries to judge what are the facts, what is the law, and what was the moral intent of the accused, but that it is also their right and their primary duty to *judge of the justice of the law*, and to hold all laws invalid that are in their opinion unjust or oppressive, and all persons guiltless in violating or resisting the execution of such laws."

According to Mr. Spooner, "if, after hearing both sides, the jury declare that the Government is right, the accused become criminals and are liable to punishment. If they declare the Government wrong, the accused walk out free and honorable men, and the law in question becomes null and void.

But this "trial by the country" would be a sham, a delusion, and a snare if the Government could say either who may and who may not be jurors, or could dictate to the jury anything whatever either of law or evidence. In short, to use Mr. Spooner's words :

"The jury must judge of and try the whole case, and every part and parcel of the case, free of any dictation or authority on the part of the Government. They must judge of the existence of the law; of the true exposition of the law; of the justice of the law; and of the admissibility and weight of all the evidence offered. Otherwise, the Government will have everything its own way, the jury will be mere puppets in its hands, and the trial will be in reality a trial by the Government."

That the trial by jury was originally this, Mr. Spooner claims to be proved by the history and the language of Magna Charta.

At the time of Magna Charta the king was constitutionally almost the entire government, the sole legislative, judicial, and executive power. The officers were merely his servants, appointed by him and removable at his pleasure. The only legal limitation upon his power was the "law of the land," or the common law, which he was bound by oath to maintain. But the oppressions and usurpations of King John were so intolerable that the whole nation finally made war upon the king and compelled him to pledge himself that he would punish no man for the violation of any law except with the consent of the equals of the accused. Thus the Great Charter of English Liberties was granted. This charter took the liberties of the people out of the hands of the king and placed them in the keeping of the people themselves.

Whether Mr. Spooner's view of the past be cor-

rect or not, there is no question that the custom is different to-day. To-day the province of the jury is to judge of facts; they have nothing to do with the law—which they must take from the presiding judge at the trial. The old *decantatum* assigns to each his own independent function: "Ad quæstionem legis judices respondent, ad quæstionem facti juratores."

From the beginning parties have been allowed to *challenge* the jury. In civil and criminal cases a challenge *for cause* is allowed; in criminal cases only, a peremptory challenge is also allowed. A challenge to the array is either on the ground that the sheriff is a party to the cause or related to one of the parties, on the ground of circumstances implying "at least a probability of bias or favor in the sheriff." A challenge to the polls is an exception to one or more jurymen on either of the following grounds: (1) *propter honoris respectum*, as when a lord of Parliament is summoned; (2) *propter defectum*, for want of qualification; (3) *propter affectum*, on suspicion of bias or partiality; and (4) *propter delictum*, when the juror has been convicted of an infamous offense.

Unanimity in the jury is essential to conviction.

Such is the English procedure, and it is substantially the same in the United States.

In France, there is no grand jury, and unanimity is not necessary.

To-day, however, dissatisfaction with the system is widespread. It is argued that the law to-day allows only fools who have no opinions to be jurors, and does not allow conviction if a sharp lawyer can bulldoze or a culprit can bribe one of the jury not to vote guilty.

Men are but too anxious to escape jury duty, and the excuse of "prejudice" is so simple that they seize upon it with the greatest avidity. Thus the men who would make excellent jurors escape by pleading bias, while those who are actuated by unworthy motives and who are anxious to enter the jury box glibly assert their perfect freedom from all bias, and virtually beg the court to accept them.

Many propositions for reform have been made, among them the abolition of the requirement of unanimity in jury verdicts and the substitution of a majority verdict; the doing away with the examinations of talesmen as to their "opinions" about the case; the abatement of the exemption abuse, and the improvement of the methods of selecting and drawing names for the first jury list. (For more radical propositions, see JUDICIARY, last section.)

JUVENILE REFORMATORIES.—According to the census for 1890, the following are the statistics of juvenile reformatories :

Total number of inmates in reformatories in 1890.....	14,846
Total number of inmates in reformatories in 1880.....	11,468
Increase in the decade.....	3,378
Number of males, white.....	9,998
Number of males, colored.....	1,537
Number of females, white.....	2,905
Number of females, colored.....	400
Number of native born, white.....	11,073
Number of foreign born, white.....	1,405
Number with nativity unknown.....	420

Number of native-born white with parents native	3,245
Number of native-born white with parents foreign	3,965
Number of native born white with one parent foreign	963
Number of native-born white, nativity of parents unknown	2,905

The increase from 1880-90 was 29.46 per cent. The increase in the total population was 24.86 per cent. In 1880 the ratio of juvenile delinquents confined in reformatories to the population was 229 in each million; in 1890 it was 237; the increase, therefore, has been only 8 to the million. The largest increase has been in the North Central division, where it was 61 to the million. In the South Atlantic and Western divisions it was 24 to the million, but in the North Atlantic and South Central divisions there has been a relative decrease, in the former of 44 and in the latter of 10 to the million. In the

South Central division there has been an absolute decrease of 28 in the number of inmates of this class of institutions. It is evident from these figures that the juvenile reformatory system is not growing rapidly.

The following table shows the nature of their offenses :

	OFFENSES AGAINST—				Miscellaneous.
	The Government.	Society.	The Person.	Property.	
Boys	18	5,222	291	4,169	1,835
Girls	1,708	17	346	1,240

K.

KAUFMANN, MORITZ.—Born in Germany, he early went to Ireland, and graduated at Trinity, Dublin. Taking orders in the Church of England, he became rector of Ingworth and vicar of Calthorpe. He has been a lifelong student of socialism, and has written numberless magazine articles and accounts of socialism, with several books, such as *Socialism: its Nature, its Dangers, and its Remedies Considered* (1874); *Utopias from Sir Thomas More to Karl Marx* (1879); *Christian Socialism* (1888); *Charles Kingsley, Christian Socialist and Social Reformer* (1892).

KAUTSKY, KARL, a leading German socialist, was born in 1854. He is now editor of *Die Neue Zeitung* of Stuttgart, the leading German socialist review, and also, with E. Bernstein, of *Die Geschichte der Sozialismus*, now appearing in parts. He has been a voluminous writer. Among his books are: *Thomas More und seine Utopie*; *Der Arbeiterschutz, besonders der internationale Arbeiterschutz*; *Gesetzgebung und der Achtstundentag*; *Die Klassengesetze von 1789*; *Karl Marx, Oekonomische Lehren, Das Erfurter Programm in seinem grundsätzlichen Theil*; *Der Parlamentarismus, die Volksgesetzgebung und die Sozialdemokratie*.

KAWEAH was a cooperative colony located in Tulare County, Cal. In 1884 a number of Californians decided to form a cooperative colony or community, and after examining different sites, in October, 1885, filed their claims, 45 in number, to some Government land near the Kaweah River, under the Timber Act of June 3, 1878. The Act provides for a probationary period of 60 days "for the sole purpose of permitting adverse claims, if any, to be filed." Before the end of this period Land Commissioner Sparks ordered a suspension of their claims, on the ground that he doubted if they were *bona fide* settlers, land at that time being continually obtained by monopolies by setting up claims for dummy settlers.

The colonists, however, conscious that they were *bona fide* settlers and had acted legally every way, believed that in due time their claim must be acknowledged, and refused to spend any money in Washington to push it. They went ahead rather, opening up the land and building a road 18 miles long through land the timber companies had considered inaccessible, and by 1890 were prepared to haul lumber for the market. Their claims, meanwhile, dragged along uncompleted. The colony was organized on a cooperative plan in August, 1886. Shares were \$500, one fifth of which had to be paid before residence was allowed. A socialistic paper was published. All went reasonably well till 1890. Then at least, as the colonists believe, the timber companies of California, fearing their competition, plotted their overthrow. A bill was hurried through Congress on the last day of its session, October 1, 1890, reserving land for Yosemite National Park, and including in it the land the colonists had taken up and had improved for five years. Stories were circulated that the colonists were cutting down the big trees of the Yosemite, which, tho near the colony, the colonists had not touched, and offered to guarantee not to touch. The colonists claimed that they had legally entered their claims, that judgment on them had been suspended only to be sure that they were *bona fide* settlers, and that since this was the case, they could not be dispossessed except by eminent domain, with compensation. They were, however, dispossessed. The trustees were accused of illegally cutting down five trees which the colonists argued they had done legally. The papers where the trial took place were filled with editorials against the socialistic leaders, and they were condemned to pay \$300 each for cutting down five trees. Appeal was taken.

On February 25, 1891, Lewis A. Groff, Land Commissioner at Washington, submitted to Secretary of the Interior Noble a full and elaborate report concerning the title of the colonists to their lands, in which the commissioner maintains that the colonists had faithfully complied

with every requirement of the land laws, and shows that the General Land Office was possessed of no legal reason why their patents should not be at once issued.

But, in spite of this report, Secretary Noble rendered a decision in which he ordered the colonists' entries to be canceled, on the ground that as their titles were not *perfected* they had no rights against the United States Government, and for the reason that "Congress, in the exercise of its authority, has made other and final disposition of the lands."

He said: "Since the very inception of certain of these claims to the lands in question in October, 1885, it has been asserted that the same were fraudulent, and it must be assumed that Congress acted with a full knowledge of all the facts in the case; at all events, its action in disposing of the lands is final."

The colony, already financially hurt, was broken up by this decision.

KETTELER, WILHELM EMANUEL FREIHERR, von, was born at Münster in 1811; he was educated there, and under the Jesuits at Brug, and at the universities of Göttingen, Heidelberg, and München. He entered the public service as "Referendar" from 1834-38, but siding with the Church against the State, he studied under Döllinger, and was ordained priest in 1844. Located at Mayence, he was very popular and untiring in his work in his parish, especially during an epidemic, and was elected to the Germanic Parliament at Frankfurt. In 1848 he preached at Mainz on social subjects to five or six thousand people, and in 1850 was made Bishop of Mainz. He was untiring in his devotion to his people. He started various church associations for working men, and is considered the founder of the Catholic socialism of Germany, a movement which, tho of some size and political influence, is, however, quite different from English Christian Socialism.

Acquainted with and perhaps influenced by Lassalle, von Ketteler's ideas were in many points radically socialistic, tho always from a church standpoint, and conceiving of all social reforms as to be carried out under the patronage of the church. Bishop von Ketteler's main published work is *Die Arbeiterfrage und das Christentum*. He died in 1875. (See CHRISTIAN SOCIALISM.)

KIDD, BENJAMIN, was born in England in 1858. He left school at the age of 17 and read under private tutors, first for the Indian civil service and later for the Chinese consular service, obtaining, in the mean time (1877), an appointment in the home civil service, London. In the course of his reading he became deeply interested in biology and made this a specialty, having colonies of ants and bees in his study, and following closely all work in the leading departments of biology. As a result, tho keeping his civil service appointment, he did not go abroad, but devoted his time out of office hours to biology. He has followed closely the Weismann controversy, and has believed from the first that it bore directly on sociological subjects. He has been a frequent contributor to the magazines, tho not always over his name,

his articles appearing in *The Nineteenth Century*, *Review of Reviews*, *The English Illustrated*, *Cornhill*, *Longman's* and other magazines. His book, *Social Evolution* (1894), aroused remarkable interest. It argues that progress inevitably depends on natural selection and the struggle for existence, and that socialism, arising from the short-sighted working-class opposition to this struggle, cannot endure, but will end in increased State activity, not in owning or conducting industry, but in insuring competition by preventing all monopolies. Religion, he believes, has played a large part in civilization, by its superrational sanctions teaching an altruism the effect of which has been to lift up the weaker portion of the community to a place where they can more effectually compete with the stronger. (See BIOLOGY; EVOLUTION.)

KINDERGARTEN is the German name (meaning "garden of children") given by Friedrich Froebel (*q. v.*) to the "play school" invented by him for furthering the physical, moral, and intellectual growth of children. Froebel's observation of nature and his fondness for analogies drawn from trees and plants made him attach especial importance to the early years of childhood.

Pestalozzi, Comenius, and others, who attached much importance to the first years of life, looked to the mother as the sole educator. But, as in the case of the poor, the mother might not have time to attend to her children. Pestalozzi planned and Oberlin formed day asylums for young children. Schools of this kind took in the Netherlands the name of "play school," and in England of "infant schools." Froebel's conceptions differed, however, materially from those of the infant schools. He held that children should be educated physically, morally, and intellectually at once; that the essence of all education was to be found in rightly directed but spontaneous action, that at their age the most suitable and natural employment was play, especially games in which to imitate the parts they themselves will have to fill in after years. Froebel agreed with Montaigne that the games of children were "their most serious occupations."

Froebel embodied his ideas of the means to be used in early child culture in the remarkable book, *The Mother Play and Nursery Songs*. This book he made the foundation of his lectures to kindergarten teachers. To the average reader **Principles**, the book may appear at first sight trivial and absurd, but whoever will study it with the key to its meaning will find in it a very profound philosophy. As to its meaning, the Baroness Marenholtz says: "The key-note of the book is the analogy between the development of humanity from its earliest infancy and the development of the individual."

Froebel wrote: "The development of the child requires the same series of steps in the child as the development of the human race—that is, it must be done as God Himself has conducted the education of the human race." But he adds: "We can spare our children the details of experiments which mankind has passed through if we educate them aright. They must,

indeed, become wise through their own experience, but they need less rough experience." He saw that the primitive man had been educated chiefly through symbols, "had needed and dwelt in symbols," and, therefore, Froebel held that the deepest need of childhood is to make the intellectual its own through symbols or sensuous forms.

To guide in the use of these means Froebel announces an educational law, and declares that his method stands or falls upon the recognition or the non recognition of it. This law is the law of unity.

In Froebel's writings, and in those of the Baroness Marenholtz, the law we are considering is sometimes spoken of, as the *law of the connection of opposites*, sometimes as the *law of contrasts and their connections*; it is also called the *law of harmony, the law of equilibrium*.

Such are the ideas at the base of Froebel's system, and which have been applied in modern kindergartens.

The first kindergarten was opened at Blankenburg, near Rudolstadt, in 1840, but after a needy existence of eight years was closed for want of funds. In 1851 the Prussian Government declared that

History.

"schools founded on Froebel's principles or principles like them could not be allowed." But the idea had far too much vitality to be starved or frowned down. As early as 1854 it was introduced into England by the then famous Ronges.

The great propagandist of Froebelism, the Baroness Marenholtz-Bülow, drew the attention of the French to the kindergarten from the year 1855, and Michelet declared that Froebel had "solved the problem of human education."

After 1872 the system spread rapidly, and is now more or less adopted in all European public school systems, especially on the Continent. It has been most developed, however, in the United States. In 1854 Mr. Henry Barnard, of Connecticut, declared it "by far the most original, attractive, and philosophical form of infant development the world has yet seen," and wrote about it in the *Journal of Education* in 1856. Soon after, Miss Elizabeth Peabody, of Boston, established the first kindergarten in this country. In 1871 an American Froebel Union was established in Boston, merged later into the Froebel Institute of North America, established by Mr. W. N. Hailmann in 1882, and to-day kindergartens exist in all portions of the country. (See EDUCATION.)

KINGSLEY, CHARLES, was born at Holne Vicarage, Dartmoor, Devonshire, in 1819. Educated first at private schools and at King's College, London, his father becoming rector of Chelsea, he entered Magdalen College, Cambridge, and graduated in 1842. He was the same year ordained curate of Eversley, in Hampshire, and this was his home through all his life. In 1848 he published his first work, a drama *The Saint's Tragedy*, and soon after *Twenty-five Village Sermons*. In 1849, stirred by the Chartist movement and by the sufferings which he saw, particularly among the agricultural laborers and the sweated tailors of Lon-

don, he threw himself into the Christian Socialist movement with the little company of clergymen and laymen that gathered around Frederick D. Maurice (*q.v.*) as leader. He declared himself in one passionate address, "a Church of England parson and a Chartist."

In *Politics for the People and the Christian Socialist* (see CHRISTIAN SOCIALISM), he wrote *Letters to the Chartist*, signed "Parson Lot." In his *Cheap Clothes and Nasty* he made a burning plea for the sweated tailors. Perhaps, however, he did his best work for social reform in his novels, *Yeast* (1848) and *Alton Locke* (1850). With Maurice, he advocated and sought to establish cooperative shops. In politics he was a Tory. He wrote: "I expect nothing from the advocates of *laissez-faire*, the pedants whose glory is in the shame of society, who arrogantly talk of economics as of a science, so completely perfected, so universal and all-important, that common humanity and morality, reason and religion must be pooh-poohed down." The Bible he considered the poor man's comforter and the rich man's warning. His program, however, was not radical. If he wrote: "My only quarrel with the Charter is that it does not go far enough in reform," he only meant, he explains further on, that the Chartists erred in "fancying that legislative reform is social reform, or that man's heart can be changed by act of Parliament."

"We must touch the workman at all his points of interest," he wrote to Mr. Ludlow, "first and foremost at association, but also at political rights, as grounded both on the Christian ideal of the Church and on the historic facts of the Anglo-Saxon race. Then national education, sanitary and dwelling-house reform, the free sale of land and corresponding reform of the land laws, moral improvement of the family relation, public places of recreation—on which point I am very earnest."

In later life, altho not giving up his views, he greatly modified his expressions, and is said to have regretted his earlier intensity. He devoted himself to ecclesiastical and parochial and sanitary reforms. "Politics and political economy," he said in 1857, "may go their way for me. If I can help to save the lives of a few thousand working people and their children, I may earn the blessing of God."

He wrote *Hypatia* (1853), *Westward Ho* (1855), besides numerous other stories, volumes of sermons, etc. In 1860 he was made Professor of History at Cambridge, resigning in 1869. He became Canon of Chester, and, in 1873, of Westminster. He paid a lecture visit to America. He died at Eversley, in 1875.

KNEIS, CARL G. A., was Professor of National Economics at Heidelberg, and one of the German socialists of the chair (*q.v.*). His *Die Politische Oekonomie vom Standpunkte der Geschichtlichen Methode* (1853, 2d ed., 1883) formulates and completes with great precision the canons of the historical school (*q.v.*) of Hildebrand and Roscher (*q.v.*). He challenges absolutism in economics, and teaches that political economy should vary in different times and countries. His *Geld und Kredit* (1873-79) has become a classic.

KNIGHTS OF LABOR, THE.—The order of the Knights of Labor was first organized as a local secret society in Philadelphia, December 23, 1869, by 10 garment cutters. They had previously been organized as a trade-union, but dissolved this union and organized the new society mainly under the lead of Uriah S. Stephens, one of their number. The names of the others were James L. Wright, Robert C. Macauley, Joseph S. Kennedy, William Cook, Robert W. Keen, James M. Hilsee, David Westcott, W. H. Phillips, Washington Shields. On December 30 the new society declared itself Local Assembly No. 1 of the Knights of Labor. Mr. Stephens was elected Master Workman. They decided to admit to their number working men, no matter of what occupation. They grew slowly; but a second assembly was not organized till 1872. During that year, however, 27 assemblies were organized in Philadelphia. The first assembly organized outside of Philadelphia was an assembly of gold-beaters in New York City. Christmas Day, 1873, the first district assembly was formed. A general assembly was not formed till January 1, 1878, at Reading, Pa., when Mr. Stephens was chosen Grand Master Workman. Up to this time the order had elicited little general notice; it was strictly secret, with ritual and educational work in the principles of the labor movement. The following declaration of principles was adopted at this assembly, having been written in substance by Mr. G. E. McNeill (*q. v.*) for a labor congress at Rochester in 1874. It came from this time the principles of the order.

The alarming development and aggressiveness of the power of money and corporations under the present industrial and political systems will inevitably lead to the hopeless degradation of the people. It is imperative, if we desire to enjoy the full blessings of life, that unjust accumulation and this power for evil of aggregated wealth shall be prevented. This much-desired object can be accomplished only by the united efforts of those who obey the divine injunction: "In the sweat of thy face shalt thou eat bread." Therefore we have formed the Order of the Knights of Labor for the purpose of organizing, educating, and directing the power of the industrial masses.

It is not a political party, it is more—for in it are crystallized sentiments and measures for the benefit of the whole people; but it should be borne in mind, when exercising the right of suffrage, that most of the objects herein set forth can only be obtained through legislation, and that it is the duty, regardless of party, of all to assist in nominating and supporting with their votes such candidates as will support these measures. No one shall, however, be compelled to vote with the majority.

Calling upon all who believe in securing "the greatest good to the greatest number" to join and assist us, we declare to the world that our aims are:

1. To make industrial and moral worth, not wealth, the true standard of individual and national greatness.

2. To secure to the workers the full enjoyment of the wealth they create; sufficient leisure in which to develop their intellectual, moral, and social faculties; all of the benefits, recreations, and pleasures of association; in a word, to enable them to share in the gains and honor of advancing civilization.

In order to secure these results, we demand at the hands of the law-making power of Municipality, State, and Nation:

3. The establishment of the Referendum in the making of all laws.

4. The establishment of Bureaus of Labor Statistics, that we may arrive at a correct knowledge of the educational, moral, and financial condition of the laboring masses and the establishment of free State Labor Bureaus.

5. The land, including all the natural sources of wealth, is the heritage of all the people, and should

not be subject to speculative traffic. Occupancy and use should be the only title to the possession of land. Taxes upon land should be levied upon its full value for use, exclusive of improvements, and should be sufficient to take for the community all unearned increment.

6. The abrogation of all laws that do not bear equally upon capitalists and laborers, and the removal of unjust technicalities, delays, and discriminations in the administration of justice.

7. The adoption of measures providing for the health and safety of those engaged in mining, manufacturing, and building industries, and for indemnification to those engaged therein for injuries received through lack of necessary safeguards.

8. The recognition, by incorporation, of orders and other associations organized by the workers to improve their condition and to protect their rights.

9. The enactment of laws to compel corporations to pay their employees weekly, in lawful money, for the labor of the preceding week, and giving mechanics and laborers a first lien upon the product of their labor to the extent of their full wages.

10. The abolition of the contract system on National, State, and Municipal works.

11. The enactment of laws providing for arbitration between employers and employed, and to enforce the decision of the arbitrators.

12. The prohibition, by law, of the employment of children under 15 years of age; the compulsory attendance at school for at least 10 months in the year of all children between the ages of 7 and 15 years; and the furnishing at the expense of the State of free textbooks.

13. That a graduated tax on incomes and inheritances be levied.

14. To prohibit the hiring out of convict labor.

15. The establishment of a national monetary system, in which a circulating medium in necessary quantity shall issue directly to the people, without the intervention of banks; that all the national issue shall be full legal tender in payment of all debts, public and private; and that the Government shall not guarantee or recognize any private banks or create any banking corporations.

16. That interest-bearing bonds, bills of credit or notes shall never be issued by the Government, but that, when need arises, the emergency shall be met by issue of legal-tender, non-interest-bearing money.

17. That the importation of foreign labor under contract be prohibited.

18. That in connection with the post-office the Government shall provide facilities for deposits of savings of the people in small sums.

19. That the Government shall obtain possession, under the right of eminent domain, of all telegraphs, telephones, and railroads; and that hereafter no charter or license be issued to any corporation for construction or operation of any means of transporting intelligence, passengers, or freight.

And while making the foregoing demands upon the State and National Governments, we will endeavor to associate our own labors:

20. To establish cooperative institutions, such as will tend to supersede the wage system, by the introduction of a cooperative industrial system.

21. To secure for both sexes equal rights.

22. To gain some of the benefits of labor-saving machinery by a gradual reduction of the hours of labor to eight per day.

23. To persuade employers to agree to arbitrate all differences which may arise between them and their employees, in order that the bonds of sympathy between them may be strengthened and that strikes may be rendered unnecessary.

At the third annual General Assembly, Mr. T. V. Powderly (*q. v.*) was elected Grand Master Workman, and annually reelected till 1893. The order now began rapid growth and excited general attention. There were at one time 700 local assemblies with some 500,000 members. Each year saw new growth. In the winter of 1885-86 there seemed to be a rush into organization. The railroad strikes in the Southwest (see STRIKES) and the excitement over the so-called Chicago anarchists (*q. v.*) turned the attention of working men everywhere to labor organization. At the General Assembly of 1886 delegates were present representing 800,000, and it was claimed

that the total membership was over 1,000,000. The growth was too fast. Men, without understanding the principles of the order, voted rash strikes. The general executive committee undertook too centralized an authority. Massing men of various callings into the same assembly, and failing sufficiently to respect the autonomy of the different trades, an opposition to this policy sprang up, eventuating ultimately in a split which culminated at the General Assembly of 1886, and resulted in the formation of the American Federation of Labor (*q.v.*), which does recognize the autonomy of each craft, and only federates the organizations of the various crafts into one general federation for general purposes. Since then the Knights of Labor have gone down and the Federation has grown. The order, however, was still for many years very powerful. In 1887 extensive headquarters were purchased in Philadelphia. A footing, too, was gained for the order in England and Belgium. Cooperative experiments were made, but proved unsuccessful. The order entered into political alliances with the Farmers' Alliance (*q.v.*), but little resulted from it save education.

In 1890 a journal was commenced called *The Journal of United Labor*, and later made a weekly and called the *Journal of the Knights of Labor*. The order continually losing ground, in 1893 dissensions led to the defeat of Mr. Powderly for reelection as General Master Workman, and Mr. J. R. Sovereign (*q.v.*) was elected in his place. Dissensions and desertions from the order have continued, till at present the order numbers only a very few thousand men. (See TRADE-UNIONS.)

KNIGHTS OF ST. CRISPIN.—The order of the Knights of St. Crispin was an organization in the shoe trade, first conceived by Newell Daniels, of Milford, Mass., in 1864. He moved West, and the first lodge of the order was organized in Milwaukee, Wis., in 1867. It gradually spread East, and by 1868 a grand lodge meeting was held in Rochester, representing 60 chapters. Martin Gavin was chosen the first presiding officer. The aim of the order was to unite all shoe-workers, to obtain the control of the trade. During the next few years the order grew very rapidly, claiming 400 lodges and 40,000 members at one time, making it among the largest trade-unions of the world. It established a journal, attempted cooperation, entered politics; it conducted strikes and won many, but the reaction came, and divisions sprang up and led to desertions, till in 1874 it had almost disappeared. In 1875 it was revived in Massachusetts and defeated an attempt of the Lynn manufacturers to make their employees promise to belong to no organization. The revival, however, was temporary, and by 1878 the order was practically extinct. It had aimed at too much, and failed save in educating its members for wiser efforts.

KNOW-NOTHINGS was the name applied to a secret political society in the United States, organized in 1853 to oppose foreign citizenship. The members were called Know-Nothings because if asked about the society they said that they knew nothing. Its real name is said to

have been the Sons of '76, or the Order of the Star-Spangled Banner. Its one principle was America for Americans. It played quite a part in the elections of 1854, and in 1856 held a convention, organized an "American Party," and nominated Millard Fillmore for President. After that it disappeared in the growing anti-slavery excitement. (See AMERICAN PARTY.)

KROPOTKINE, PETER ALEXEIVITCH, was born in Moscow in 1842 of a Russian noble family. He studied at St. Petersburg, and in 1862 joined a regiment of Cossacks as lieutenant, but resigned and traveled for five years in Eastern Siberia, collecting geological and geographical information. In 1867 he returned to St. Petersburg, studying science, and acting as Secretary to the Geographical Society. In 1872 he paid a visit to Belgium, and became interested in the International, along with Bakunin (*q.v.*). Returning to Russia, he joined the revolutionary circles, under the name of Borodin, and gave many secret lectures. Arrested in 1874 he was confined in the prison of St. Peter and St. Paul, but at the request of leading scientists he was allowed to continue his writings on the *Glacial Period*. His health failing, he was transferred to the Military Hospital, whence in 1876 he escaped to England. In 1877 he went to Switzerland, and in 1879 founded the paper *La Révolté* at Geneva (in 1885 transferred to Paris). Expelled at last from here, he was arrested, in 1883, in France, condemned to five years' imprisonment, but was liberated by the President of the French Republic. In 1886 he helped to found the English anarchist-communist paper *Freedom*. He has since resided at Harrow-on-the-Hill, near London. He takes high rank as a geographer and geologist, and is the leader of the anarchist movement in England. His title of Prince he repudiates. He has written many articles and tracts: *Paroles d'un Révolté* (1885); *Coming Anarchy* (1887); *Scientific Basis of Anarchy* (1887); *Appeal to the Young* (1890), etc.

KRUPP FOUNDRIES, SOCIAL WORK AT.—About the year 1861 the number of persons in the employ of the Krupp Steel Works at Essen had increased till the dwelling capacity of Essen was overtaxed. The firm began to think of methods to improve the situation. The first start in this direction was made in 1861-62. Two rows of houses, one with six dwellings and the other with four, were built for the foremen of the factory.

In the summer months of 1863 the first colony of workmen's dwellings, known as *Alt-Westend*, was built, and the houses rented to the employees. The buildings were simple, and, in the words of Mr. Alfred Krupp, intended for poor families who must save, but desire a healthful dwelling.

A second colony, called *Neu-Westend*, was completed in the winter of 1871-72.

In July, 1891, there were 3659 dwellings (not including 43 dwellings given to widows rent free). There has been a net income of 2.5 on the capital invested, and this has been spent on other local improvements.

In 1868 there existed in Essen a small co-

operative society, the majority of whose members were connected with the Krupp works. At the request of the officers of this society the firm undertook its management, and changed its character to that of a *Consum-Anstalt*, or a complete store on a large scale, whose object should be to furnish all varieties of first-class goods needed by the workmen at lowest possible prices. For many years the firm ran this *Consum-Anstalt* on its own account and at its own risk, grading prices so that the cost of administration would be covered without attempt at profit. In order, however, to do away with all possibility of doubt in this direction, a plan of real cooperation has been adopted in recent years. All sales are made solely on a cash basis.

At the end of each business year the total profits are divided among the purchasers in proportion to the value of purchases.

The boarding establishment is known as the "Menage." It was started as far back as 1856 with 200 unmarried men; through the sixties it had an average of 500 men, and by 1873 the number had reached 1775, but sank again to less than 500 persons in 1875. At present it averages about 800 men. The fall in numbers was largely due to the desire on the part of the men for greater freedom than the supervision of the "Menage" allowed. Other improvements have been made.

A board of physicians was formed whose sole duty is to look after the health of the employees and their families.

A large bathing establishment has been ar-

ranged, where steam baths can also be given when prescribed.

Insurance associations have been established—three in number—one for insurance against accident, one for life insurance, and one for insurance against sickness. The total sum paid by the Krupps for pension purposes is \$60,000 a year, of which \$2500 is paid under the provisions of the Imperial Insurance Law.

Two other funds, partially of a pension character, were established by Mr F. A. Krupp upon the death of his father in 1887, and are deserving of mention. One was a gift of \$250,000, the interest of which is to be administered and used by the directors of the other pension funds for the benefit of those who may need pensions, but through some technicalities may not be entitled to them through the regular channels, and secondly, for those whose regular pensions may not be sufficient to prevent want and suffering. The other was a gift of \$125,000 to the city of Essen, to be managed by a board of nine appointed by the mayor of the city, but to include four persons named by the owner of the Krupp Works. The interest of this fund is intended to be used for material and moral improvement, and at present is devoted to building working men's dwellings, that being considered the most pressing necessity. A building association also exists.

Scientific and manual training schools of all kinds have been introduced. Hours of labor have been reduced from 11½ to 10 hours. Such are the main social features.

L.

LABOR, as used in economic science, may be defined as work done by mind or body in producing wealth. (For a discussion of what production is, see PRODUCTION. For a discussion of what wealth is, see WEALTH.) The word is sometimes used to mean the class of manual laborers, as against capital, meaning thereby capitalists, because in the conflict between those who live by labor and those who live by investments, it is manual laborers that are usually considered. Nevertheless, even those who maintain, as did Adam Smith, and as most German socialists and American trade-unionists still do, that labor is the sole source of value, never claim that manual labor is the only kind of productive labor. Every one recognizes the need and value of the labor of management, the labor of the mind, in various ways. Manual labor is principally referred to in such phrases as "the labor movement," not because it is regarded as the only kind, but because it is that kind of labor which those who engage in the movement believe to have been most wronged in the past and most to need having wrongs righted in the present. All socialists, all trade-unionists, all working men recognize at least some kinds of mental labor as necessary factors in production. (For the kinds of labor that some consider unproductive, see PRODUCTION.) Some have limited the word labor to

painful labor. Jevons says (*Political Economy*, v.): "Labor, I should say, is any painful exertion of mind or body undergone partly or wholly with a view to future good." But this is undoubtedly misleading, if the word painful be understood in its ordinary sense, and partakes too much of views now generally condemned which largely put a despoise on manual labor. The labor of an artist, of an inventor, of a teacher, of a carpenter, of a farmer, need by no manner of means be always painful. Better is Ruskin's definition (*Unto this Last*, Essay IV.): "Labor is the contest of the life of man with an opposite; the term life including his intellect, soul, and physical power, contending with question, difficulty, trial, or material force."

Of the importance of the part played by labor in production there is no question and need be no statement. To the problems connected with labor this encyclopedia is devoted. (Concerning the reward of labor, see WAGES. Concerning the statistics of laborers, see OCCUPATIONS. Concerning the condition of laborers, see WAGES; WEALTH. Concerning the history of labor in the past, see SLAVERY; MIDDLE AGES; GUILDS. Concerning the history of the labor movement in modern times, see the different countries; and for the United States, TRADE-UNIONISM; SHORT-HOUR MOVEMENT; SOCIALISM; ANARCHISM, etc.

LABOR BUREAUS. (See LABOR EXCHANGES.)—Labor bureaus, in the modern sense, are a recent development. In the French Revolution of 1843 a department of labor was established (see ATELIERS NATIONAUX), and employment bureaus have existed from early times; but the first modern bureau of labor was the Massachusetts Bureau of Statistics of Labor, established June 23, 1869, as the result of a strong agitation conducted by the Boston Eight-Hour League (see SHORT-HOUR MOVEMENT), mainly led by Mr. George E. McNeill (*q.v.*), with the aid of Wendell Phillips and others. The first chief of the bureau was General H. K. Oliver, and with Mr. George E. McNeill as deputy. Pennsylvania was the next State to follow, establishing a bureau in 1872, other States falling into line later, till at the beginning of November, 1892, there were in the United States, including the Federal Government, 28 offices popularly known as bureaus or departments of labor. These offices have various titles, but their duties are similar, and consist almost solely in gathering statistics of various kinds that bear in one way upon the condition or the interests of labor. The work they do is of varying value, according to the character of the men in charge, and according to the amount of money placed by the State at their disposal for the collecting of statistics. The statistics collected by some of them will scarcely bear any scientific analysis, while those of even the best of them—a place often accorded to the Massachusetts Bureau—are often open to sharp criticism. (For an illustration of this, as to the Massachusetts Bureau, see PROFITS, NET.) Nevertheless, the good they have done in collecting information can scarcely be exaggerated, and most of them will compare favorably with similar bureaus in any other country.

The National Bureau of Labor at Washington, D. C., was created as an office in the Department of the Interior by act of Congress, approved June 27, 1884, and organized January 22, 1885, by the appointment of Carroll D. Wright, of Massachusetts, as commissioner. The functions of this bureau ceased June 13, 1888, at which date the act of Congress creating its successor, the Department of Labor, was approved. This act was the result of a demand on the part of the Knights of Labor and other labor organizations. The Department of Labor is independent of the Department of the Interior and of all other departments, and hence deals directly with Congress and the President. The term of office of the commissioner is four years; at the expiration of this period a reappointment or a new appointment is made. The term of other employees is not so limited. The regular appropriations made by Congress have risen from \$25,000 in 1884-85 to over \$175,000 in 1891-92. Congress occasionally directs special investigations to be made, and appropriates money for the purpose, as in the case of an inquiry into the statistics of marriage and divorce and into the industrial and technical school systems. It also provides by special acts for the printing and binding of the annual reports. These are usually sent free of cost to all persons in the United States who apply for them if the

supply admits. They are also sent in exchange to all Government officials or other persons in foreign countries who have rendered the department a service by forwarding to it their own publications. If the supply is not exhausted, they are sent to other distinguished foreigners who express a wish for them. The reports hitherto issued deal with industrial depressions, convict labor, strikes and lockouts, working women in large cities, railroad labor, the cost of production in the case of iron, steel, coal, with industrial education, building and loan associations, strikes, lockouts, compulsory insurance, marriage and divorce, the Gothenburg system of liquor traffic, slums, the housing of the working people, labor law, etc. The object of the department, as expressed in the act which constituted it, is the "acquiring and diffusing among the people of the United States useful information on subjects connected with labor in the most general and comprehensive sense of the word, and especially upon its relation to capital, the hours of labor, the earnings of laboring men and women, and the means of promoting their material, social, intellectual, and moral prosperity."

November, 1895, the department commenced issuing a *Bulletin* of about 100 pages every other month.

In Germany, a commission for labor statistics was appointed in 1892, and consists of 13 members. The chief and one other member are appointed by the Chancellor; the Reichstag appoints six members, and the Bundesrath, five. It meets, however, only when called by the Chancellor—an arrangement which, with its constitution, gives great dissatisfaction to German working men.

England has a Board of Trade with a labor department which, in 1893, commenced publishing a labor gazette.

In France there is an Office du Travail, or Labor Bureau, established by a decree of August 19, 1891. Its purpose is the collection of statistics, and the prosecution of any investigation that may be assigned to it. It is a distinct department, under the authority of the Minister of Commerce, Industry, and Colonies, having a director with a salary of \$3000, and 17 assistants. The Director is appointed by the President on the nomination of the Minister. (See LABOR EXCHANGES.)

In Switzerland, the work of a labor bureau is performed by a Secretary of Laborers, and working in connection with the Confederation of Laborers, and yet a member of the Central Government. (See SWITZERLAND.) The office was created in 1887.

A Bureau of Industries was established by the New Zealand Government in June, 1891, under the direction of the Hon. W. R. Reeves, Minister of Education and Justice. The objects desired by the Government were the compilation of statistics concerning the condition of labor generally; the establishment of agencies for reporting the scarcity or overplus of workers in particular districts; the transfer of such workers from overcrowded localities to places needing labor; and, generally, the control of all industries for the physical and moral benefit of those engaged therein. (For the activities of

the Bureau in aiding the employment of the unemployed, see UNEMPLOYMENT.)

References: For the statistical publications of the various countries on the subject of labor, see Appendix.

LABOR CHECKS.—Many socialists, tho not all, believe that under a socialistic *régime* so-called *labor checks* will be used in place of money. Every one, according to this idea, will work for the common good, and will be paid checks stating that he has labored so many hours, these checks to be good for purchases at the various stores of the commonwealth. Says Lawrence Gronlund, in describing their use (*The Cooperative Commonwealth*, revised ed., chap. vi.):

"As the products were received, or as services were rendered, labor checks will have been issued (or perhaps such money as we use now, which then, however, will have no other function than the checks—that of being tickets, tokens), each check will represent so many normal days of common labor, and there will, during each fiscal year, have been exactly as many checks issued as will correspond to the days of labor, productive or unproductive, actually performed.

"The outgoings will be distributed at the various depots or bazaars of the commonwealth to the holders of these checks; 'sold' there, in other words. These check-holders may be those to whom they were originally issued, or strangers visiting the country, or citizens who have parted with something valuable for them. These bazaars will be one-price establishments. The wares will have their value—real, 'natural' value, as Ricardo termed it, which is, as we saw in Chapter I, the amount of human labor embodied in them; that determines their value now, has always done it, and will determine it under the new order. The wares will be sold for a price equal to that value, with possibly a percentage added.

"For it will be noted that the checks issued represent and call for more days' labor than are contained in the products destined for distribution. There are, first, the checks issued to those citizens who have performed unproductive labor—physicians, judges, teachers, clerks, domestic helpers, etc.; and next, checks for the labor contained in what is set aside as capital. There are thus a good many legitimate claims which must be extraordinarily provided for."

By no means, however, do all socialists agree with this idea. Most English Fabian socialists reject and laugh at the whole idea. A still larger number neither reject nor accept the idea, believing that socialism, as distinctly evolutionary, will work its way step by step, and leave such details as labor checks to be devolved when the time comes, if it then seem wise. (See SOCIALISM.)

LABOR CHURCH, THE.—The Labor Church originated in the conviction in the mind of the writer of this article that the labor movement, far from being the mischievous and godless thing it was commonly supposed to be, was really the most advanced point at which the Divine energy was operating in the higher evolution of man. Behind this conviction lay another, which preceded it and made it possible—namely, that God was not to be found in the traditions of the historic churches, but in the individual soul and in the progressive development of life in our own time. And the relation of the historic churches to the Labor Church, as I understand it, is this: that the former indicates where God has been in past ages, while the latter attempts to indicate where God is to be found to-day; and that, therefore, the former seeks to bring the labor movement round to their relig-

ion (so far as they have any real interest in it), while the latter attempts to develop into self-consciousness the religion already present in the labor movement itself. The historic churches say, when sympathetic, "Add Christianity to your labor movement;" the Labor Church says: "Go on with your work in the labor movement, and find God's service and God's presence where you are."

The first Labor Church service was held in the Charlton Town Hall, Manchester, on Sunday, October 4, 1891. My idea was to speak myself every alternate Sunday, and on other Sundays to invite the most prominent socialists or labor leaders to give the address. On the first Sunday, therefore, I spoke

Origin.

on *The Program of the Labor Church*; on the second Sunday, Robert Blatchford, editor of *The Clarion*, gave an address on *Sunshine and Shadow*; on the third Sunday I spoke on *God in the Labor Movement*; on the fourth Sunday, Ben Tillett took for his subject *The Ethics of Government*. The service consisted of hymns, solos, reading, and prayer, as at any popular service, but with this difference—that the hymns were distinctly socialistic as well as religious. Readings have been taken from Lowell, Whittier, Gerald Massey, Ruskin, Carlyle, Whitman, William Morris, and other modern writers; and the prayers were short and unconventional, and entirely free from the traditional phraseology.

On the second Sunday, such large numbers were unable to gain admission to hear Robert Blatchford that we had to leave the Charlton Town Hall and take the People's Concert Hall, an old music hall with seats for 1600 people. From the first the movement has been a marked success; indeed, the real danger to it consists of the fact that it has spread almost too rapidly. Before starting, I imagined myself preaching for years to a few people who would gradually come to understand my message and then spread it among their fellows. After three years the problem is how to deepen the religious sense in the midst of a movement which in so short a time has covered so wide an area.

By the end of the first month many of the people who came to our Sunday services wanted to organize themselves into a Labor Church. A week-night meeting was therefore called for the purpose of organizing a church, and the following principles were presented and accepted as our basis after they had been discussed freely:

Organization.

1. That the labor movement is a religious movement.
2. That the religion of the labor movement is not a class religion, but unites members of all classes in working for the abolition of commercial slavery.
3. That the religion of the labor movement is not sectarian or dogmatic, but free religion, leaving each man free to develop his own relations with the power that brought him into being.
4. That the emancipation of labor can only be realized so far as men learn both the economic and moral laws of God, and heartily endeavor to obey them.
5. That the development of personal character and the improvement of social conditions are both essential to man's emancipation from moral and social bondage.

In January, 1892, the *Labor Prophet* was started as the organ of the movement, being

published monthly at a penny. A Labor Church hymn-book followed, and more recently a tune-book has been issued. Labor Church tracts have also been published for propagandist purposes, and many thousands of handbills explaining our aims and principles.

In July, 1892, a Labor Church was opened in Bradford. The immediate cause of the formation of a Labor Church in that town was the public opposition of the Nonconformist ministers to the parliamentary candidate of the Labor Party, Mr. Ben Tillett, the celebrated dockers' secretary. In the interests of disestablishment they supported an employer of labor who had made himself especially obnoxious to the working classes, and who, singularly enough, has since severed himself from the Liberal Party because of its having partly adopted an eight-hour policy.

During the winter of 1892-93 several more churches were formed, in each case the demand being entirely local and spontaneous. No attempt has been made to organize the spread of the movement from headquarters. It has been left entirely to its own natural development.

In July, 1893, a conference of Labor Church delegates was called for the purpose of forming a Labor Church Union. This step was rendered necessary through the breakdown of my health, and the development of difficulties which could only be satisfactorily dealt with by a properly constituted authority. At this conference 10 churches were represented. A constitution was formulated, to be confirmed by a succeeding conference; and a council was appointed to carry on the work of the Union. Mr. Fred Brocklehurst, B.A., was appointed general secretary, having already acted for some time practically in the same capacity.

At the time of writing (November 1, 1894) there are nominally some 24 labor churches in existence, reaching from Dundee, in Scotland, to Plymouth, on the south coast; and we hear of several places in which Labor Church services are about to be commenced. Only in a dozen towns is the Labor Church fully organized, with an enrolled membership and properly appointed officers. In other cases the Labor Church is little more than the Sunday meeting of the local branch of the Labor Party, conducted on Labor Church lines, often with the prayer omitted. This is chiefly the case in the smaller towns, where there are neither the men nor the means at present to run two organizations successfully.

The real need of the movement now is a body of eloquent speakers to deliver the distinctly religious message conveyed in our principles, and to evolve what is there formally presented into the energy and inspiration of a new religious faith. At present the speakers of the Labor Church are almost exclusively the speakers of the Labor Party over again, and they usually confine themselves to politics and socialism.

The difficulty of the Labor Church is the difficulty that lies in the way of all progress—that men and movements can seldom work out two ideas at the same time. And yet to secure real progress this is what is always demanded.

On the one hand, the historic churches have

been preaching that the salvation of the individual is the road to the salvation of society; on the other hand, the socialists have been preaching that the reform of society is the road to the reform of the individual. The Labor Church was founded to run these two conceptions side by side, as each equally important.

Carrying this idea further, the Labor Church was founded to stand both for social reform and for religious reform, and to make of social reform the practical work of the religious life. But social reform is so absorbing a matter in England to-day that those upon whom it seizes seldom seem to think of any other reform being needed; while many abandon all sense of the need of any religion at all. This is far nobler than the otherworldliness from which it is a reaction; but still it is a reaction, and has in it all the needless limitations of a reaction, and does not bind together the two strands of the outward and the inward life.

And carrying this idea further still, the Labor Church was founded to stand both for the kingdom of God in the world and the kingdom of God in the heart—to emphasize the Divine operation in the continual development of life, and man's call to cooperate with God in this work; and equally to emphasize the Divine operation in the individual soul, and to establish a living temple of God in the human heart.

It is needless to say that the labor churches do not to-day signify all this; and it would be foolish to complain because they do not. We are transplanting religion to a richer and more fruitful soil; but it withers somewhat in the process; and if the labor churches say little about the service of God, I am

sure they are heartily engaged in it. Considering how long religion has been enslaved by tradition, how terribly the religious persecutions and conflicts have burned into sensitive consciences, how the natural religious instincts of the human heart have been for centuries distrusted and the natural virtues of human nature persistently discredited, it is rather a wonder that socialists, and especially working men socialists, should respond to any plea in the name of religion at all, or be willing to associate themselves together in any organization calling itself a church.

As a matter of fact, I know that all through the labor movement there is a vast demand for a new religious message such as the Labor Church was intended to deliver. Human hearts everywhere are waiting for the appearance of men and women of the new knowledge and the new ideals, but also of the old prophetic type—men who have lived resolutely, and in their living have somewhere met with God. Such men are of the very rarest, and yet such are the men for which the labor churches everywhere wait.

Meanwhile, the labor churches are quite justifying their existence. At the very lowest estimate they are the labor movement at its best; and I know that throughout them there lives an earnest though mostly dumb desire to reach to something higher. This shows itself in practical ways. An effort, for instance, is being made to

Aims.

Results.

**Labor
Church
Union.**

establish Sunday-schools in connection with the churches, and already in several of them the poorest children in their neighborhood have been systematically en-

Work. entertained and fed in the winter and taken into the country in the summer. Adult classes are held, and social gatherings are successfully organized through the winter months. The hearty singing at the services of our Labor Church hymns is also an element of help and strength. Moreover, the churches, tho poor enough, are all self-supporting, and ready for any amount of energetic work. If their religion is somewhat dumb, it does a deal of work, and I am sure that God underlies.

In conclusion, the Labor Church must not be confounded with the attempts which are everywhere being made to induce the working classes to come to church. It means the setting up of a church right in the heart of the greatest movement in modern times. Neither must it be regarded as the church of a class. It is the church of all those, whatever their class, who desire to serve God through the advance of the labor movement; and to serve Him, not in the bondage of the old tradition, but in the spirit of the new life.

This article would be incomplete without a reference to the Labor Church in America.

In the early part of this year (1894) Herbert N. Casson commenced Labor Church services in Lynn, Mass. Mr. Casson is working out the original conception in his own way, and brings a large store of energy, ability, and insight to the great task he has undertaken. He has recently been joined by his brother, Charles W. Casson, who is working with a Labor Church which was started in Providence, R. I. Both have come from the Methodist ministry, and bring to their new undertaking all the religious enthusiasm of that great section of the Christian Church. They are of those who know how to cast off the traditional form of religion without losing hold on the realities of religious service and life.

The difficulties of the work will be very different in America from what they are here, and in some respects much more serious. Here the socialist movement is very much of the nature of a fair-weather demonstration, tho it can hardly be supposed that this will be allowed to last. On half holidays and Sundays young men ride out on their bicycles, and find in making converts to their doctrines most easy and delightful sport. In America the work will be far sterner than this, as it probably will be with us before long.

JOHN TREVOR.

LABOR COLONIES for the provision of work for the unemployed have assumed considerable dimensions in Germany, Holland, Belgium, and France. They have been established with the view of organizing the labor of the able-bodied unemployed, either temporarily, as in Germany, or permanently, as in Holland.

HOLLAND.

The Dutch colonies are the oldest. They have not been elaborated out of speculation,

but forged into their present organic form under the fire of criticism.

General van den Bosch, very soon after the devastating war which was terminated by the battle of Waterloo, saw in Holland thousands of families reduced to helplessness and poverty.

Through his influence there was organized, in 1818, the Society of Beneficence (*Maatschappij van Veldadigheid*), and the society purchased a large tract of barren, uncultivated heath, which, with additions, now contains 5100 acres. It is situated near the center of the kingdom, northeast of the Zuyder Zee, about five miles from the town of Steenwyk.

With the motto, "Help the people and improve the land," enthusiasm was aroused, and in a short time there was enrolled a membership paying annually into the treasury of the society \$22,000. The organization was in such a prosperous condition, and it was able to do so much for its beneficiaries, that it attracted the attention of the State. The proposition was soon made that the society take charge of the wards of the Government—that is, the beggars, foundlings, and orphans. The conditions offered were so favorable that the society accepted them.

It seemed unwise to put those declared incapable of self-support by the side of others able to become independent. Consequently the organization secured land and established two separate beggar colonies. These were considered by some to encourage begging, and were confused with the other colony, till all three fell into disrepute, and the society found itself in debt.

A complete reorganization followed. The "beggar" colonies became government property, and a complete disunion of the beggar and the free colonies took place.

The organization as at present constituted dates from September 15, 1859.

The underlying principle of the free colony in the revised scheme seems plainly to be to assist the destitute in meeting his wants, and the wants of all who depend upon him, without suggesting a feeling of dependence and without disturbing the family relations. The colony is conducted on the following plan:

When a new family arrives a house is provided and the immediate wants of the household attended to—not in the shape of gifts, but advances, which must be paid for in instalments according to conditions previously made known to the newcomer. He is also supplied with a sheep (ewe), which can be pastured on the society's farm for a small sum. On this he makes weekly payments. The purchaser is advised to insure this animal in the general funds of the society, so that in case of death it can be replaced without loss to the owner. At the very beginning a man is invested with the feeling of ownership, and a way is provided by which, with due economy, he may meet his obligations.

All the wage-earning members of this newly arrived family are at once put to work on one of the society's farms or in some of the shops or factories operated by it. Idleness is not tolerated. The children must either be learning a trade or be at school.

Wages, such as are current in the vicinity of the colony, are paid weekly, after having deducted the instalment on the debt incurred upon arrival; house rent, not exceeding 20 cents; 1 cent infirmity fee for each person; 4 cents for the clothing fund; and a reserve for the family emergency fund, equivalent to 10 per cent. of the gross earnings.

After two years of probation, if the head of the family has given evidence of industrious habits and a commendable desire to pay his debts, he is promoted

to citizenship, and is called a "vrijboer," or "free farmer." If there is a place available he is put on it—a farm of 7.7 acres—apparently a small one, but it is so fertile that it will readily support an ordinary family. Rents vary with the condition of the house and the fertility of the land, but the average annual rent is \$20. The payment on his indebtedness is only \$4 a year. In addition to this, he must each year put on the land \$14 worth of manure, but this item is remitted in case he owns a cow and is duly saving of all manure.

A man ordinarily cannot remain in the colony as a laborer more than two years. If he fails in this time to give evidence of the possession of those qualities demanded of a farmer he must leave. But once admitted to the farmer class he may remain so during good behavior.

One of the Government agricultural experiment stations is located in the colony.

In addition, schools of agriculture, of horticulture, and of forestry have been erected. The society is absolutely free from religious bias. It has within the colony a Protestant and a Catholic church, and provides for the maintenance of both.

In July, 1895, there were 1826 people in the colony. They were grouped as follows: Farmers, 199 families; laborers on probation, 85 families; individual laborers, not belonging to the foregoing, 165 persons.

The last balance sheet (1893) shows that the receipts and expenses were as follows:

RECEIPTS.	
From members	\$5,418.40
From special gifts ..	3,931.20
From rent of land and farm products.....	3,128.52
From forest	615.02
Profit on laborers' and apprentices' work....	733.44
Total	\$13,826.58
EXPENSES.	
Deficit for the preceding year	\$745.94
Interest on debt.....	1,381.91
General expenses of administration.....	4,790.32
Religious services and special instruction....	1,097.32
Ditching, road-making, unproductive work, and losses in the various factories.....	8,092.00
Advances to colonists over and above returns	538.29
Total.....	\$16,645.78

That is a deficit for the year of \$2819.20, or \$1.54 for each inhabitant, but the estimated value of the property is \$533,274, and the indebtedness, \$43,380.

The "beggar" colonies are conducted on a somewhat different system, with little permanency of inmates.

There are about 2700 persons in three districts. They are employed in forestry, agriculture, and gardening, and have an allowance for wages besides support.

BELGIUM.

The Belgian labor colonies were originally founded in 1810. When the independent kingdom of Belgium was constituted there existed six provincial *Depôts de mendicité*, besides two colonies which had been established by the *Société de Bienfaisance*.

The colonies were suppressed in 1841 on the expiry of the contract between the Government of the Netherlands and the *Société de Bienfaisance*, in 1823, and of the *depôts* three were suppressed, two were changed into homes for poor boys and for girls and women; one was left unchanged.

In 1870, and further in 1881, the Belgian Government acquired the former Dutch *Colonies de Bienfaisance* of Merxplas and Wortel and reunited them under the denomination of the *Colonies agricoles de Bienfaisance*.

At present these colonies occupy about 2964 acres.

The colony of Merxplas is by far the largest and most important colony of the kind. It is exclusively intended as a penal colony for beggars and vagrants. The men work in gangs in the fields under the supervision of an officer, who is accompanied by a soldier with loaded musket. The following is a list of the employments of 2853 colonists:

Agricultural laborers.....	2,000
Farmyard workers.....	137
Gardeners	61
Masons, bricklayers, etc.....	189
Forgemen.....	121
Carpenters.....	139
Tailors.....	88
Painters.....	24
Rope-makers.....	17
Bakers.....	21
Gas-workers.....	6
Other industries.....	38
Kitchen.....	12

In addition to this large body of men who work for the colony under the superintendence of the officials, about 700 colonists are employed by a private company under contract with the Government. These men work under precisely the same conditions as the others.

The wages paid by this contracting company are 12, 18, and 21 centimes per day. Wages are at present paid almost wholly by time, but piece-work is being introduced.

At Wortel there are some 1800 persons, including 38 voluntary colonists, who are engaged in forestry and agriculture under less stringent conditions than those under which the forced labor of Merxplas is carried on.

It is very questionable whether or not such an institution can be regarded as reformatory in any real sense. The Belgian institution seems to be simply punitive.

GERMANY.

The first German labor colony was that of Wilhelmsdorf, near Bielefeld, in Westphalia. This colony was founded by the enthusiasm of Pastor von Bodelschwing, who has during the past 15 or 16 years made Bielefeld famous as a place for the treatment of epileptic and anemic patients, and also as the scene of a considerable experiment in the provision of workmen's houses. The Wilhelmsdorf colony was established in March, 1882, and in the succeeding year was followed by Kästorf, Rickling, Friedrichswille, Dornahof, and Seyda. In 1884 five colonies were founded; in 1885, two; in 1886, four; in 1888, four; in 1889, one; in 1891, two, and in 1892, two. The total number of colonies in 1893 was 26, three of these being Roman Catholic and the remainder Protestant.

The system is under the control of the German Labor Colony Central Board (*Centralvorstand deutscher Arbeiter-Kolonien*), founded in October, 1883. The policy of the board is thus described:

1. The colonies are institutions of Christian charity, in which any one who has suffered inward or outward shipwreck, or who stands in danger of so suffering, may be received and raised again. Colonists have no legal claim to the benefits of the institution.
2. All able-bodied men who are willing to work are admitted without distinction of character or religion so long as there is room.

3. Dipsomaniacs are not admitted, or, if admitted, may be expelled.
4. The special aim of the colonies is to secure the permanent moral elevation of the colonists.
5. The house regulations of the colonies are the same throughout.
6. Board and lodging must not be in excess of the strictest requirements.
7. The scale of pay (board, lodging, and payment in cash or clothes, etc.) must be lower than the daily wage prevailing in the locality.
8. Dismissal is the only form of punishment.
9. Colonists dismissed for ill-behavior shall not be admitted into another colony without the consent of the colony which discharged them.

The funds for the support of the colonies are obtained (a) from grants by the provincial governments; (b) from grants by the municipalities; (c) from donations and subscriptions by members of the provincial societies; (d) from collections in the churches; (e) from house-to-house collections.

The system is made up of several separate organizations working hand in hand. There are the *Verpflegungs-Stationen*, or relief stations; the *Herbergen zur Heimat*, or workmen's lodging-houses; *Arbeiter Kolonien*, or labor colonies; and the *Arbeitsnachweis-Anstalten*, or labor bureaus. There are, besides, the branch colonies, and a further development of labor colonies for permanent residence, and still further a system of training the superintendents.

The total number of persons who have entered the colonies from the foundation of the first until June 30, 1893, was 63,394, and the total number discharged was 61,334. The number of places in the colonies at that time was 3044.

From the foundation of the first colony until March, 1891, there were 44,807 intrants; 57.7 per cent. of the colonists were in the prime of life—viz., of 25 and under 45 years of age; while 16.1 per cent. were under 25 years of age, and not more than 3.2 per cent. fairly entitled to be regarded as aged.

A general regulation exists among the colonies to the effect that prolonged residence should be discouraged, and in no case should a colonist be allowed to remain longer than two years. The object of this regulation is to prevent the colonist from acquiring under the German law of settlement a domicile in the colony, which would render the commune in which the colony is situated liable for his maintenance as a pauper, should he ultimately come upon the poor roll. Altho this regulation is necessarily observed in the letter, some of the colonists are nevertheless practically permanent residents.

Of 2623 who obtained situations, 814 returned to the colonies; and of 8564 who left at their own desire, 3117 came back within two years of their discharge.

This shows that the colonies have largely become the resort of the homeless, 62 per cent. of those admitted being so described. Since, however, 76 per cent. of the colonists have been in prison, there can be little doubt that the immediate cause of resort to the colonies of three fourths of those who go there is inability to obtain employment owing to their having been in prison.

In 1880, before the colonies were founded, the number of individuals prosecuted for vagabondage in Germany was 23,093. In 1890, when the

colonies had been in existence for eight years, this number had fallen to 13,583. This may be regarded as suggesting that the colonies and the subsidiary institutions connected with them are dealing effectively with the problem of vagrancy and begging, but it would be unsafe to attribute the diminution wholly to the influence of the colonies.

Taking the figures for the 22 colonies in 1889-91, it is found that 53.7 per cent. of the total number had been in the colonies only once, and 46.3 per cent. more than once.

The repeated admissions into the German colonies as disclosed by the statistics, together with such knowledge as one can obtain of the types of men that make up the ranks of the 8000 who pass through colonies annually, show that the colonies are dealing with a body of at least 4000 men, who are for various

Nature.

reasons unable to regulate their own lives on an independent basis, or who are unable to get or to keep employment under customary conditions. Altho the colonists are set free to go from or to stay in the colonies, when they elect to stay they must conform to the discipline imposed upon them. There thus appears to be a certain class, amounting to one half of the cases dealt with, who are willing, or who feel themselves forced, to exchange the freedom of ordinary industry without guarantee of subsistence, for the practical, tho mild, slavery of the colonies with guaranty of subsistence.

The percentage of "discharges to situations," never great since the development of the colony system really began, has been steadily decreasing.

The question of the influence of the operations of the labor colonies on the rate of wages is one to which a positive answer is difficult to give.

Two kinds of influence might be alleged: (1) That they reduce the rate of wages by the competition of their products in the outside market, and by the low minimum wage fixed in the colonies; or (2) that they raise it by drawing off from the labor market a number of workers whose standard of subsistence is extremely low.

Those best qualified to judge of the economic effects of the German colonies are unanimously of opinion that they have had no influence upon the rates of wages.

It is to be observed, however, that the colonies do not interfere with the labor market, because they do not deal with the problem of the want of employment of the respectable workman. It is because the colonist is non-efficient that he does not compete in the labor market.

In nearly all of the agricultural colonies in Germany the labor of the colonists is devoted to the reclamation of land.

For the first 14 days after his arrival the colonist receives his maintenance, but is credited with no wages in addition. Should he be in need of clothes, as he generally is, he is supplied with these on credit. After the first fortnight the colonist is credited with wages at the rate of from 20 pf. to 30 pf. (2½d. to 3½d.) per day in addition to his board and lodging.

The rate of wages is not uniform. Two of the cattlemen who have been for a considerable

time in the colony have 50 pf. (6*d.*) per day ; two others have 40 pf. each, a few have 30 pf. per day ; the bulk have 25 pf., a few old colonists have 20 pf., and a very few 10 pf. (about 1½*d.*) per day. The rate is wholly at the discretion of the director of the colony. The bulk of the colonists have 25 pf. per day ; but this applies only to the nine months during which it is possible to work out of doors for a full day.

The amount due to the colonist as wages is not paid in cash until he leaves the colony, and then he receives an order upon the Bielefeld institution for the money. But in many cases the colonist leaves the colony in debt. The cost of his clothes and his tobacco has more than swallowed up his surplus earnings.

Of the 104 persons who entered Wilhelmsdorf during the three months ending March 31, 1893, 91 had left the colony on August 6.

	Marks.	Pfen- nig.
Of these 91, 35 left in debt, the aggregate amount being.....	223	12
(An average of 6 marks 37 pfennig per head).....		
Of these 35, eight repaid their debts, amounting to.....	49	10

On account of these results it was proposed that those who have been imprisoned twice or more be placed in improvement colonies and compelled to remain at least three months, while those willing to improve, but needing permanent organization for their labor, should be sent to home colonies on the Dutch model. (See above.) A home colony was opened at Friedrichwilhelmsdorf in 1886, and has an average of about 35 colonists ; 12 families have cottages.

FRANCE.

The city of Paris established a labor agricultural colony at La Chalmelle in 1892, leased by the city to *l'Assistance Publique*, the branch of municipal administration having charge of executive details of this kind, the city paying to *l'Assistance Publique* interest at the rate of 3 per cent. per annum upon the capital employed. The area of the farm is 316 acres.

The total cost of the colony for the year 1892-93 was 32,000 frs., the receipts from the sale of produce were 17,000 frs., and the net cost of the colony for the year was 15,000 frs.

Wages are paid at the rate of 50 c. per day.

Clothes are supplied free on entrance, but subsequent requirements are debited to the colonists.

Admission into the colony is reserved for those who are recommended by the directors of the night refuges in Paris. In this respect the system resembles that adopted by the Salvation Army in London.

The type of men in this colony is on the whole superior to that of the German colonies. Here there are no ex-convicts. The causes of resort to the colony, unless the authorities take too lenient a view, are quite different from those which send the German colonist to his colonies. "Family misfortune," "disgust with the life of

Paris," and similar causes are given. The men are, however, picked, and both in Paris and in the colony are the objects of individual care. Theoretically, at all events, much attention is paid to individual needs and peculiarities.

ENGLAND.

In England, the experiment of the Home Colonization Society, in Westmoreland, is the most direct attempt to establish in England a labor colony by voluntary effort on similar lines to those adopted in Holland.

The object of the society is to provide work in English "industrial villages" for the able-bodied poor.

The proposal was to plant a body of able-bodied unemployed men and women in some rural district and hand over to them some 300 or 400 acres to enable them to supply their own wants by their own work. They were to make one another's bread, weave one another's clothes, consume one another's produce, and thus avoid buying in an outside market. A home, food, education, and medicine were to be offered in return for obedient service. Part of the land was to be put aside and its produce sold in the ordinary markets to defray the expenses of management. The sales of surplus produce and purchases in the open market were to be confined to articles now imported into England from abroad.

With these aims in view four acres of land were purchased in April, 1892, another acre in the following July, and 126 acres in November. Operations were begun with two colonists, and there have been as many as 30. The average number has been 15 persons who are stated to have been maintained at a total cost, from the commencement to May 15, 1893, of £385 9*s.* 6*d.*, or about 10*s.* per week each, exclusive of cases where shelter and food have been given to tramps for work done. The labor of the colonists has been supplemented by the services of one or two skilled agriculturists.

The society aims at the permanent settlement of the colonists on the land and not at drafting them off to ordinary farms, but it must necessarily take time for the casual colonist to be replaced by those caring to stay permanently. Up to September, 1893, 52 persons passed through the colony, of whom 22 are now resident.

The progress of the colony has been seriously impeded by internal dissensions turning chiefly on the mode of government of the village. Some of the first colonists appear not to have belonged to the ordinary unemployed class, but to have been attracted to the colony by the expectation of taking part in a communal experiment. As a consequence of these difficulties and misunderstandings, 14 members were expelled from the colony. (For an account of the farm colonies of the Salvation Army, see SALVATION ARMY. For various cooperative agricultural experiments, see COOPERATION.)

OTHER COUNTRIES.

Switzerland possesses one institution, the Tannenhof Arbeiterheim, with aims similar to those of the German labor colonies. This es-

tablishment or "workman's home," founded April 1, 1889, covers about 107 acres, and is carried on by a society registered as a limited liability company, the by-laws of which describe its aims as follows:

"By farming an estate to provide a temporary home for those in search of work, as well as for unemployed persons discharged from the prisons of Berne; board, lodging, and wages being provided in return for agricultural labor until permanent work be secured elsewhere."

New Zealand has commenced experiments on this line, the Government undertaking to provide government farms of about 1000 acres fit for agriculture, and on them to organize cooperative communities. The system, however, has been too recently organized to show results. (See NEW ZEALAND.) In the United States, no labor colonies of this sort exist. Those that come nearest to it are the experiments of the so-called Detroit Plan (*q.v.*). (See COOPERATIVE COLONIES. For a discussion of labor colonies and for references, see UNEMPLOYMENT.)

LABOR DAY is a holiday in the United States for working men on the first Monday of September, usually celebrated by parades of labor organizations, addresses, picnics, etc. It was first held in a few States in 1887, and is now a legal holiday in about half the States. In Europe, May 1 is usually celebrated as a labor festival, and has been taken advantage of by socialists for gigantic demonstrations. In some countries disturbances on this day have caused the governments to forbid its celebration.

LABOR EXCHANGE, THE. (See LABOR EXCHANGES.)—In March, 1890, there was organized a labor exchange, with headquarters at Independence, Mo. It is planned on a system invented by G. B. DeBernardi, and described in his book, *Trials and Triumphs of Labor*.

The Exchange has an organ devoted to its interests, published at Olathe, Kan., and known as *Progressive Thought and Dawn of Equity*. It is edited by E. Z. Ernst, who is also general organizer of the Exchange. In the beginning of 1896 about 80 local branches were claimed, mainly in the South and West.

The essential features of the scheme are these: A local exchange having been established by 15 or more members, who pay \$1 each for a life membership and \$2.50 for a branch charter, a warehouse is secured and placed in charge of one of the members. Unused products of the labor of the members are then deposited in the warehouse and certificates issued in exchange at the wholesale value of the goods deposited. These certificates circulate among the members of the local exchange, and are presented at the warehouse in exchange for any needed goods found therein. All goods that are sold are sold at the regular retail market price. The profit between wholesale and retail price, less cost of handling, goes to the first depositor of the goods.

If, instead of depositing goods, a member wishes to give a chattel mortgage on marketable property to remain in his possession, the exchange will issue to him certificates upon

which he will be required to pay at the rate of 2 per cent. per annum, with no foreclosure so long as he keeps up the interest.

The circulation of certificates is insured among the members by the agreement they make on entering the exchange. Being exchangeable for products of commercial value at the regular prices current in the community and representing actual goods, they will be accepted, it is reasoned, in the same way that ordinary business checks pass current. The certificate has the indorsement of the person to whom it is first issued, making him personally responsible.

It is not believed that the certificates will be counterfeited, since the penalty is the same as for counterfeiting any business paper, and since no two will be alike in name or amount. A further protection is in the fact that they have only a local circulation. The back of the certificate reads as follows:

"This certificate of deposit is not redeemable in legal tender, but receivable by the Labor Exchange Association in payment for merchandise, for all services, and for all debts and dues to the same, and it is based upon and secured by the real and personal property in the keeping of the Association.

"The property held for the redemption of this certificate cannot, as per charter, be mortgaged nor pledged for debts, nor can it be withdrawn, but may be exchanged by the Association for other property of equal value."

LABOR EXCHANGES. (See LABOR EXCHANGE, THE.)—Labor exchanges are being established by the governments (municipal or State) of some countries, and particularly of France and Italy. The demand in France for a labor exchange (*Bourse de Travail*), hinted at by M. de Malmain in 1846 and developed in the Revolution of 1848, led under the Third Empire to the opening of a general registry for workmen. This, however, they did not patronize, and it came to nothing. In 1887, however, the Paris *Bourse de Travail* was founded and was given an annual subsidy of 150,000 francs, and an old building in the Rue Jean Jacques Rousseau. In 1892 a fine new building was provided in the Rue Château d'Eau, at a cost of 3,000,000 francs. Lit by electricity, heated and commodious, it became the headquarters of over 200 unions, but was finally closed by the Government in 1894, owing to its having become a headquarters for socialism. In different parts of France these labor exchanges are reported to have been established. (See UNEMPLOYMENT.)

Italy has done as much.

"The agitation," writes Sir Dominic Colnaghi in his report upon Italy for 1893, "which began nearly four years ago, in favor of the establishment of labor chambers or exchanges in Italy, has been so far successful that chambers have been provided at Milan, Turin, Piacenza, Micerata, Venice, and Bologna; while at Rome, Genoa, Florence, Verona, Brescia, Pavia, Spezia, and Como active steps are being taken toward their organization, with, however, varying success. In other centers, also, preparatory committees are stated to have been formed to study and promote the same object." The report of the Central Committee of the *Partito dei Lavoratori* to the Zurich International Congress mentions further that labor chambers have been started at Parma, Cremona, and Padua, while efforts are being made to found others at Naples and at Bergamo.

The chambers aim at—

1. The organization of the working classes in sections according to their different trades.

2. The promotion of the technical and general education of the operatives.

3. The formation of committees of arbitration for the settlement of disputes between employers and employed.

They also act as labor registries, and procure work for the unemployed. At present they confine themselves to industrial functions, and do not concern themselves with political questions. "But if, with the advance of the labor movement, greater power should be thrown into their hands, it may become doubtful how long this position of political neutrality will, or perhaps can, be maintained." Indeed, the program of the *Partito dei Lavoratori* shows that they are already beginning to desire political power.

The labor chamber of Milan is by far the most important of those already established. In March and April, 1890, the various working men's associations of Milan discussed and approved the statutes of a proposed labor exchange, to be composed of all the Milanese societies that gave in their adhesion, formed in separate sections of crafts and trades. The matter was referred to a committee, and, among other points, the question was discussed whether it would be advisable for the Municipal Council of Milan to encourage the foundation of a labor exchange in the city. The committee viewed the establishment of the exchange with favor. On their proposal the municipality granted a subsidy of 15,000 lire, to be voted annually, and placed at the disposal of the exchange a wing of the castle, containing about 80 rooms and a large hall.

The proposed labor chamber was actually started at Milan toward the end of September, 1891.

LABOR LEGISLATION.—(For a discussion of the principles involved, and for an outline of English labor legislation, see **FACTORY LAWS**, as such legislation is usually termed in England; for special departments of labor legislation, see **CONSPIRACY LAWS**; **SHORT-HOUR MOVEMENT**; **STRIKES**, etc.) We consider here in brief labor legislation in the United States. It seems to have begun in Massachusetts, when, in 1836, a bill was passed regulating the education of youths in factories. Agitation for short-hour legislation had preceded, but no general legislation was enacted in Massachusetts till 1874 (see **SHORT-HOUR MOVEMENT**), tho in 1842, due to the efforts of Horace Mann (*q. v.*), the hours of children under 12 were limited to 10. In 1866 commenced the agitation in Massachusetts for a Labor Bureau (*q. v.*). Other States have slowly followed. Mr. Carroll D. Wright (*Industrial Evolution of the United States*, pp. 291, 292) says:

"Looking broadly now to the labor legislation as it has occurred in this country, it may be well to sum up its general features. Such legislation has fixed the hours of labor for women and certain minors in manufacturing establishments; it has adjusted the contracts of labor; it has protected employees by insisting that all dangerous machinery, hoistways, etc., shall be guarded; it has prescribed that fire-escapes in factories and tenement-houses shall be erected; it has prohibited unsafe elevators; it has created boards of factory inspectors, whose powers and duties have added much to the health and safety of operatives; it has in many instances provided for weekly payments, not only by municipalities, but by corporations; it has guarded the health of women employed in manufacturing, mechanical, and mercantile establishments by requiring seats for their use; it has regulated the employment of prisoners; protected the employment of children; exempted the wages of wife and minor children from attachment; established bureaus of statistics of labor; provided for the ventilation of factories and workshops; established industrial schools and evening schools; provided special transportation by railroads for working men; modified the common-law rules relative to the liability of employers for injuries to their employees; fixed the compensation of rail-

road corporations for negligently causing the death of employees, and has provided for their protection against accident and death. Under it factory doors cannot be locked during working hours; it has established boards of arbitration: it has regulated, with more or less success, the pernicious custom of truck stores, and it has prohibited the employment of women and minors in manufacturing establishments between the hours of ten o'clock at night and six o'clock in the morning. All these provisions are not found in the statutes of all the States, but they are so general as to entitle them to be considered in the body of labor legislation."

References: See Appendix.

LAFARGUE, PAUL, was born at Santiago, Cuba, in 1842. Studying medicine in Paris, he took part in the Commune of 1871, and then fled to Spain and England, where he married a daughter of Karl Marx. In 1880, with Guesde (*q. v.*), he organized Marxist socialism in France, since which date Socialism of this type has steadily grown in France. (See **FRANCE AND SOCIAL REFORM**.) Lafargue was imprisoned in 1883 and again in 1891, but was liberated on being elected to the Assembly from Lille, tho in the next election defeated. He has written *Le matérialisme économique de Karl Marx* (1884); *Le Droit à la Paresse* (1887); *The Evolution of Property* (1891); *Le Socialisme utopique* (1892).

LAMENNAIS, HUGUES FÉLICITÉ ROBERT, ABBÉ DE, was born in 1782 at St. Malo, France, the son of a ship-builder. At first skeptical, the materialism of France drove him to the Church, and he received the tonsure in 1811 and the priesthood in 1817. He became a teacher at St. Malo. Supporting monarchy, he attacked Napoleon, and was compelled to flee to England. Returning to France, he published his *Essai sur l'Indifférence en Matière de Religion*, 4 vols., 1817-20, and other works. In 1830 he founded the journal *L'Avenir*, with the motto, "God and liberty, the Pope and the people." He had many disciples, among them Lacordaire and Montalembert. Denounced at Rome, in 1831 he went to Rome and waited seven months in vain for an audience with the Pope. His faith shaken by what he saw, he hovered between Romanism and democracy. On August 15, 1832, a papal encyclical indirectly condemned *L'Avenir*, and drove Lamennais from the Church. After living for a while in silence, he startled the world in 1834 by his burning *Les paroles d'un croyant* (The Words of a Believer). In this he declares Christianity to be love and service, and the French Church to be opposed to this. The Pope condemned this, and Lamennais answered in his *Affairs de Rome* (1836). In his *Le Livre du Peuple* (1837); *Esquisse d'une Philosophie* (3 vols., 1841-43); *De la Religion* (1841); *Du Passé et de l'Avenir du Peuple* (1842), he appeared as "the prophet of democracy," and of the alliance of Christianity and socialism. In 1839 he published a pamphlet, for which he was imprisoned 12 months. In 1848 he was elected to the Constituent Assembly, but after the *coup d'état* he withdrew from public life and died in 1854, rejecting to the last all overtures of the Church, and was buried, in accordance with his will, in a nameless grave at Père la Chaise. His passionate belief was that religion is the root of all true progress in all as-

pects of life—in manners, politics, art, science, philosophy. He, like Mazzini, laid emphasis upon duties rather than rights. He asks why it is that the people have not conquered their rights and held them fast, seeing that the privileged classes are so inferior in numbers; and the reason he assigns is that while the people have in their hands that which overthrows, they have not had in their hearts that which builds up. He believes in violence no more than Tolstoi. "Do good," he writes, "by good means. Do not confound the strength wielded by justice and charity with the brute force of ferocity and violence. When fraternity shall be in the hearts of the people, it will not be long before it finds its way into their laws."

LAND.—We consider in this article the land problem as it presents itself to-day in civilized countries, considering (1) the development of modern forms of land tenure out of the past; (2) the actual facts of the ownership of the soil to-day; (3) the results of these conditions on social life, industrial, political, and moral; (4) the question of how far land reform can be conducted without radical change in existing systems of land ownership; (5) the various propositions for radical change. (For fuller consideration of subsidiary points in the history of the past and the facts of the present, see PRIMITIVE PROPERTY; MARK; MANOR; MIR; COMMUNISM; FEUDALISM; MIDDLE AGES; METAYER; AGRICULTURE; FARMERS' MOVEMENT; SLUMS; TENEMENTS; MORTGAGES; WEALTH. For a discussion of the economic principles entering into the land question, see RENT; WAGES. For fuller development of the various proposals for reform on the land questions, see ANARCHISM; COMMUNISM; COOPERATIVE FARMING; LABOR COLONIES; SINGLE TAX; SOCIALISM.)

I. THE DEVELOPMENT OF MODERN CONDITIONS.

Land at the beginning of human history was wholly unappropriated. It was owned neither individually nor communally; it was not owned at all. Men roamed over its surface obtaining a precarious living from berries, nuts and roots, hunting and fishing. Each man helped himself to what he would and what he could. The world was a No Man's Land. But the preservation of life compelled the weak to seek protection by placing themselves under some strong leader. Leaders were glad to protect those who would slave for them; the rearing of the young compelled some sort of a more or less permanent habitation and defense from attack of man and of beast. Consciousness of kin and of kind drew men together; struggle to live led men to hunt in bands, and later to till the soil; gradually property arose. Then land became appropriated, but under what forms is a matter of debate. One school of thought—led notably by Laveleye (*q.v.*)—has found in the forms of modern savage life, in the remnants and traditions of the Russian *mir*, the Javan *desa*, the Indian communal village, the Slavic communal families, the German *mark*, the Swiss *allmend*, the English *manor*, the Greek and Roman public feasts, the family com-

munities of various out-of-the-way sections of Western Europe, evidence of a primitive communal holding of land, where little groups of men and women, perhaps patriarchal families, appropriated land collectively and tilled it for the common good. This view has been sharply criticised, notably by Fusté de Coulanges (*q.v.*). It is argued that the evidence does not prove a primitive communism, but rather a primitive slavery, land being held, perhaps by tribes, but not by communal tribes; rather by despots, tyrants, bullies, who, with the aid of their minions, would seize and defend and till certain portions of the soil. Perhaps the true view is midway between these two extremes. The horde or the patriarchal family (*q.v.*) was undoubtedly the first unit that owned land; but this was probably anything but a democratic unit or a communal colony. Slave labor, the wife or wives perhaps being the first slaves, undoubtedly first tilled the soil in large and permanent ways. Babylon, Egypt, Persia, rested on slave labor, toiling for lords of the soil, who in turn followed despotic kings defended by slave armies. Out of this condition in Japan, China, and through Asia generally, a serfdom gradually developed, following in a rude way the feudal forms we best study in Europe. Japan (*q.v.*) has only very recently thrown off feudalism. Outside of civilized countries the land is yet held to-day by savage tribes, by feudal lords or by men under despots, as in Mohammedan countries, despised and tyrannized cultivators of the soil.

It is in Greece and Rome that we find the real beginnings of individual ownership of land. In Greece, the city-State was supreme. It conquered the land and parceled out the territory among the free citizens, the assignments being tilled by slaves. Mines and some lands were held by the State, however, and worked for the State by slaves. Rome began in the same way. Two *jugera* (1½ acres) were originally assigned to each household. Households were combined in *gentes* and the *gentes* in the State. The State, however, held some land, and perhaps rented some of it.

Cicero (*De Rep.*, ii., XIV.) says that Numa was the first who divided the conquered lands into private shares, but it is certain that the example was only partially followed. But by the time of Servius Tullius the original private portion of many households must have been greatly but unequally enlarged, for his new military organization was based on the obligation of service imposed on the freeholders (*assidui*) as distinguished from the mere laborers and breeders of children (*proletarii*).

Class distinctions based on land ownership thus early began. The wealthy had their lands tilled by slaves. The poor land-owners, unable to sustain themselves, hired themselves as laborers or sold themselves or their children into slavery. The taxes were farmed out, and the system admitted of great extortion. Finally the poorer citizens rebelled; they assembled on the Mons Sacer and threatened Rome. It was the commencement of the long struggle over agrarian laws.

The object of these laws is well illustrated in the Licinian law (387 A. U. C.). It enacted that

Primitive Property. found in the forms of modern savage life, in the remnants and traditions of the Russian *mir*, the Javan *desa*, the Indian communal village, the Slavic communal families, the German *mark*, the Swiss *allmend*, the English *manor*, the Greek and Roman public feasts, the family com-

no citizen should hold more than 500 *jugera* of the public lands; that no one should graze more than 100 oxen and 500 sheep on the common lands; and that every land-owner should be obliged to employ a number of free laborers proportioned to that of his slaves.

Such laws pacified the people for the time, but had little permanent effect.

Successful wars gave a temporary outlet to labor in the formation of agricultural colonies, but at the same time immensely increased the number of slaves, who were treated as mere beasts of toil, to be worked out or sold off when no longer profitable.

Great estates tilled by slaves grew. The Gracchi demanded a distribution of the State lands among the people, but the demand was stifled in blood. Later, Julius Cæsar to an extent yielded; but it was too late. Great estates created an aristocracy. The aristocracy culminated in imperialism.

Rome.

The Roman Empire grew corrupt with a few great owners of the soil in power and luxury, and the mass of the people enslaved and poor. Pliny's famous utterance sums it up: "*Latifundia perdidere Italianam*" (*Natural History*, 18. 6. 7. § 35. "Great estates overthrew Italy!"). Then the Goth came.

The exact connection between the Roman system and feudalism is not fully clear. The origins of feudalism itself are disputed (see FEUDALISM); but the great Roman villas, tilled by poor freedmen dependent on their lords, as well as by slaves, undoubtedly contributed at least somewhat to feudalism. Gradually under feudalism, and partly due to the Christian Church, (see CHRISTIANITY AND SOCIAL REFORM) chattel slavery disappeared in Europe, but the slaves and poor freedmen became serfs of the soil, entitled to some rights, but tied to the villa or manor, and compelled to render service to the lord of the soil. The *mark* (*q.v.*) had been previously the typical organization in German land tenure. It is disputed just how it was organized, but it was probably in general a tribal organization under its most democratic form. Cicero says (*De Bell. Gall.*, vi.) of the Germans of his time:

"They are not much given to agriculture, but live chiefly on milk, cheese, and flesh. No one has a fixed quantity of land or boundaries of his property, but the magistrates and chiefs every year assign to the communities and families who live together as much land and in such spots as they think suitable, and require them in the following year to remove to another allotment. Many reasons for this custom are suggested; one is that they should not be led by permanence of residence to renounce the pursuits of war for agriculture, another that the desire of extensive possession should not induce the more powerful to seize the land of the weaker, another that they should not construct their houses with greater care to keep out heat and cold, another that the love of money should not create parties and disputes, and lastly that the mass of the people might remain contented with the justice of an arrangement under which every one saw his position as comfortable as that of the most powerful. As to the tribes themselves, their chief glory is to have their territory surrounded with as wide a belt as possible of desolated waste. They deem it not only a special mark of valor that every neighboring tribe should be driven to a distance, and no stranger should dare to reside in their vicinity, but at the same time they view it as a measure of precaution against the risk of sudden attacks."

Tacitus describes it later in the same general way. Perhaps out of this organization, blending

with the Roman system, came feudalism. As the Carolingian Empire arose and then dissolved, the various kings would assign different portions of their kingdom to the great barons to rule over and defend. They would similarly subdivide their territories, and this would produce feudalism. The system seems to have first arisen in Germany; but in England it is best studied, particularly in tracing its development into modern conditions, because in Germany various systems, as we shall see, existed side by side, while in England the development is clearer.

Alfred Russel Wallace (*Land Nationalization*, pp. 22-25) has summed up in a few lines the essence of feudalism as far as land tenure is concerned, and its development into modern English landlordism. He says:

"The actual system of land tenure and all existing rights of property in land of this country may be said to have originated at the Norman Conquest, when the whole land of the kingdom became vested in the crown. All the great landed estates were then granted as fiefs by the sovereign, and their holders were obliged to render military and other service proportionate to the extent and population of their lands. These estates were also subject to various fines, on marriage or on transmission to an heir; they were not allowed to be sold or alienated without the permission of the sovereign; and on the death of the owner without heirs the whole reverted to the crown. Any breach of fealty or the commission of any act of felony also entailed the loss of the estate. The great vassals were usually endowed with civil and criminal jurisdiction over the inhabitants of their estates, and were altogether more in the position of subordinate rulers than mere landlords in the modern sense of the term.

Feudalism.

"These immediate vassals of the crown again granted lands in fief, on various payments or services, and in process of time these fiefs were allowed to be divided or sold, and the payment or service to be commuted for fixed sums of money. . . .

"The lords of the soil were the chiefs and protectors of the community which lived on their estates, while every individual, down to the villein and serf, possessed definite rights and privileges in connection with the land, which, though they might be infringed by force or rapine, were fully recognized by custom and law.

"But as time rolled on this system became modified in a variety of ways, the always for the benefit of the lord and to the injury of the inferior landholder. As the king obtained more power and the attractions of court life became greater, the nobles and great land-owners came to look upon their estates chiefly as sources of revenue to be spent in the capital or in foreign lands. The employment of foreign mercenaries and the rise of standing armies enabled the king to dispense with the military service of his vassals, and by self-made laws this and other burdens on the land were gradually thrown off, and were replaced to a great extent by taxes on the mercantile and landless classes. The ingenuity of lawyers and direct landlord legislation steadily increased the powers of great landowners and encroached upon the rights of the people, till at length the monstrous doctrine arose that a landless Englishman has no right whatever to the enjoyment even of the unenclosed commons and heaths and the mountain and forest wastes of his native country, but is everywhere, in the eye of the law, a trespasser whenever he ventures off a public road or pathway. The lord of the manor is said to be the owner of the soil, and the surrounding freeholders and copyholders have certain rights of pasture, fern or turf cutting; but the dwellers in the adjacent towns and villages, and all who are mere Englishmen, have no rights whatever, so that if the two former classes agree the common can be (as hundreds of commons have been) enclosed, and divided among them. It has thus come to pass that at the present day the owners of land, whether acquired by inheritance or purchase, treat it solely as so much property to be made the most of, quite irrespective of any rights in the people who live upon it. They now claim a power which no government, however despotic, has ever openly claimed—that of treating the land exclusively as a

source of personal wealth, to which they have an inalienable right, even at the sacrifice of all that the people who live upon the land hold most dear."

This, however, is too general to show all the injustice of the process.

Mr. S. W. Thackeray, in his *The Land and the Community*, brings this out more clearly by tracing the legal development. He says:

"Let us suppose ourselves, then, living in the time of one of our Norman kings, when the feudal system has been established and the land has been parceled out in great estates to tenants in capite holding their fiefs directly from the king. The first thing which such a tenant does on taking possession of his fee, is to divide or cut up his estate into portions, each one embracing a considerable area, and including, perhaps, many separate villages and townships, and these he sub-infeudates, as it was called, to his followers on similar conditions of tenure and service to those he is himself under obligation to the king. Such a portion of an estate became known as a 'manor,' and the owner was styled 'lord of the manor.' . . . What kind of system, we may ask, then, did the lord of the manor find in vogue among the people who became his dependents, and who formed one of these village communities? It has been thus described:

"The 'mark' or territory occupied by the community was divided into the following parts:

"1. The township, where were the houses held by heads of families in severalty.

"2. The arable land divided into several plots, but subject to regulations as to common cultivation—the most usual of which is the three-field system; the land was to lie fallow every third year, and the whole community had rights of pasturage on the fallow portion, and on the stubble of the fields under crop at certain portions of the year between harvest and the following seed-time.

"3. The meadow-land, which in like manner was common for a period after the hay harvest, and was afterward fenced off in separate allotments for the new crop.

"4. The common or waste land not appropriated for cultivation, and over which every member of the community had rights of pasturage, wood-cutting, etc.

"On some such system as thus described the lord of the manor engrafted his new arrangements. Out of the lands which had been granted to him, the lord would grant certain portions to free tenants on condition of certain rents and services, and these are called the *freeholders* of the manor. The lord's own portion would be cultivated by villeins or serfs attached to the soil, and these ultimately developed into the important class of *copyholders*. There would remain in addition the uncultivated and unappropriated land, over which the freeholders had certain rights of common, supposed to be incident to their original grant."

The most important right of common is common of pasture. Some lands were subject to this common of pasture during certain portions of the year only—*e.g.*, in the case of Lammass-lands from the 1st of August for eight months, after which they are held in severalty. Such lands are said to be *commonable*. Then there is common of piscary or the right of fishing in a particular stream; common of estovers is the right of cutting wood on another's estate; common of turbary is the right of cutting turf. In some manors there was also a right of digging and taking coals, minerals, etc.

"These rights of common needed for purposes of law to be further defined. They were *appurtenant* when inseparably annexed to the land; *appurtenant* when they belonged to it, but not of necessity. It was common *in gross* when the right was annexed to the person of an individual and not attached to the land; and it was *common of vicinage* when it existed between the inhabitants of two adjacent townships. Subject to all these rights of common, everything belonged to the lord of the manor.

"This unaccustomed view as to the origin and extent of their common rights, as it was officially and judicially expounded to them by the lord of the manor in his court baron, could scarcely have been altogether acceptable to the common people. But the Statute of Merton passed in 1235 gave full legal sanction to what had previously been regarded as an encroachment on the rights of the commoners. . . . The thirteenth century was marked by very much important legislation in reference to land. During the first three quarters of it the crown was held by the feeble hands

of John and his son, Henry III., and the course of legislation showed a marked tendency in favor of the landowners gaining the upper hand. But on the accession of Edward I., in 1272, a great reaction took place. There was a very visible retightening of the grasp of the feudal system over the nobles, in striking contrast to the relaxing hold of the crown as exhibited in the hands of his two predecessors.

"In 1215 Magna Charta decreed that no freeman should be deprived of his life, liberty, or property, except by the law of the land and the judgment of his peers. In 1225 it was enacted that no land shall be aliened so that the lord shall thereby lose any service due him. In 1235 the Statute of Merton opened the door to the encroachments of the landowners on the common wastes, and in 1285 it was opened still wider by the Statute of Westminster the Second.

"But in the last quarter of the century the new era of reactionary legislation was entered.

"Besides several acts of less importance, there was in 1279 the second Statute of Mortmain, which prohibited the conveyance of land to religious houses. Then in 1285 the famous Statute 'De Donis conditionalibus' (13 Edw. I., c. 1) originated estates tail, compelling the donee to carry out the will of the donor, and forbidding him to alien the estate after an heir had been born to him, and it also secured the ultimate reversion of the estate to the donor on the failure of issue to the donee. Entails made under this Statute 'De Donis' created a perpetual series of life estates, and initiated a policy which was afterward seen to produce very bad effects. In 1290, five years later, in pursuance of the same general policy as in De Donis, another famous statute, 'Quia Emptores,' was passed to check the growing practice of sub-infeudation. This was in the nature somewhat of a compromise. For whereas previously the alienation of lands without the lord's consent had been only connived at, it was now legally permitted for feudal tenants to alien their lands without their lord's consent; but it required the assignees to hold immediately from the lord and not mediately through the tenant, and so the lord's rights were saved from being prejudiced. In 1326 the same right of alienation was extended to tenants in capite on payment of a 'fine.'

"The fourteenth and fifteenth centuries were too much disturbed by foreign wars and by the civil wars of the Roses to have left much opportunity for attention to legislative matters. . . . Previous to the time of Henry VIII., a simple gift of land to a person and his heirs, accompanied by livery of seisin, gave to that person an estate in fee simple. As early as the time of Henry III. Statutes of Mortmain were enacted prohibiting land from being given to the religious houses. In order to avoid the effect of this statute, a feoffment was made to one person to hold the land to the use of another. The Courts of Chancery held that the feoffee was, in such a case, bound in conscience to hold the land simply for the benefit of the third person. This estate to use was not recognized in law, but only in equity. The original feoffee was, in the eyes of the law, the real owner. There were thus two estates, a legal and an equitable, in the same property cognizable in two different courts. By this device, many of the rules of property were defeated. In law, only the legal owner could be reached. Clergy could hold land in spite of the Statutes of Mortmain. A refractory lord, holding his property only as equitable owner, could commit treason with impunity and without the forfeiture of his estate, and persons could also dispose of their land by will. The land itself could not be devised, but the use of it was, and the legal owner was bound in equity to observe such use. Down to the time of Henry VIII. this practice had so increased that by its means a considerable part of the kingdom had contrived to get rid of some of the worst inconveniences of feudal tenure.

"In order to remedy this state of things, Henry VIII. caused the Statute of Uses to be enacted in 1535. It decreed that any person for whom a use was held should be deemed the legal owner of the estate to the extent of that use. The equitable was thus converted into a legal estate, and was made subject to all the incidents of legal ownership. Thus once again apparently had the crown succeeded in reestablishing its feudal fetters upon the land. Its triumph was destined, however, to be of short duration. The feudal system was no longer suited to the changed character of the times, and the growing spirit of freedom could no longer be curbed by its restraints. And therefore again the ingenuity of landowners and churchmen was stimulated, and, aided by the lawyers, they succeeded in finding means for another fraudulent eva-

Feudal Times.

lution in reference to land. During the first three quarters of it the crown was held by the feeble hands

sion of the law. And the Court of Equity was again successfully invoked to their aid in giving validity to their legal fictions.

"So, strange to say, by narrow construction of the words of the Statute of Uses the purpose of the enactment was completely foiled. An estate was now limited to A and his heirs, to the use of B and his heirs, to the use of C and his heirs. The court held that the first use was executed by the statute and B was the legal owner, but then at this point the power of the statute was exhausted. Thus C remained the equitable owner, as B would have been before the statute was passed. Such an unexecuted use is now termed a trust. One very important effect, however, the Statute of Uses had which renders it noteworthy. The machinery that had been employed in the creation of the use, thus legalized, was adopted for the transfer of land by deed without publicity or registration; and this remarkable result has continued even down to the present day.

"The last great blow, which may be said to have been almost the finishing stroke, to the feudal system was the passing of the Statute of Wills. This was enacted in 1530, only five years after the Statute of Uses. This act is commonly said to have given, but it in truth only *restored* the power to devise lands by will. This had existed before the Norman rule, and had been extinguished only by the practice of primogenitary descent, with which it was of course incompatible.

"The feudal system was swept away by an act of the Long Parliament passed in 1656, and solemnly reenacted after the restoration in 1660. The famous statute (12 Chas. II., c. xxiv.) operating retrospectively turned all military tenures into 'free and common socage' from February 14, 1645. Thenceforth freehold tenancy has been virtually equivalent to ownership, and the only restrictions to which it is subject are those which may be created by will or deed. . . .

"Now, however, feudal tenures being finally abolished, we see the class of great landowners proceeding to introduce a new mode of settling estates, which depends not on any single statute or law, but on custom mainly, which takes advantage of legal forms already existing, and ingeniously proceeds to twist them about to serve other and quite different purposes than those for which they were originally intended. . . . There was, unobserved and but little noticed by the many, a marked change which took place in the policy of the great landowners, at this period, and the fact that this change was not shared in, to any considerable extent, by the owners of the smaller estates in land, the class of small freeholders and copyholders, is very suggestive, and full of a grim significance.

"For, notwithstanding this change, there was not lacking a very clear and distinct connection between the new and the old policies. There was an unmistakable unity of aim and purpose, which was not at once revealed, we may readily believe, even to the landowners themselves, but which gradually took shape as events favored its development. It would be unfair, perhaps, to suggest that the landowners having now entirely freed themselves from the thralldom of the feudal system, and emancipated themselves from the power and control of the sovereign, perceived that they had at the same time given a death-blow also to the rights of the community in the land, which had already gradually ceased to be represented, except in theory only, in the person of the king, as the representative of the State. And thus having now acquired the absolute and exclusive right of ownership over whatever lands they possessed, while, on the one hand, they took careful measures to prevent their own estates from dispersion or encroachment, they were now ready on the other hand to use their newly enfranchised power and undistracted opportunities to search for means whereby they might gratify a spirit of insatiable greed by swallowing up whatever other lands of smaller estates or of common lands not yet enclosed which the wheel of fortune might at any time bring within their grasp. It would not be fair, we say, to suggest that this was their deliberate aim, but if such a theory were put forward, it would not be difficult to find many facts in subsequent history which would tinge it with some color of truth.

"It is not, perhaps, necessary to enter into the details of the system of family settlements. By it the property in land was divided out to several persons with 'estates for life' and 'in remainder,' so as to prevent the possibility of alienation until not only the whole of the lives existing at the time of making the settlement or will had ended, but until the unborn child of one who was then an infant had attained 21 years of age; so in fact as to extend entail ordinarily for 50, but pos-

sibly for 80 or 90 years. In common parlance, estates in land may be settled upon any number of lives in being, and 21 years afterward.

"In this way each son when he succeeds finds himself merely a tenant for life, and as such possessed of no power to prevent his own son from becoming owner in fee simple, with full power to deal with the estate when he in turn shall succeed. But a father so situated is little inclined to leave to his son powers of which he himself is deprived, while his son is generally willing to barter his future liberty for a present liberal allowance. Thus father and son strike a bargain; the father buys the son's surrender of his future right, and the son, for a price, agrees to submit himself to the restraints of being merely tenant for life instead of in fee simple when his father shall die. The process repeated from generation to generation has reestablished in practice the system of entails which the courts had formally abrogated as contrary to public policy, and which every writer has denounced as hurtful to the nation.

"While these successful means were being continuously taken for the preservation of the large estates in a few families, let us now see what was going on in those smaller estates which had thus far escaped absorption, and in those common lands which formed the remainder of the estate that was left to the community at large.

Entail.

"The system of entails, or of creation of estates for life only, which has now prevailed for six centuries in England, is sufficient to account for the fact that the large estates have continually augmented in size and number, by corresponding absorption of the small properties of yeomen. The small properties are seldom subjected to strict settlement. The owners occasionally fall into difficulties, and then their land is sold to pay their debts. They are frequently moved by natural affection either to divide their estates among all their children or to subject them to charges for children other than the heir, and this also tends to bring them into the market for sale. The large properties therefore continue undiminished; and when a small adjoining freehold comes into the market, it is seldom that the owner of the larger estate cannot find the money to effect its purchase. Once obtained it is included in the next settlement of the larger estate, and thus permanently withdrawn from the operation of natural processes of disintegration.

"On the whole, it follows that large estates tend to grow, and in precisely the same proportion small ones tend to disappear. The peers, in number about 600, hold rather more than one fifth of all the land in the kingdom. One half of the whole territory is in the hands of only 7400 individuals; the other half is divided among 312,500 individuals. Barely one person in 100 owns more than an acre of soil."

But even the legal aspect does not bring out the whole situation. When the custom grew up of the baron's making a money payment to the king in place of service, it involved more than first appears. The king welcomed the arrangement because it enabled him to hire a *standing army* rather than depend upon turbulent barons. The barons preferred it because they in turn could get money in place of service from their dependents, and so could go live where they would, *escaping duties, tho maintaining income*. But this was not all. The king, wanting more money, some one suggested that he get money not only from the barons, but from their dependents. It was overlooked or ignored that the dependents were already paying the king *through the barons*, and that the barons were only entitled to payment from their dependents *as representatives of the king*. The dependents thus found themselves now called upon to pay both the king and the barons. Even this was not all. When the barons found their dependents paying the king, they said, "This money is the king's; what money comes to us is ours." The king's payment they called *tax*; their payment they called *rent*—in other words, they set up the claim to own as properties, from

which they could collect rent, the lands they had been given simply to rule over for the king. In this process, disguised, often unconscious to the barons themselves, lies the genesis of the land ownership of modern England. Nor is even this all. Wars in the Middle Ages were fought by the nobility. But gradually the barons grew impoverished and needed money. The development of the Flemish wool market gave them an opportunity. Claiming to own the land, they began to enclose the commons, to evict the peasantry, and turn the land into sheep walks.

Eden, in his *History of the Poor*, gives a quotation from *A Compendious or Briefe Examination of Certain Complaints*, published in 1581, which would be humorous were it not pathetic. "Yea," it says, "these sheep is the cause of all these mischiefs, for they have driven husbandry out of the country, by the which was increased before all kinds of victuals, and now altogether sheep, sheep, sheep."

The landless class was also swollen by the evicted monks and nuns from the monasteries suppressed by Henry VIII. How many of these there were can be seen when it is remembered that good authority estimates one third of the whole of England at this time to have been church land.

Nor is the enclosure of commons by any means a practice of the past alone. It ended in that form, but later took the form of reclaiming waste land. Under the Georges, enclosure became a settled policy. Some 2000 enclosure bills were passed before the General Enclosure Act of 1801, and about 2000 more before the act of 1845. Lawrence's *New System of Agriculture*, published in 1726, states that "it is believed that one half part of the kingdom are commons, and a third of all of the kingdom is what we call common fields." In 1879 only 264,000 acres were common out of 32,597,398 acres.

Says Mr. Thackeray (*idem*, p. 47):

"The annual report of the Enclosure Commissioners for 1867 shows that during the 150 years previous no less than 7,660,413 acres were added to the cultivated area; that is, about one third of the total of 25,457,626 acres in cultivation in that year. The commissioners remark that such enclosures, being often made without any compensation to the smaller commoners, have deprived agricultural laborers of ancient rights over the waste, and disabled the occupants of new cottages from acquiring new rights.

"Nor must it be supposed that the number of landed proprietors was in any way increased by this process of enclosure. The area enclosed was divided among those, and those only, who already possessed common rights by virtue of their holding freeholds or copyholds, and the very idea of recognizing in law any public interest in open wastes or forests is entirely modern. The lion's share was always reserved for the lord of the manor, and immense accessions of territory were thus secured by powerful landowners in days when the landed interest was paramount in the Legislature no less than in local administration. The chief sufferers at the time were poor laborers, holding cottages at will of their landlords, who lost the privilege of turning out pigs, geese, and fowls on the common, and for whom, of course, no compensation was provided, or even thought of."

Such is the way that English land property has been developed by encroachments on the rights of the people. Not even yet does the law recognize full private property in English land, but in practice it is only too real.

Sir Frederick Pollock says in *English Land Laws*:

"It is commonly supposed that land belongs to its owner in the same sense as money or a watch; this is not the theory of English law since the Norman Conquest, nor has it been so in its full significance at any time. No absolute ownership of land is recognized by our law books, except in the crown. All lands are supposed to be held immediately or mediately of the crown, the no rent or services may be payable and no grant from the crown on record."

Williams says (*Real Property*):

"The first thing the student has to do is to get rid of the idea of absolute ownership [of land]. Such an idea is quite unknown to the English law. No man is in law the absolute owner of lands (p. 16).

"All landowners are merely tenants in the eye of the law" (p. 55).

Public sentiment, however, is alive on this question.

Says Mr. Thackeray:

"The first sign of an awakening of the public mind to a consciousness of the true meaning of what was going on was in 1836, when in an enclosure act of that year it was stipulated that no enclosures should be made within 10 miles of London or within corresponding distances of smaller towns. Next, in 1845, when the General Enclosure Act was passed, which applied to all 'common lands,' it was enacted that manorial wastes must not be enclosed without the previous sanction of Parliament. In 1852, a later act made the consent of Parliament necessary in all cases under the Enclosure Act.

"Under these various acts, however, in spite of these restrictions, the enclosures which were still permissible proceeded apace, and the commissioners have been not undeservedly accused of unduly favoring enclosure and neglecting the powers with which they were entrusted for the protection of the public. There seems to have been very good ground for this charge. For the Home Secretary in 1876 stated that out of 474,000 acres which had been enclosed under the act of 1845, less than 4000 had been dedicated to purposes of recreation and exercise; and he admitted that whereas enclosures had formerly been treated as a private estate, improvement to which the owner was entitled, a great change of opinion had taken place as to the rights of the public."

This brings us to the present. The development of land property in other countries, so far as it differs from the English development, we consider in speaking of each country. The English theory has been copied in the main in the United States and Australasia. Wherever Englishmen have discovered land they have claimed it for the Crown, and the Crown has assigned it for the most part in fee simple to companies or to individual proprietors. Titles in the older States of the United States originated in this way. William Penn purchased land from the Indians, but it was assigned to proprietors by the Crown, and Pennsylvania became a proprietary colony. In most of the colonies charters were given to companies, and these companies gave land to individuals. Since the Revolution, the Federal Government has been the owner of all land not already owned by individuals, but has sold it to settlers, under the Homestead Act, for a song, or has given it to towns, States, or railroads. In English colonies all land is held from the Crown. We come now to consider

II. THE PRESENT CONDITION OF LAND OWNERSHIP.

In Great Britain to-day ten elevenths of the area of the United Kingdom is owned by one two hundredths part of the population (Mullhall's *Dictionary of Statistics*, p. 266). According to the *Encyclopædia Britannica*: "By the

Doomsday Book of 1875 it appeared that one fourth of the total acreage (excluding plots under one acre) is held by 1200 owners, at an average for each of 16,200 acres; another fourth by 6200 persons, at an average of 3150 acres; another fourth is held by 50,770 persons, averaging 380 acres each; and the remaining fourth by 261,830 persons, averaging 70 acres each (Caird). Peers, in number about 600, hold rather more than one fifth of all the land in the kingdom. Thus one half of the whole territory is in the hands of only 7400 individuals; the other half is divided among 312,500 individuals."

This means that not one man in a hundred in Great Britain owns an acre of land; and let us see what this means. We quote from *Land Nationalization*, by the celebrated scientist, Alfred Russel Wallace, whose authority and fairness none can question. He says (chap. v.):

"In England pure landlordism is seen at its best. Its characteristics have been determined by the great and popular class of country squires and by numerous wealthy peers owning large ancestral estates, who have usually lived among their tenants, have been accustomed to treat them liberally, and have had sympathy with their pursuits and a desire for their prosperity. The tenant-farmers, too, are usually men of some capital, of good education, and of independent spirit, who are able to understand their position and maintain their rights, and whose occupancy of the land is the result of a more or less free contract with the owner. It is impossible to imagine more favorable conditions for the trial of our actual land system; and we may safely assume that whatever evils we find to result from it here ought not to be imputed to the misconduct of individuals, but to the essential features of the system itself. There are, no doubt, certain remediable evils due to the laws of inheritance and the power of entail. These will probably soon be cured; but their removal will have little influence on those wider and more deeply seated effects of the system to which I shall here call attention."

Despotic Power of Landlords.—The Hon. George C. Brodrick, in his valuable and impartial work, *English Land and English Landlords*, speaks of the large resident landowner of a parish or district as being "invested with an authority over its inhabitants which neither the Saxon chief nor the Norman lord, in the fulness of his power, ever had the right of exercising." The clergyman is usually his nominee, and often his kinsman. The farmers, who are almost the only employers of labor besides himself, are his tenants-at-will, and, possibly, his debtors. The tradespeople of the village rent under him, and, even if they do not, could be ruined by his disfavor. The laborers live in his cottages, and are absolutely at his mercy for the privilege of hiring allotments, generally of inadequate size, and at an exorbitant rent as compared with the same land occupied by farmers, and they are also dependent upon him for work in winter. He is usually a magistrate, and thus has the power of the law in his hands to carry out his orders and enhance his authority. Except by his permission, merely to live upon his estate is impossible, while most of the inhabitants may have their lives rendered miserable or may be actually ruined by his displeasure.

"A great landowner exercises despotic power over individuals, such as we are accustomed to look upon with horror when occurring in the Turkish or Russian Empires. One or two illustrative examples only can be here given, but a little research through the columns of the daily press would enable any one to fill a volume with similar cases. Let us first choose an example of interference with religious freedom—a matter on which we more especially pride ourselves. In April, 1870, there appeared in the *Daily News* a correspondence between Samuel McAulay, a Wesleyan minister, and Langhorne Burton, a Lincolnshire landowner. The former asked that religious services which had been conducted for 30 years in the village of Bag-Enderby, and which the said landlord had interdicted, might be resumed, the writer urging his case forcibly, but in very respectful terms. The answer was [in part] as follows:

"The result of such a step on your part would probably be the removal from Bag-Enderby of all the members of your body, who are of little value to me as

tenants. I wish to have as tenants none (these italics are his own) but through church people, and consider myself quite at liberty to choose such as I like, without being dictated to by anybody. Reasons apart from this for my interdict of your meetings in Bag-Enderby I do not feel called upon to enter into with you. I also forbear to remark upon your seeming disposition to dictate to me my duty as a landlord."

England.

Eviction of the Inhabitants of an Entire Village.—In the following case, given on the authority of Mr. Froude, no offense whatever appears to have been alleged against the unfortunate tenants. He says: "Not a mile from the place where I am now writing, an estate on the coast of Devonshire came into the hands of an English duke. There was a primitive village upon it, occupied by sailors, pilots, and fishermen, which is described in *Domesday Book*, and was inhabited at the Conquest by the actual forefathers of the late tenants, whose names may be read there. The houses were out of repair. The duke's predecessors had laid out nothing upon them for a century, and had been contented with exacting the rents. When the present owner entered into possession it was represented to him that if the village was to continue it must be rebuilt, but that to rebuild it would be a needless expense, for the people, living as they did on their wages as fishermen and seamen, would not cultivate his land, and were useless to him. The houses were therefore simply torn down, and nearly half the population was driven out into the world to find new homes."

"Another mode in which private property in land operates to the serious injury of the public at large is the power which landlords possess, and very often use, of demanding enormous sums for the land required for public improvements. Whether it is the formation of new streets in the metropolis, or the construction of railways or docks, or the securing of land for public recreation, the claims of landlords invariably stand in the way, sometimes preventing the desired improvements from being carried into effect, sometimes burdening them with a heavy load of debt, and so diminishing their usefulness. Instances of this will occur to every one who takes note of passing events. I will only here quote the following statement of Mr. Brodrick:

"The landed interest of England is estimated to have received a sum exceeding the national revenue from railway companies alone over and above the market price of the land thus sold." The italics are mine, to call attention to the fact that this sum of 70,000,000 or 80,000,000 paid to the landlords is a permanent injury to the community, by increasing to that extent the unproductive capital expenditure of the railway companies of the kingdom; while no class has received so much benefit from railways as the landlords, in the enormous increase given thereby to the value of their estates, so that if they had freely given the land required to construct the lines, they would still have been gainers. As another example: "One nobleman is known to have received three quarters of a million sterling for the mere sites of docks constructed by the enterprise of others." Here again no doubt his other land in the neighborhood would be greatly increased in value by these very docks, and, equitably, all this increase of value should go to those whose expenditure caused it, or at least to the community at large. But the public and the Government are alike powerless, and must submit to pay whatever landlords choose to demand for permission to make public improvements."

If any one fancies that the day of such things has passed, let him still consult almost any English daily. He will find to-day men evicted for their political and other views. For an interesting case, see the *English Labor Annual* for 1896.

Landlordism in Ireland has not been worse, tho its worst developments have been till recently more common. To-day in Ireland (*q.v.*) the tenant is better defended than in England, Scotland, or the United States. Of the past Mr. Wallace says (chap. xiii.):

"Mr. T. P. O. Connor tells us that in the four years 1840-52 there were 221,845 evictions; whole townlands being depopulated, and their human inhabitants driven

out to make room for cattle and sheep, as being more profitable to the landlords. These poor people were often forced away from their homes, even tho' all rent due had been fully paid. The houses, which had been built by their own labor (or purchased from those who had built them), were pulled down; and when the houseless families, having nowhere to go, lighted fires in the ditches to cook some food, the fires were extinguished in order to drive them off the land. A report to the Poor Law Commissioners states that many occupiers were forced out of their homes at night in winter, even sick women and children not being allowed to stay in the houses till morning!

"And the power to do all this, be it remembered, is a necessary consequence of unrestricted private property in land. The following account of an eye-witness is taken from a published Pastoral Letter of the Roman Catholic Bishop of Meath:

"The horrid scenes that I then witnessed I must remember all my life long. The wailing of women; the screams, the terror, the consternation of children; the speechless agony of honest, industrious men, wrung tears of grief from all who saw them. I saw the officers and men of a large police force, who were obliged to attend on the occasion, cry like children at beholding the cruel sufferings of the very people whom they would be obliged to butcher, had they offered the least resistance. The heavy rains that usually attend the autumnal equinoxes descended in cold, copious torrents throughout the night, and at once revealed to those houseless sufferers the awful realities of their condition. I visited them next morning, and rode from place to place administering to them all the comfort and consolation I could. The appearance of men, women, and children, as they emerged from the ruins of their former homes—saturated with rain, blackened and besmeared with soot, shivering in every member from cold and misery—presented positively the most appalling spectacle I ever looked at. The landed proprietors in a circle all round—and for many miles in every direction—warned their tenants, with threats of direct vengeance, against the humanity of extending to any of them the hospitality of a single night's shelter. Many of these poor people were unable to emigrate with their families; while at home the hand of every man was thus raised against them. They were driven from the land on which Providence had placed them; and, in the state of society surrounding them, every other walk of life was rigidly closed against them. What was the result? After battling in vain with privation and pestilence, they at last graduated from the workhouse to the tomb, and in little more than three years nearly a fourth of them lay quietly in their graves."

Ireland.

Perhaps the worst landlordism has been in Scotland. Says Mr. Wallace (chap. iv.):

"Under the old system the Highland chief was a petty sovereign, who retained civil and criminal jurisdiction over his clansmen and the power of making war on other chiefs and clans. But these clansmen were never either serfs or vassals, but free men; and the clan was really a great family, all the members of which were supposed to be, and often actually were, of one blood. It was a true patriarchal system, totally distinct from the feudal system of Europe; and tho' every clansman owed fealty and military service, as well as certain dues or payments to his chief, these were given through love and duty rather than through fear, and every petty clansman held his land and his rights to pasture and wood and turf, and to hunt and fish over the mountains and lakes, by the same title as the chieftain held his more extensive lands and privileges. As well expressed by an able writer in the *Westminster Review*—'No error could be grosser than that of viewing the chiefs as unlimited proprietors, not only of the arable land, but of the whole territory of the mountain, lake, river, and seashore, held and won during hundreds of years by the broadsword of the clansmen. Could any MacLean admit, even in a dream, that his chief could clear Mull of all the MacLeans and replace them with Campbells; or the MacIntosh people his lands with MacDonalds, and drive away his own race, any more than Louis Napoleon could evict all the population of France and supply their place with English and German colonists?' Yet this very power and right the English Government, in its aristocratic selfishness, bestowed upon the chiefs, when, after the great rebellion of 1745, it took away their privileges of war and criminal jurisdiction, and endeavored to assimilate them to the nobles and great landowners of England. The rights of the clansmen

were entirely left out of consideration. . . . The full rights of possession given by the English law were now insisted on. The pasture of the hilltops, the game on the moors, the wood and the peat of the forests, the salmon in the rivers, and even the very shellfish and seaweed on the wild seashore, were declared the sole and exclusive property of the landlords. Then began the clearances and evictions dignified by the name of 'improvements.' By hundreds and thousands at a time the occupiers of the soil were driven from their homes, and were many of them forced to leave the country which they had so bravely defended on many a hard-won battle-field. . . .

"As to the nature and extent of this extermination Dr. Macdonald writes in the strongest manner. He says:

"The extermination of the Highlanders has been carried on for many years as systematically and relentlessly as of the North American Indians. . . . Who can withhold sympathy as whole families have turned to take a last look at the heavens red with their burning houses? The poor people shed no tears, for there was in their hearts that which stifled such signs of emotion; they were absorbed in despair. They were forced away from that which was near and dear to their hearts, and their patriotism was treated with contemptuous mockery."

"Again: I know a glen, now inhabited by two shepherds and two gamekeepers, which at one time sent out its thousand fighting men. And this is but one out of many that might be cited to show how the Highlands have been depopulated. Loyal, peaceable, and high-spirited peasantry have been driven from their native land—as the Jews were expelled from Spain, or the Huguenots from France—to make room for grouse, sheep, and deer. . . .

"Let us turn from this picture of what unrestricted landlordism has effected in the Highlands to that part of the country which is its pride and glory—the Lowlands. For here are the highest agricultural rents and the best farming in Great Britain. Here the landlords are wealthy and the farmers are thriving. Here everything is neat, thrifty, and elegant; the rude husbandry of the Highlands has been left more than a thousand years behind; the furrows are straight as an arrow, the fences closely dressed, the farmhouses commodious, and the gentlemen's seats bear all the evidences of taste, luxury, and refinement. Such being the case, we should naturally expect that some portion of this prosperity would have descended to the laborers, and we should look for neat and roomy cottages, with ample gardens, so essential to the well-being of the poor."

Instead, Mr. Wallace reports that, in spite of some recent improvements,

"pauperism, tho' not so prevalent as in the depopulated Highlands, still abounds even in the fertile and highly farmed Lowlands, where about 1 in 40 of the population are returned as paupers or dependents. . . . It appears, then, that both in the barren Highlands and the fertile Lowlands, among the peaceable and contented Celts, as well as among the more restless and energetic Saxons, we find the same increase in the wealth and luxury of the landlord and the capitalist, accompanied by the misery, discontent, and chronic pauperism of the laboring classes. In both districts landlordism has had its own way, and has flourished; in both it carries in its train the physical, social, and moral degradation of those by whom its wealth is created. It is not that landlords are worse than other men; perhaps it may justly be said that they are somewhat better than the average; but no amount of good intentions or good administration will suffice when the system which is administered is fundamentally wrong. No system ever had a fairer trial than pure landlordism has had in Scotland during the present century. It has had the freest liberty of action under various conditions, a peaceful, honest, and contented body of laborers, a constantly increasing growth of wealth, and all the means and appliances of modern science at its command. Yet here, as always and everywhere, it has lamentably failed to produce either prosperity or contentment."

Such is a brief review from unimpeachable sources of landlordism in Great Britain, where nineteen twentieths of the people have scarcely any land, and one twentieth have houses and lands valued at \$1,150,000,000 (see below). To

be more exact, in England only 1 person in 20 is an owner of land; in Scotland, 1 in 25; in Ireland, 1 in 79; and the great majority of landholders in Great Britain own less than one acre each. One man rides in a straight line 100 miles on his own estate. Another owns a county extending across Scotland. A gentleman in Scotland a few years since appropriated 300 square miles of land, extending from sea to sea, to form a deer forest, evicting many families to make room for the deer.

FRANCE.

In France, land is very much more subdivided than in England.

According to *La Grande Encyclopédie*, vol. xvii., p. 1006, the number of land holdings in 1891 was about 14,000,000, owned by about 8,000,000 persons, of which about 5,000,000 own agricultural holdings.

According to Mulhall (*Dictionary of Statistics*), the official summary of 1885 gave 50,500,000 acres as tilled by owners; 22,800,000 acres as tilled by tenants; 11,100,100 acres as tilled by *metayers*.

The small holdings are mainly in the departments of the Seine, the Rhone, Belfort, the North, Puy-de-Dôme, Haute-Garonne, Gard.

For a discussion, however, of how far small peasant holdings under modern conditions of taxation, etc., are advantageous, see below, Sec. 4.

The wretched condition of the French poor as late as the eighteenth century, their inhuman treatment by absentee landlords, who had ceased to give feudal protection, but extorted more than feudal service, is graphically described in M. Taine's *Ancien Régime*. These oppressions, however, had not been suffered tamely. The terrible insurrection of the *Jacquerie* in 1358 was an uprising of the peasants. Their fierceness gave the powerful an excuse for keeping them deprived of rights, and brought them to look on their dependents as little more than beasts of burden, valuable only for the profit that might be made of them. The feeling engendered on the other side broke out in the Revolution. The country estates, from which the *émigrés* had fled, were sold in portions, and in many cases bought in fee simple for a trifle by the former tenants of the farms. The law of equal division among children continued the process of subdivision. It proceeds in an augmenting ratio, and few large properties still subsist. The land, however, held in small properties, is not universally cultivated by the owner. There is a large proportion of tenants, holding generally under leases not exceeding nine years; and there is no doubt that the shortness of the term impairs production. Another evil is the *mercellement* caused by the law of compulsory division on inheritance, objected to in France chiefly on the ground that through successive family divisions each man's total property consists of a number of small plots scattered up and down. Nor must it be forgotten that this peasant proprietorship still leaves millions in cities, towns, and villages without any land.

GERMANY.

In different parts of Germany very different forms of tenure exist. Altho feudalism was fully developed, here too, as a legal system and as the foundation of the aristocracy, it did not succeed in extirpating entirely the ancient rights of the people. A large portion of the land was held always as peasant properties, entirely free from any dues of service. Among these, in certain districts, there survived an organization essentially identical with that described by Tacitus. The village had its domain or mark (*g. v.*), subdivided into the arable, the pasture, and the forest. In some cases the first of these was partitioned into individual and permanent properties, but in all the pasture and forest remained the joint property of the village. Instances, however, were not wanting where the arable portion was subject to annual or less frequent repartition, and to apportionment by lot to each cultivator for the time which custom ordained.

But more common was feudalism. None who were not noble could as a rule purchase land. On the lands of the nobles the tenants were bound to give to their lord a portion of their time in gratuitous labor. They held, however, their farms under conditions of permanency, subject to this tax of labor, and to a variety of small and irregular exactions of the nature of rent.

These conditions endured to the beginning of this century. Stein's edict of 1807 abolished serfdom and obliterated the legal distinction of classes by establishing freedom of exchange in land and free choice of occupation. In 1810, Hardenberg, with a precipitancy which Stein would scarcely have approved, continued the reform in the condition of the peasants by making them absolute owners of part of their holdings, the landlords obtaining the rest as an indemnity for their lost dues.

These reforms have converted large parts of Germany into the property of small owners residing on and tilling their own land, free from obligation to any other person. (For details of German tenure, as applied in agriculture, see AGRICULTURE.)

According to the returns for 1887, 2,953,000 acres were tilled by their owners; 829,000 acres were tilled by tenants; 1,494,000 acres were tilled under mixed forms of partial ownership.

OTHER EUROPEAN COUNTRIES.

Switzerland is, in the main, a country of small holdings. By far the larger proportion of the land is held in small farms of from two to five hectares. In a few of the cantons considerable land, tho mainly on the mountains, is still held in common as *allmends*. (See SWITZERLAND.) In Italy, the *metayer* system prevails. (See METAYER; AGRICULTURE, section "Italy.") In Austria, small holdings prevail in most of the empire; but in Bohemia, large manorial landed estates are still found. All through the empire, however, the peasant proprietaries seem to be disappearing. (See AGRICULTURE, section "Austria.") Belgium is preeminently a land of small holdings. With an area less than one fifth that of England and Wales, she has over 1,000,000 owners of land.

The cultivated land of Belgium amounts to 2,663,753 hectares, or 6,582,123 acres, of which 1,339,795 hectares are in the hands of the proprietors, and 1,323,958 are let to tenants. The land is divided into nearly 600,000 patches. Of these, 43 per cent. do not exceed 50 acres; there are 12 per cent. not exceeding 1 hectare, or 2½ acres; 29 per cent. not exceeding 5 hectares; 7½ per cent. not exceeding 10 hectares; and less than 8 per cent. of greater extent.

Holland, Denmark, Norway, and Sweden all have small holdings. Russia, by the abolition of serfdom, nominally gave land to all her people, but gave the peasants each so little that it was impossible to live, and they have been compelled to sell them to the nobility, and often to flee to the cities to compete for trade, producing the greatest want, suffering, and misery. (See RUSSIA.)

AUSTRALASIA.

For Australasia we give the most recent conditions. Says the English *Labor Annual* for 1896:

"The population of the Australasian colonies is not yet 5,000,000; nevertheless, one finds to-day in Australasia—a land capable of supporting in ease and comfort at least 100,000,000 of people—the same industrial depression, the same unemployed problem, and the same poverty among the masses that are in the Old World attributed to over-population. The cause of this, however, is not far to seek. In New South Wales, for instance, the official returns show that some 600 individuals 'own' more than half of the land alienated from the crown; in South Australia it is estimated that 703 persons 'own' half the land values of the colony; in New Zealand, out of the 10,000,000 acres alienated from the crown, upward of 17,000,000 acres are controlled by 1600 persons only, four of whom 'own' 600,000 acres between them, while 17,000 families, numbering about 80,000 souls, have to grub along as best they may on a paltry 300,000 acres. In the other colonies the position is much the same. With a view to improving this state of affairs, Sir George Grey introduced in New Zealand, in 1878, a tax on land values of ½*d.* in the pound. At the ensuing election, however, Major Atkinson became Premier, and the tax was abolished. But the principle has since made great strides. In South Australia a tax of ¼*d.* in the pound has for some nine years past been imposed on land values, and in 1893 a bill passed both houses of the Legislature empowering local bodies to rate the unimproved value of the land; but a bill passed in 1894 by the Lower House, increasing the tax on land values, and graduating it heavily against absentees, was rejected by the Upper House. In New Zealand a tax of 1*d.* in the pound, steeply graduated against large estates, was imposed in 1892; but a bill to empower local bodies to rate land values was passed by the Lower House in 1893, only to be rejected by the 'Lords.' The bill was again passed by the Lower House last year, but was thrown out by the Non-Representative Chamber by 14 votes to 12.* The Tasmanian House of Representatives also passed in 1893 a bill taxing land values up to £500 at ¼*d.* in the pound, and over that amount at 1*d.* in the pound, but the 'Lords' threw it out. A similar bill was again introduced in the Tasmanian House of Representatives on August 16 last, but it was again rejected by the 'Lords.' In Victoria, again, the Lower House passed, in 1894, a land tax bill on the New Zealand model, but the Upper House rejected it. In Queensland, in 1893, a bill was passed by both Houses adopting the land-value system of taxation for municipalities, and fixing the amount of the tax at 2*d.* in the pound. This has been found ample for all local requirements; there is now no local taxation on improvements in Queensland, and in the country districts the tax has been found to considerably lighten the burdens of the users of land. In May last the New South Wales House of Representatives passed a Land

and Income Tax Bill on the New Zealand model by a two-to-one majority, but the Upper House rejected it. The Premier at once appealed to the country, and his policy being vindicated at the polls, the bill was again passed by the Lower House on September 17 by 54 votes to 24."

Of some Australian farms or stations a newspaper correspondent writes:

"One James Tyson has about 2,000,000 acres, or a territory nearly as large as three States like Rhode Island, one and one-half Delawares, or even one third the size of Vermont, or one seventeenth the size of Iowa. He has nearly 1,000,000 sheep or the equivalent in cattle. One Mr. McCaughey has one station of 1,214,877 acres, with some 500,000 sheep. James Wilson has 640,000 acres, or just 1000 square miles, in one station, and over 400,000 sheep. I have a friend in the interior, whom I visited recently, who has 800,000 acres and 300,000 sheep. One can drive 100 miles on a straight line on his estate. Of this 500,000 acres, 70,000 are in hold, and the rest is leased from the Government of New South Wales on long time, for a definite annual rental. I have another friend, a member of the New South Wales Parliament, who holds 240,000 acres in Queensland on long lease, at an annual rental of one farthing, or one half cent per acre."

THE UNITED STATES.

The United States would seem to be the last country in the world to look for land monopolization. A country comparatively new, with a domain stretching across a continent, capable of sustaining a population vastly larger than it does (see FOOD SUPPLY), with laws carefully framed to aid the settler in gaining a home (see HOMESTEAD LAW), one would not look for land monopoly in such a country. What are the facts? According to the Census of 1890, only 65.92 per cent. of the families occupying farms owned their farms, and of these 28.22 per cent. owned their farms subject to a mortgage, leaving only 47 per cent. of the farm families of the United States owning their farms without incumbrance. In the cities a greater monopoly of land exists. From 1880–90 the value of farms increased only a little over \$2,000,000, or about 20 per cent.; but the value of residence and business real estate increased over \$14,000,000, or more than 100 per cent. Yet this enormous value is in few hands. In Boston, 57 per cent. of the population do not own the houses they live in; in New York City, 80 per cent. live in tenements. Taking all the country through, in town and city, on farm and in village, only 35 per cent. of the families of the land own an unincumbered home. Not every mortgage, it is true, indicates financial distress. People often mortgage lands and houses in order to make future gain; but if every single mortgage was paid off, still only 48 per cent. of the families of the United States would own their homes, while it is notorious that hundreds of thousands of mortgages are foreclosed. Farm after farm in the West is passing into the hands of Eastern investors or land syndicates. Millionaires are buying extensive country seats and stretches of territory in all the most beautiful sections of the country. Railroads own an ever-increasing proportion of our mines and other natural opportunities. Many new small farms were opened up between 1880 and 1890, yet farms of between 50 and 100 acres increased only 8.58 per cent., while farms of from 500 to 1000 acres increased 11.09 per cent., and farms over 1000 acres increased 10.39 per cent. The

* The bill was once more passed (on October 3, 1895) by the Lower House by 41 votes to 7. The "Lords" will hardly dare again to throw it out.

land of the country is steadily passing from the ownership of the people. For further information on this see the next section.

III. THE RESULTS OF LAND OWNERSHIP.

We have seen that in Great Britain only one man in a hundred owns more than an acre; that in the United States scarcely one family in three owns a home; that if in Russia, and to a less extent elsewhere in Continental Europe, peasant proprietorship largely prevails, the peasants each own so little land as scarcely to be able to live on it, while millions crowd into the great cities. What does this mean? To realize the meaning, one must first remember what land means to man.

Man is "a land animal." He cannot produce; he cannot propagate his kind; he cannot live without land. This is, of course, patent to all. Yet it is frequently forgotten in economic discussions. Men interest themselves in this and that so-called "practical question," and overlook the fundamental fact and necessity of human life. Yet no man ever denied or can deny the absolute necessity of land to human life. John Stuart Mill begins his *Principles of Political Economy* with the words: "The requisites of production are two, labor and appropriate natural objects"—i.e., land. Says Cardinal Manning:

"The land question means hunger, thirst, nakedness, notice to quit, labor spent in vain, the toil of years seized upon, the breaking up of homes, the misery, sicknesses, death of parents, children, wives, the despair and wildness which spring up in the hearts of the poor when legal force, like a sharp harrow, goes over the most sensitive and vital right of mankind. All this is contained in the land question."

The only possible misunderstanding on this point can come from a failure to realize what is meant in economic discussion by the word *land*.

It means not only the earth surface of the world; it means the surface of the whole world, earth and water, all that is in the earth and in the water except man and the

labor of man. Says Jevons (*Political Economy Primer*, p. 26): "When we speak of land we really mean any source of materials, any natural agent." Economists thus use the word *land* because among all natural agents land is so far the most important that it can be used to represent all the rest. Air is equally necessary to life, but under ordinary circumstances air cannot be appropriated, and hence has no exchange or commercial value. Under those few circumstances, as in a crowded city, where air cannot be freely obtained, it has a commercial value, but it for the most part goes with the land, and may be economically considered as a part of land. Remembering, then, what is meant by land, there can be no question of the fundamental importance of land to human life, and what results must be involved in its monopolization. But before we analyze this, notice one other point. We stand to-day on the land question at a crisis in the world's history. For the first time in the history of the world all the land in the northern temperate, and, indeed, almost all in the lower temperate zone, has been appropriated. Now the northern temperate zone has been thus far the only zone which has produced

the great controlling civilizations of the world. Down to the present time any persons or companies of persons desiring more land could move somewhere in the north temperate zone and find good land wholly or very nearly wholly unappropriated. From the fields and vales of Asia, early in the history of the world, gigantic nomadic tribes and hordes poured westward, to find new grazing fields in Eastern Europe; later they overran Europe, founding the Greek and Roman civilizations, the early Celtic races. Still later, in the migration of the Goths were planted the civilizations we know to-day. When this migration was substantially completed, Columbus discovered a new world, and Europe overflowed to the Atlantic coast of the American continent. Since then civilization has spread across the continent, till at last, in our day, population has reached the Pacific coast, filled all spaces, and completed the belt of the world. By irrigation and other processes some land now worthless may be reclaimed; here and there small tracts of land may yet be had almost for the asking; population in many sections is scarce; but, roughly speaking, all the land is appropriated; the United States public domain nearly all sold; the best land all occupied. What is left is either inferior soil or to be made useful only at unusual cost. The significance of this condition in the world's history cannot be overestimated.

Let us, then, now examine some of the chief results of land monopolization. Among the first results must be the dependence in all civilized countries of those who have not land upon those who have. If, as we have seen, land is necessary to production and to life, the masses in all countries must be dependent on those who own the soil. Alike under the Czar and in "free" America, plutocracy reigns and must reign, while the people are dependent on the few for the first necessities of existence. Says an old Saxon proverb: "The landless man is an unfree man." Mr. George has abundantly shown this. He says (*Social Problems*, chap. xv.):

"That a people can be enslaved just as effectually by making property of their lands as by making property of their bodies is a truth that conquerors in all ages have recognized, and that as society developed the strong and unscrupulous who desired to live off the labor of others have been prompt to see. The coarser form of slavery, in which each particular slave is the property of a particular owner, is only fitted for a rude state of society, and with social development entails more and more care, trouble, and expense upon the owner. But by making property of the land instead of the person, much care, supervision, and expense are saved the proprietors; and the no particular slave is owned by a particular master, yet the one class still appropriates the labor of the other class as before. . . .

Slavery.

"We have abolished negro slavery in the United States. But how small is the real benefit to the slave! George M. Jackson writes me from St. Louis under date of August 15, 1883:

"During the war I served in a Kentucky regiment in the Federal army. When the war broke out my father owned 60 slaves. I had not been back to my old Kentucky home for years until a short time ago, when I was met by one of my father's old negroes, who said to me: 'Mas' George, you say you sot us free; but 'fore God, I'm wus off than when I belonged to your father.' The planters, on the other hand, are contented with the change. They say: 'How foolish it was in us to go to war for slavery! We get labor cheaper now than when we owned the slaves.' How do they get it cheaper? Why, in the shape of rents they take more of the labor of the negro than they

could under slavery, for then they were compelled to return him sufficient food, clothing, and medical attendance to keep him well, and were compelled by conscience and public opinion, as well as by law, to keep him when he could no longer work. Now their interest and responsibility cease when they have got all the work out of him they can."

But what comes of this land slavery? First the horrors of the overcrowded city. Unable to obtain land in the country on which they can get a living, the landless, or the peasants, as in Russia, from allotments too small to support life, crowd into the great cities and produce the slums. What that means is well known. (See SLUMS.) But it has its effects on the country also. Says Mr. George (*idem*, chap. xxi.):

"As the cities grow, unwholesomely crowding people together till they are packed in tiers, family above family, so are they unwholesomely separated in the country. The tendency, everywhere that this process of urban concentration is going on, is to make the life of the country poor and hard, and to rob it of the social stimulus and social gratifications that are so necessary to human beings. The old healthy social life of village and town-land is everywhere disappearing. In England, Scotland, and Ireland, the thinning out of population in the agricultural districts is as marked as is its concentration in cities and large towns. In Ireland, as you ride along the roads, your car-driver, if he be an old man, will point out to you spot after spot which, when he was a boy, were the sites of populous hamlets, echoing in the summer evenings with the laughter of children and the joyous sports of young people; but now utterly desolate, showing, as the only evidences of human occupation, the isolated cabins of miserable herds. In Scotland, where in such cities as Glasgow human beings are so crowded together that two thirds of the families live in a single room, where if you go through the streets of a Saturday night you will think, if you have ever seen the Terra del Fuegians, that these poor creatures might envy them; there are wide tracts once populous now given up to cattle, to grouse, and to deer—glens that once sent out their thousand fighting men now tenanted by a couple of gamekeepers. So across the Tweed, while London, Liverpool, Leeds, Manchester, and Nottingham have grown, the village life of 'merrie England' is all but extinct. . . .

Poverty.

"So in the agricultural districts of our older States the same tendency may be beheld; but it is in the newer States that its fullest expression is to be found—in ranches measured by square miles, where half savage cowboys, whose social life is confined to the excitement of the 'round up' or a periodical 'drunk' in a railroad town are the only diversions; and in bonanza farms, where in the spring the eye wearsies of seas of waving grain before resting on a single home—farms where the cultivators are lodged in barracks, and only the superintendent enjoys the luxury of a wife."

But out of this condition spring not only the horrors of the slums, but low wages for all wage workers. The wage of the man at work is lowered by the competition of the man out of work. If the worker complain of low wages, there are two men waiting for his job. The boy comes up from the mortgaged farm to try and earn money in the city to stave off foreclosure for his parents; his competition—for he is desperate, and will work "cheap"—drives some city workman out of work and so out of a home. Skilled workmen have some security of occupation, but invention and machinery often enable the unskilled from the country to take even their places. Trade-unions force up and keep up wages for a few; but a crisis comes, and in the majority of trades the workman, having no land to live on to tide himself over a hard day, is unable to keep up his dues, and the trade-union is broken up. In the majority of

trades, organization is all but impossible because of the unemployed, who will and must compete at any price. In the United States organized labor includes only 7 per cent. of the persons in the United States engaged in gainful occupations. The main occasion of competition is the lack of opportunity upon the soil.

But the monopolization of land produces not only the extremely poor but the extremely rich. Men acquire a little money by work; but the great fortunes are made by investment, and often by speculation. The great sphere for investment and speculation is land. Men invest in Western mortgages, in mines, above all in city and sub-urban real estate. They do nothing, but their money grows. The result is *unearned increment*. Land in cities is valuable simply because it is in the midst of population. A store in New York City is worth more than a store in the country, because it has more purchasers; more people pass its windows. As the city grows in size the land rises in value. The owner of the land does nothing. He may sleep, live in luxury, gamble, idle, be an angel or a voluptuary; it matters not what he is or what he does; so long as he is a land-owner his land may rise in value. Such rise in rent is *unearned increment*. It is produced, not by him, but by the community which gives the land its value. Land to-day in portions of New York City has been sold at \$331 per square foot. (See *Real Estate Record and Guide* for September 14, 1895.) In 1890, the whole real estate of the city of New York was valued at \$2,627,000,000. In 1624 the Dutch purchased Manhattan Island for \$24. On the present site of Chicago in 1816 there was not a white person, and the land was practically valueless; the Census of 1890 estimates the real estate value of the city at \$1,330,000,000.

The Unearned Increment.

"The Illinois Labor Bureau in 1895 (*Eighth Annual Report*, pp. 104-253) made a careful investigation of land values in the city of Chicago. The most valuable section is known as the 'South Side,' and its boundaries are the Chicago River on the north and west, Twelfth Street on the south, and Lake Michigan on the east. Exclusive of streets it contains 351.42 acres. All the great stores, wholesale and retail, the high office buildings, and the great banking institutions are found within this area. Deducting 30 acres of public land owned by the nation, State, county, and cities, and 55.13 acres owned and used by the railroads, there remain 266.29 acres belonging to individuals and private corporations. This the bureau estimates to be worth \$310,000,000 for the land alone, without reckoning the improvements, worth as much more. Of this the largest holder, Marshall Field, owns \$11,000,000, and the next largest holder, Levi Z. Leiter, \$10,500,000. There are in all 1178 owners of this 310,000,000, of whom 18, or 1½ per cent., own 65,000,000, or over 20 per cent. of the total. Eighty-eight persons own 136,000,000, which is nearly one half of the business center of the city of Chicago (*Report*, p. 247).

"According to this same report (p. 370), one quarter acre in Chicago in 1830 was worth \$20; in 1840, \$1500; in 1850, \$17,500; in 1860, \$28,000; in 1870, \$120,000; in 1880, \$130,000; in 1890, \$900,000; in 1894, \$1,250,000."

It is by such leaps that those who bought land 50, 30, 20, even 10 years ago, have made fortunes without doing themselves any economically productive work. Nor does this process go on only in the great cities. Said Mr. Mulhall, in the *North American Review* for June, 1895:

"If we would classify the whole wealth of the Union

under two heads, urban and rural, the result at different dates would be as follows :

URBAN AND RURAL WEALTH OF THE NATION.

YEARS.	MILLIONS OF DOLLARS.			PERCENTAGE OF TOTAL.	
	Urban.	Rural.	Total.	Urban.	Rural.
1850.....	3,169	3,967	7,136	44.4	55.6
1860.....	8,180	7,980	16,160	50.6	49.4
1870.....	15,155	8,900	24,055	63.0	37.0
1880.....	31,538	12,104	43,642	72.2	27.8
1890.....	49,055	15,982	65,037	75.4	24.6

"In the above table rural wealth is the aggregate of the value of lands, cattle, and implements at each census; the rest is urban. We find that rural or agricultural wealth has only quadrupled in 40 years, while urban has multiplied sixteenfold."

In London (*q. v.*) the ground rent is \$75,000,000, and is increasing at the rate of over \$1,500,000 annually. The "gross annual value" of real estate of all kinds in the United Kingdom, ten elevenths of it being owned by one two hundredths part of the people, is \$1,150,000,000. (For authorities for these statements, see WEALTH.) Land is the basis of the plutocracy of the world.

Present conditions as to land, too, are the potent cause of innumerable moral ills. People are shocked to-day at the growing tide of prostitution, social immorality, licentiousness among the wealthy, lax-

Moral Evils. ity among the poor. When the poor cannot get work, when they are crowded into rotting tenements,

where privacy is impossible, where modesty can scarcely be, where children are compelled to grow up amid ribaldry and drunkenness, prostitution, the sale of girls for money, is all but inevitable. It becomes still more inevitable when thousands of idle young men from the luxurious classes set the example of profligacy to still more thousands of young men of the lower and middle classes. Take thousands of underpaid, underfed young women, and throw them in stores, on the street, and in type-writing offices, with thousands of overpaid, overfed young men, and there can be only one result. Let the Christian Church be identified, too, in the public mind with the luxurious classes; let there be a divorce between the teachings of Christ and the lives of prominent church people, and the masses of intelligent young men and women will grow skeptical of moral living, which is a thousand times worse than skepticism of God; gross immorality must result. Temperance workers speak of the evil of the saloon; but facts are proving (see POVERTY) that at least a large part of intemperance is due to the voluptuous idleness of the rich and the terrible environment of the poor. The relation of the land problem to intemperance can scarcely be conceived too close. Other moral evils arise. The opportunities to make wealth by land investment develop the love of speculation, and in unexpected circles, even among women. Honest labor becomes despised. Life in the great cities becomes among the poor a desperate scramble for existence; among the wealthy a

debasing struggle to grow more wealthy without work.

From these moral evils result political evils. When the many are poor and the few are rich; when the corporations need votes and the professional politicians need money, political purity becomes scarce. The greatest steals, too, from the national Government have been land steals on the part of railroads through land grants on conditions never fulfilled; land steals on the part of great syndicates under the cover of Homestead Laws. Great estates and great fortunes are slaying democracy in America. (See PLUTOCRACY.) Such are some of the results of the present conditions of land monopoly among all civilized peoples.

IV. HOW FAR REFORM CAN BE REACHED WITHOUT RADICAL CHANGES IN LAND TENURE.

Among those who look for reform in the land question without radical changes in the forms of land ownership, there are two main views. One view would seek reform by increasing the number who own small land holdings. The classic argument for this view is John Stuart Mill's. In his *Principles of Political Economy* he devotes many pages to collecting testimony to show the advantages of peasant proprietorship. Among many other workers, he quotes Sismondi as saying (*Studies in Political Economy*, Essay III.):

Small Holdings.

"Wherever we find peasant proprietors, we also find the comfort, security, confidence in the future, and independence, which assure at once happiness and virtue. The peasant who with his children does all the work of his little inheritance, who pays no rent to any one above him, nor wages to any one below, who regulates his production by his consumption, who eats his own corn, drinks his own wine, is clothed in his own hemp and wool, cares little for the prices of the market; for he has little to sell and little to buy, and is never ruined by revulsions of trade. . . . The peasant proprietor is of all cultivators the one who gets most from the soil, for he is the one who thinks most of the future, and who has been most instructed by experience. He is also the one who employs the human powers to most advantage, because dividing his occupations among all the members of his family, he reserves some for every day of the year, so that nobody is ever out of work. Of all cultivators he is the happiest, and at the same time the land nowhere occupies, and feeds amply without becoming exhausted, so many inhabitants as where they are proprietors. Finally, of all cultivators the peasant proprietor is the one who gives most encouragement to commerce and manufactures, because he is the richest."

Arthur Young is quoted as saying (*Travels in France, 1787-89*, vol. i., p. 88, and vol. ii., p. 51):

"M. le Brun has an improvement on the Dunes, which he very obligingly showed me. Between the town and that place is a great number of neat little houses, built each with its garden, and one or two fields enclosed, of most wretched blowing *dune* sand, naturally as white as snow, but improved by industry. The magic of *property* turns sand to gold.' And again: 'Going out of Grange, I was surprised to find by far the greatest exertion in irrigation which I had yet seen in France; and then passed by some steep mountains, highly cultivated in terraces. Much watering at St. Lawrence. The scenery very interesting to a farmer. From Grange to the mountain of rough ground which I crossed the ride has been the most interesting which I have taken in France; the efforts of industry the most vigorous; the animation the most lively. An activity has been here that has swept away all difficulties before it, and has clothed the very rocks with verdure. It would be a disgrace to common sense to

ask the cause: the enjoyment of property *must* have done it. Give a man the secure possession of a bleak rock, and he will turn it into a garden; give him a nine years' lease of a garden, and he will convert it into a desert."

Considerations such as these have induced many European economists, except perhaps in England, to believe that in peasant proprietorship or the owning of the land in small holdings lies the solution of the land question.

Professor Marshall, whom some consider the leading living English-speaking economist of the world, says (*Economics of Industry*, Book I., chap. ix.):

"The desire for the ownership of land as an end in itself is still strong everywhere, and is gaining a new force among the English working classes. It is to be hoped that ere long there may be a great increase in the number of those who own small plots which they may cultivate with their spade, or on which they may feed a cow or a horse. A movement is being made with the purpose of grouping together a number of small holdings, so that they may share the use of expensive machinery. . . . It is to be hoped that a speedy reform of the law, aided by a good land register, will promote the formation of small properties. In a few cases it may perhaps lead to their extinction, but it will probably largely increase their number where they are most wanted."

Those who would meet the land problem in this way look for reform to the abolition of all laws or customs, as in England, of entail, or any expedient for keeping large estates in one family. They seek laws facilitating land transfer (*q.v.*); they hope for cooperative agriculture (*q.v.*). In the cities and industrial communities their main reliance is building associations (*q.v.*), enabling the workman to buy a home.

The objections to this view are very great. No one who knows the present condition of the peasant proprietors in continental Europe believes them much if any more prosperous than the agricultural classes of England under a system of landlordism. In Russia, the peasant proprietors cannot live. So much is this the case that the majority of English economists have preferred the system of the ownership of the soil in large properties and the renting of it to tenants, protected, however, by laws of tenant-right, etc. The small owner cannot apply capital to land. Small farming is uneconomic farming. If this was so in the past, it is particularly so to-day. Even Marshall says (*Economics of Industry*, Book I., chap. ix.):

"Recent events (1885) have again increased the difficulties against which peasant proprietors have had to contend. Great importations of grain and meat from new countries have lowered prices, but the burden of the fall has been borne in England chiefly by the landlords and farmers. The laborers have on the average at least as much of the necessities, comforts and luxuries of life as at any previous time; and this in spite of the fact that many of the ablest and strongest of them have migrated to the towns or to new countries. But the peasant proprietors, particularly of arable land, have nothing to shield them from the full effects of the fall in prices. Many of them have lost nearly all their little margin of savings, and not a few are in debt. Even those who are in outward appearance prosperous frequently work harder and live more sparsely than the English laborers."

Mr. D. A. Wells says (*Recent Economic Changes*, p. 461) "that the only possible future for agriculture, prosecuted for the sake of producing the great staples of food, is to be found in large farms, worked with ample capital, especially in the form of machinery, and with labor organized somewhat after the factory system, it is coming to be the opinion of many of the best authorities, both in the United States and Europe."

Mr. Wells adds in a note:

"An American practical farmer, the owner and manager of 7000 acres (Mr. H. H—, of Nebraska), to whom the writer is indebted for many items of information, communicates the following additional review of this subject from the American (Western) standpoint: 'The average Western farm is now recklessly managed, but capital will come in greater volume and set up processes which will displace these wasteful methods. The revolution is certain, even if the exact steps cannot now be precisely indicated.'"

The day of the small farmer under the present industrial system seems over. He cannot compete with bonanza farms tilled and worked with expensive machinery, well stocked, etc. Under the present system of land ownership the future means large farms owned by capitalists, with the mass of the people as their tenants. This is the ideal of the second class of those who look for reform without radical change. They say, let the world copy England. Let there be large estates owned by rich capitalists, perhaps by syndicates; let them be worked by tenants, protected by the law, well paid, and prosperous.

Large Holdings.

But this view will not endure. For better or for worse, democracy has the future. Even in England to-day, where this system has been carried farthest, where the landed aristocracy furnishes undoubtedly the best landlords of the world—even in England, step by step, democracy is replacing the landlord's power. Above all, as we shall in a moment see, is the sense of justice demanding to-day that the land be for all, and not be monopolized by the few. We come, therefore, to consider

V. RADICAL PROPOSALS FOR LAND REFORM.

These proposals are of several kinds. Undoubtedly most distinctively land reformers advocate the plan of the *single tax*, first prominently advocated in Mr. Henry George's *Progress and Poverty*. For a full consideration of this proposition, see **The Single Tax.** SINGLE TAX; we simply outline it here. It proposes that an annual tax should be put on all land equal to the full rental value of the land *apart from improvements*. This would leave in the landowner's hand, untaxed, all the improvements or labor he has put on the land, but tax away from him into the hands of the State for the equitable good of the community all natural land value. No titles need be changed in this way; no labor would be discouraged; the results of no labor would be taken, but the value of the land itself, which no individual has created, and which equity demands should belong to all, would be taken for all. Especially in cities, where enormous values have been created by the presence of the community, would the value of the land be taken for the community which created it. The results of this plan would be to kill landlordism without discouraging honest labor. This would be the case because land, being taxed its full rental value, only those would hold land who got something out of it more than its rental value, and this could only be done by putting value into it. The landlord would be taxed out of existence; those who by useful labor put

value into the land could alone be its owners. And this would practically include all who desired land, because it has been proven over and over again that were it not for the large estates of landlords, there is plenty of land for all. In crowded England, for example, there are, according to Hoyle's *Sources of Wealth*, 50,000,000 acres of good land, and her population in 1891 was 27,483,490—equal to some 7,000,000 families. This could give every single family seven acres if they wished. But millions of families would not use seven acres. They would prefer to pay, perhaps, for not more than one half an acre, and make their living, not by tilling the soil, but by art, manufacturing, commerce, etc. There would thus be abundant land for all who wanted, if no one could afford to hold more land than he actually used. The tax would kill the rent value of land.

Nor would it need a sudden revolution to bring in the system. It is one of the best features of the system, that it could be brought in gradually by simply raising the rate of land taxes every few years, till finally they equal the whole rental value. This process is now actually going on in Australasia.

Nor would the system bring hardship on small farmers and the holders of small lots, because it would bring so much money into the State that there would need to be no other tax; it would be a *single tax*. It would abolish all the direct and indirect taxes which to-day press upon the consumers of the land. In free-trade countries it would make unnecessary all other direct taxes, and in protective countries it would do away with all those protective tariffs which raise the price of all the commodities the poor have to buy. (For a full discussion of this, see *SINGLE TAX*.)

Nor would it, too, necessitate the socialistic expansion of the State. Placing one tax, and that the easiest to collect, in place of all, and opening up land so that every man could have opportunity to work, it could largely reduce the machinery of the State, giving democratic freedom and opportunity to all.

The supreme argument, however, for the proposition is that it would conform to the strictest justice by placing all on an exact natural equality in all but their own abilities. Those who held the best land would have to pay for it the exact amount of its superiority to other land, because all would pay the whole rental value. Each man would then get exactly according to his ability. Such is the argument.

We come next to consider a proposition akin to this and yet very different—that of the anarchists, or extreme individualists, who would do away with all government and all taxation, establishing a so-called system of "free land," or land to belong to those who can use it and defend it, either by personal defense or by cooperating to defend each other's land. (For a discussion of this, see *ANARCHISM*.)

At the opposite extremes from this lie the various proposals of communists, nationalists, socialists, land nationalizers, who would vest all title in the community and have the land owned and operated by cooperative commonwealths. This would mean, of course, socialism, with all that that entails. It is utterly different from

the proposition of the single tax. The single tax would diminish the sphere of the State; socialism would exalt the State. (For a discussion of this, however, see *SOCIALISM*.) We here only state the various propositions, leaving them to be discussed under their various heads. **Other Propositions.**

We now notice the arguments raised against these various radical reforms on behalf of the private ownership of the soil.

The argument for private ownership of the land may be divided into two: the argument from expediency and the argument from justice. Most economists to-day argue from expediency. They maintain that the argument from justice is so uncertain and the theory of natural rights so open to debate that it can settle nothing. One man declares this to be just, another that; the argument from expediency they consider the only one we can appeal to; and this the opponents of land nationalization, or of the single tax, declare to be strongly in favor of the private ownership of land. **Arguments for Private Ownership.**

The argument from expediency they consider the only one we can appeal to; and this the opponents of land nationalization, or of the single tax, declare to be strongly in favor of the private ownership of land. John Stuart Mill, who later converted to a theory of land nationalization coupled with a scheme for compensating landlords, and still later (see *MILL*) converted to the belief that the single tax was the best way in which to realize the equal right in the value of his soil, in his earlier works made a strong plea from expediency for individual ownership of the soil. He showed (see above) what peasant proprietorship and small holdings of the soil had done. Of the question whether the results justify private ownership, he says (*Dissertations and Discussions*, vol. v.):

"The general verdict of civilized nations has hitherto been that this justification does exist. The private appropriation of land has been deemed to be beneficial to those who do not, as well as to those who do, obtain a share. And in what manner beneficial? Let us take particular note of this beneficial, because the strongest interest which the community and the human race have in the land is that it should yield the largest amount of food, and other necessary or useful things, required by the community. Now, tho the land itself is not the work of human beings, its produce is; and to obtain enough of that produce, somebody must exert much labor; and in order that this labor may be supported, must expend a considerable amount of the savings of previous labor. Now we have been taught by experience that the great majority of mankind will work much harder and make much greater pecuniary sacrifices for themselves and their immediate descendants than for the public. In order, therefore, to give the greatest encouragement to production, it has been thought right that individuals should have an exclusive property in land, so that they may have the most possible to gain by making the land as productive as they can, and may be in no danger of being hindered from doing so by the interference of any one else. This is the reason usually assigned for allowing the land to be private property, and it is the best reason that can be given."

Later economists, arguing from expediency, dwell on the claim that any radical change in land tenures could not safely, if it could justly, be enacted without compensation, and that with compensation the change would be of doubtful worth to the community.

Professor Hadley (*Economics*, 1896, p. 472) may be perhaps quoted as the latest representative of this view. He says:

"The principle that private property must not be

taken without compensation is no mere accidental phrase let fall by courts or constitution makers. It is an axiom of political science. If the progress of society renders the abolition of an institution necessary, compensation follows as a matter of course. This is the critical weakness in land nationalization plans, like that with which John Stuart Mill's name was identified. The advocates of this plan proposed that England should buy out the landowners and appropriate the future gain in value. No fault could be found with the equity of this proposal. But as a fiscal measure it was radically defective. Leaving out of account the inevitable losses due to a scheme of quasi-compulsory purchase, the scheme must have ended in disaster, because the lands which it was proposed to buy have fallen in value instead of rising. These arguments do not militate against reforms in taxation, which shall carry us in the general direction indicated by the single tax theory. Wagner, after an investigation of the subject whose thoroughness is worthy of the highest praise whether we can accept his conclusions or not, is inclined to look with favor on public appropriation of future increments in the value of city real estate as distinct from agricultural land. Without going so far as Wagner, most economists would be willing to agree that more taxes should be assessed upon economic rent and less upon improvements."

Professor Sidgwick, writing from the standpoint of "utilitarian individualism," puts substantially the same view in other words when he says (*Elements of Politics*, chap. v.) :

"If it is granted, as I should grant, that the landless members of the community have a legitimate claim to the compensation for the opportunities of applying labor to land from which they are excluded by its appropriation, then the question as to the manner in which this compensation is to be taken can only be decided, I conceive, by a careful balance of expediencies. On the one hand, it is for the general good that the individual cultivator's energy and enterprise should be encouraged as much as possible, and complete ownership is the most simple and effective way of encouraging it; on the other hand, it seems probable that the prospective increase of value, accruing independently of the owner's energy and enterprise, will not be adequately represented in the sum received for the land, so that the compensation thus directly secured to future generations for the opportunities from which they are excluded is not likely to be adequate. In practically deciding the question we have to take into account considerations that do not fall within the scope of the present discussion, since we cannot but be partly influenced by the moral and intellectual qualities likely to be possessed by the government that, if the system of leases be adopted, would have the delicate task of artificially providing for the lessee that encouragement of industry and thrift which the system of private ownership gives him naturally."

This is the view probably held by most professorial economists to-day. The more popular argument from expediency claims that the whole history of the world shows that civilization, prosperity, and progress have gone with private property in land, and that to subvert this institution would be to revert to barbarism and discourage thrift and industry. This argument is undoubtedly the main popular argument on this side. It is repeated by its supporters over and over again, and in a thousand forms. Mr. J. C. Spence, in a tract on *Property in Land*, published by the Liberty and Property Defense League, says :

"The whole history of agriculture might be claimed as evidence that land held in common by a tribe or a people can never be put to its best uses; that fixity of tenure is essential to improvement, and that no tenure is so perfect as absolute ownership. The fact that manufactures and commerce prosper best where least hampered by State interference indicates that the proper treatment of the land question is the abolition of all artificial restrictions on its absolute ownership."

But the supporters of private property in land do not only argue from expediency, they also

argue from justice. Mr. Herbert Spencer, who, in his *Social Statics*, written in 1851, declared that equity "does not permit property in land," in his *Justice* (1891) says that tho this be true, nevertheless the State, having long allowed the claims of the land-owners, to tax away or to legislate away the value of their lands would be unjust, while to compensate them would cost more than it is worth; and that even if titles to land do ultimately rest on robbery and injustice in the original ownership, the landless to-day cannot be shown to represent those from whom the land was originally taken. Another form of the argument that land nationalization or even the system of the single tax would be unjust is the claim that the value of land to-day, even in the cities, does not come from the mere natural sources or even from the mere growth of the community, but to a very large extent at least from the labor, the industry, the wit and invention of land-owners, and that hence to legislate or tax away land values would rob the land-owners of the results of their labors and their fathers', and hence both be unjust and inexpedient in discouraging industry and progress. In the *Political Science Quarterly* (vol. vi., pp. 625-634) Mr. C. B. Spahr argues that land in New York City is worth *per family* \$4000; in Ohio, \$2000; and in Mississippi, \$400; and that therefore the value of the land cannot be measured merely by the number of people on it, but does depend very largely on the improvement of the land. The pouring of Hungarians and Italians into certain portions of New York City does not raise, but lowers the value of land in that vicinity. Therefore land values come not merely from population or economic rent, but from the use made of the soil, from the activities of the city; to tax land values to the full would therefore tax and discourage those whose energy and improvements have largely, tho it is admitted not wholly, made land valuable to-day. Mr. Edward Atkinson follows the same line of argument (Single Tax discussion before the American Social Association, September 5, 1890) when he says :

"Put two men of different capacity on land of the same quality, and on the same crop one will get a large rent, the other will barely get a subsistence. Deal with two lots of land in the same city; put a good building on one and a poor building on the other; one will yield a large rent, the other no rent at all. It is neither the quality of the land nor the possession of the land which governs the income; it is the labor and capital applied to the land, and, more than all, the mental capacity (*i.e.*, the mental faculty), which is the prime factor in all production. Land itself possesses no value. The price paid for it is paid for the choice of lots.

"Economic rent is a mere hypothesis, based on the supposed action of an economic man, like whom no man ever existed. It is not a working theory, and may be safely disregarded in the consideration of the subject with which we are now attempting to deal."

This argument thus claims that the value of the land of old countries like England, great centers like New York City, rich farming communities like Ohio, depends not primarily on growth of population or fertility of soil, but on what the owners of the soil have done and are doing, so that to take the value would be unjust and unwise. Such are the main arguments against all forms of land nationalization or a single tax.

To this it must be answered, first, that few if any radical land reformers propose to-day to compensate taxed land-owners. They argue

**Arguments
against
Private
Ownership.**

that if it be true that equity does not permit property in land, injustice does not become justice by lapse of time, and that therefore the land-owners have no equity in the land. They ask with Mr. Spencer himself, against his own later views: "How long does it take

for what was originally a wrong to grow into a right?" Land reformers, however, do not propose suddenly to tax or legislate away landed property. They propose to do it gradually and with full warning by gradually raising the tax slightly every few years, so giving present proprietors full warning to prepare for the new conditions. This does away with the whole argument that land nationalization with compensation would not pay. Even the economists quoted above favor increased taxation of land values.

As for the argument from expediency, land reformers quote all the evils we have shown above to prove the inexpediency of private property in land. A single tax would preserve all the good points in the present system and do away only with its wrongs. The real user of the soil, so long as he used it productively, would, under the single tax—and the socialists claim under socialism—have security of tenure. It would give all the spur to honest labor now given by private capital. It is rent only that would be destroyed.

The main argument against private land ownership is its absolute injustice, as declared by Mr. Spencer himself, and by an overwhelming consensus of the deepest thinkers of all ages. Granted that the owners of the soil have contributed to human advance, they have had vastly more opportunity to do so. Put the children of the slums, *from their birth*, under the conditions of the land aristocracy of England, and who will say whether they might not have done at least as much. (See HEREDITY; ENVIRONMENT.) As it is, the poor, the landless, have at least equaled the land class in making the inventions and progress of the world. All that justice asks is equal opportunity for all, and it is absolutely certain that this cannot possibly be where millions are deferred from access to the land. We close this article by quoting the opinions of some thinkers whose weight and honesty of utterance are beyond question:

Herbert Spencer: "Equity does not permit property in land. For if one portion of the earth's surface may justly become the possession of an individual, held for his sole use and benefit, as a thing to which he has an exclusive right, then other portions of its surface may be so held, and our planet must then lapse into private hands. It follows that if the landowners have a valid right to its surface, all who are not landowners have no right at all to its surface" (*Social Statics*).

"Briefly reviewing the argument, we see that the right of each man to the use of the earth, limited only by the like rights of his fellow-men, is immediately deducible from the law of equal freedom. We see that the maintenance of this right necessarily forbids private property in land. On examination, all existing titles to such property turn out to be invalid; those founded on reclamation inclusive. It appears that not even an equal apportionment of the earth among its present inhabitants could generate a legitimate proprietorship. We find that if pushed to its ultimate consequences a claim to exclusive possession of the

soil involves a land-owning despotism. We further find that such a claim is constantly denied by the enactments of our legislature. And we find, lastly, that the theory of the coheirship of all men to the soil is consistent with the highest civilization; and that, however difficult it may be to embody that theory in fact, equity sternly commands it to be done" (*Social Statics*).

"There is reason to suspect that the inhabited area, which cannot be produced by labor, will eventually be distinguished as something which may not be privately possessed" (*Letter to the Times*, November 7, 1886).

Emile de Laveleye (*Primitive Property*): "The general principles of jurists commend the universal custom of primitive nations, which reserved to the tribe the collective ownership of the soil."

Bishop Nulty: "The land of every country is the common property of the people of that country."

Richard Cobden: "I warn ministers, and I warn landowners and the aristocracy of this country, against forcing upon the attention of the middle and industrial classes the subject of taxation. For great as I believe the grievance of the protective system, mighty as I consider the fraud and injustice of the corn laws, I verily believe, if you were to bring forward the history of taxation in this country for the last 150 years, you will find as black a record against the landowners as even in the corn law itself. I warn them against ripping up the subject of taxation. If they want another league at the death of this one, if they want another organization and a motive, then let them force the middle and industrial classes to understand how they have been cheated, robbed, and bamboozled."

Grant Allen (*Contemporary Review*, May, 1886): "Not one solitary square inch of English soil remains unclaimed on which the landless citizen can legally lay his head, without paying tax and toll to somebody; in other words, without giving a part of his own labor, or the product of his labor, to one of the squatting and tabooing class (the landlords), in exchange for their permission (which they can withhold if they choose) merely to go on existing upon the ground which was originally common to all alike, and has been unjustly seized upon (through what particular process matters little) by the ancestors or predecessors of the present monopolists."

Mr. Gladstone (*Speech at West Calder*, November 27, 1879): "Those persons who possess large portions of the earth's space are not altogether in the same position as the possessors of mere personality. Personality does not impose limitations on the action and industry of man and the well-being of the community as possession of land does, and therefore I freely own that compulsory expropriation is a thing which is admissible, and even sound in principle."

(*Speech at Hawarden*, October, 1836): "I fully admit this—I stated it long ago in Midlothian, and I say it now without the slightest doubt—that if the time came when the British nation found that the land should be nationalized, and it would be wise to do it, they have a perfect right to do it."

Thomas Carlyle: "The notion of selling for certain bits of metal the Iliad of Homer, how much more the land of the world Creator, is a ridiculous impossibility."

J. A. Froude: "Under the feudal system the proprietor was the crown, as representing the nation; while the subordinate tenures were held with duties attached to them, and were liable, on non-fulfilment, to forfeiture."

"Land never was private property in that personal sense in which we speak of a thing as our own, with which we may do as we please."

"Land, properly speaking, cannot be owned by any man; it belongs to all the human race."

Frederic Harrison (*Lecture to the Edinburgh Philosophic Institution*, January, 1884): "They must be ready to act on the ancient principle of the English law, that the nation was the ultimate owner of the soil."

Rousseau (*Discours sur l'Origine de l'Inégalité parmi les Hommes*, 1753): "The first man who, having enclosed a plot of ground, took upon himself to say, 'This is mine, and found people silly enough to believe him, was the real founder of civil society. How many crimes, how many wars, how many murders, how much misery and horror, would have been spared the human race if some one, tearing up the fence and filling in the ditch, had cried out to his fellows: 'Give no heed to this impostor; you are lost if you forget that the produce belongs to all, the land to none.'"

Professor F. W. Newman: "The history of the gradual, stealthy, but really nefarious revolution, in which landlords, by their own legislative power and their

Opinions.

influence over lawyers, changed themselves into land-owners needs to be popularized."

Sir Henry Maine (*Village Communities*): "The terrible problem of pauperism began to press on English statesmen as soon as the old English cultivating groups (in which land was collectively, and not privately, owned) began distinctly to fall to pieces."

John Ruskin (*Time and Tide*): "Bodies of men, land, water, and air are the principle of those things which are not, and which it is criminal to consider as, personal or exchangeable property."

The Right Honorable John Morley (*Interview at Newcastle*, November, 1889): "I have always thought our forefathers made a great mistake when they did not reserve the minerals to the nation."

(*Speech in the House of Commons*, May 6, 1890): "The question of the unearned increment will have to be faced. It is unendurable that great increments which have been formed by the industry of others should be absorbed by people who have contributed nothing to that increase."

Sir William Blackstone (*Commentaries*): "Accurately and strictly speaking, there is no foundation in nature or in natural law why a set of words on parchment should convey the dominion of land."

Ralph Waldo Emerson: "While another man has no land, my title to mine, your title to yours, is at once vitiated."

Judge Hughes (*Speech at Church Congress*, 1888): "The first thing which the democracy will write upon the slate will be the nationalization of the land."

Alfred Russel Wallace (*Malay Archipelago*, 1868): "We permit absolute possession of the soil of our country with no legal rights of existence on the soil to the vast majority who do not possess it. A great landholder may legally convert his whole property into a forest or hunting ground, and expel every human being who has hitherto lived upon it. In a thickly populated country like England, where almost every acre has its owner and occupier, this is a power of legally destroying his fellow-creatures; and that such a power should exist, and be exercised by individuals, in however small a degree, indicates that as regards true social science we are still in a state of barbarism."

Adam Smith (*Wealth of Nations*): "The rent of land, therefore, considered as the price paid for the use of the land, is naturally a monopoly price. It is not at all proportional to what the landlord may have laid out upon the improvement of the land, or to what he can afford to take; but to what the farmer can afford to give."

John Stuart Mill (*Principles of Political Economy*): "The essential principle of property being to assure to persons what they have produced by their labor and accumulated by their abstinence, this principle cannot apply to what is not the produce of labor, the raw material of the earth." "No man made the land; it is the original inheritance of the whole species." "The land of every country belongs to the people of that country."

General Francis Walker (*First Lessons in Political Economy*): "It certainly is true that any increase in the rental value or selling value of land is due not to the exertions and sacrifices of the owners of the land, but to the exertions and sacrifices of the community. It is certainly true that economic rent tends to increase with the growth of wealth and population, and that thus a larger and larger share of the product of industry tends to pass into the hands of the owners of land, not because they have done more for society, but because society has greater need of that which they control."

Professor Alfred Marshall (*Principles of Economics*): "All writers on economics are compelled to make a distinction between land and other things."

LAND BANKS. See COOPERATIVE BANKS; BANKS AND BANKING.

LAND NATIONALIZATION SOCIETY, THE.—The English Land Nationalization Society was established in March, 1881. It was the result of an article written by Dr. Alfred

Russel Wallace in the *Contemporary Review* for November, 1880, under the title of *How to Nationalize the Land. A Radical Solution of the Irish Land Question*. Among the first members of the society were Miss Helen Taylor, stepdaughter of John Stuart Mill; Dr. Elizabeth Blackwell; Alfred Russel Wallace; A. C. Swinton, who suggested the formation of the society; Emeritus Professor Francis Newman, the brother of Cardinal Newman; E. T. Craig, the founder of the Ralahine Colony; and Herbert Burrows. The society has been continuously active in its propaganda, and especially so during the last six years. Its income has also increased now that its principles have become better known. In 1888 one of its Scottish members gave a donation of £500 which enabled the society to organize an extensive series of meetings in the winter of 1888 and 1889. In November, 1889, it founded its monthly newspaper, called *Land and Labor*. In the following summer the society pioneered the open-air agrarian mission work which has since become so well known in connection with the yellow vans of the society and the red vans of the English Land Restoration League (*q.v.*). This work was suggested by a successful experiment with the *Land and Labor* cart which worked in charge of Joseph Hyder, the secretary of the society, in 1890. The following year saw the advent of the yellow and red vans. The van lecturers are best known in the north of the country and in Scotland, they having given especial attention to the mining villages and towns. While favoring the taxation of land values, the society lays most stress upon the actual compulsory acquisition of the land by public authorities. It proposes to gradually "take the land," as distinguished from Henry George's proposal to gradually "tax the rent."

LAND RESTORATION LEAGUE, THE ENGLISH.—In 1883, a few friends who had been meeting at each other's houses for the study of Henry George's *Progress and Poverty*, decided to form a society "to advance the principles laid down by Henry George for the restitution of the land to the people." Among the earliest members of the "Land Reform Union" thus established were Miss Helen Taylor, the Rev. Stewart Headlam, William Saunders, J. L. Joynes (late one of the masters in Eton College), Professor Symes (Nottingham), Minor-Canon Shuttleworth, G. B. Shaw, S. Olivier, Rev. P. H. Wicksteed, etc. From the first the new society entered on its campaign with marked vigor and success. A number of leaflets were issued, including a summary of the argument of Herbert Spencer's famous ninth chapter of *Social Statics*, the accuracy of which, after more than 10 years of uninterrupted publication, has lately been violently impugned by Mr. Spencer and vigorously and successfully defended by the League in the public press. A monthly paper, *The Christian Socialist*, was founded by members of the committee of the new society, and a guarantee fund raised for an extended "Henry George campaign." Mr. George visited England and addressed large meetings in London and the principal provincial towns. At the first annual meeting (May,

1884) the name of the society was changed to "English Land Restoration League." A manifesto drafted by Henry George was issued, and the League settled down to its long siege of the citadel of landlordism. The history of the next few years is an unbroken record of great activity—lectures without number in the London clubs, meetings in town halls, open-air meetings in the parks and open spaces, conferences on the land question, newspaper correspondence, a voluminous output of leaflets and pamphlets, an occasional "Henry George campaign." The only demonstration ever held on the open space in front of the Royal Exchange, in the very heart of the city of London, when Mr. George pointed the moral of the inscription over the portals of that building ("The earth is the Lord's," etc.), was organized by the League in January, 1885. Shortly afterward, at the general election, two members (J. C. Durant and W. Saunders) were returned to the short-lived Home Rule Parliament. In March, 1886, Mr. Saunders moved the resolution in the House of Commons which referred to the Town Holdings Committee the question of the taxation of ground values. The League has taken an active part in all the recent parliamentary and municipal elections. Just before the general election of 1892 about 40,000 circulars, with a printed paper of questions for candidates, were posted to the members and friends of the League, and a fairly complete record was obtained of the pledges of candidates—in spite of the protest of one Liberal candidate against this method of securing written promises "which might be used against the candidate if he should be elected!" Every proposal for "land purchase" has been strenuously resisted by the League, which has protested from the first against "every proposal for buying out Irish or other landlords at the expense or under the guarantee of the taxpayers, or for creating a new class of landlords under the name of 'peasant proprietors.'" It was owing to the persistence of its treasurer in Parliament that the alternative of compulsory hiring was inserted in the compulsory purchase (land) clauses of the Parish Councils Bill. Till the end of 1890 the active work of the League was almost entirely confined to the towns. In 1891 a special fund was raised for village propaganda. A "red van" was fitted out, and a successful campaign was carried on from April 17 to October 22 in the villages of Suffolk. The objects which the red van were intended to serve were (1) the propagation of land restoration principles; (2) the organization of the agricultural laborers; (3) the collection of full and accurate information as to the social condition of the villages. In 1892 five red vans were sent out. During 1894, 531 red van meetings were held. In every case the red van meetings are held in cooperation with a local, self-governing, and independent laborers' union, registered under the Trade-Union Acts.

This article is abridged from an article in the English *Labor Annual* for 1895 by Frederick Verinder.

LAND TRANSFER REFORM.—Under the ordinary forms of proving title to land great

expense is always involved, especially if the land has been transferred a number of times. Indeed, this expense of securing an abstract in such cases and having the title properly examined by a competent lawyer reduces by a heavy percentage the amount received by the seller.

Again, there is frequently great difficulty in securing any clear title to land. An abstract cannot show a clear title; even the careful opinion of a well-trained real estate lawyer is only a ground for a presumptive opinion. If the land has been sold and bought several times, especially if some years have elapsed since such transfer, no one can be sure of his title. Court records show many an instance of innocent purchasers losing land fairly paid for through the defects of the present system of proving titles.

The Torrens system of land transfer, originating in Australia and applied in Manitoba, British Columbia, and Ontario, where the system has been in use for many years and with universal success, has been invented to meet this evil.

The system provides that any land-owner may take his evidence of title to the land transfer office provided by law, and upon proving his title to the satisfaction of the registrar, who acts in behalf of the State, may have his land registered to him as owner, and may receive from the office a certificate to this effect. This registration gives him an indefeasible title; and if he wishes to sell, it is not necessary for him to trace his title beyond the one registration in the land transfer office. The Government guarantees that title. In case of sale, he fills out a simple memorandum of the transfer; this, with his certificate, is taken to the registrar. The transfer is then entered upon the registrar's book and upon the certificate, and the transfer is accomplished. The purchaser has now the indefeasible title with the Government guarantee. It is the *registration* that transfers the title—not the filling out of the memorandum of transfer, nor signing any certificate.

LASSALLE, FERDINAND, was born in 1825 at Breslau, Germany, of wealthy Jewish parentage. He studied at the universities of Breslau and Berlin, devoting himself to philosophy. Humboldt called him "Das Wunderkind." Savigny called his *Das System der erworbenen Rechte* (1861) "the ablest legal book since the sixteenth century." At Berlin, Lassalle, becoming a great favorite, in 1845 met the Countess Hatzfeldt, and for some eight years defended her cause before 36 tribunals on a question of property. In the Revolution of 1848 he was an ardent republican, was indicted for conspiracy and treason at Düsseldorf, and imprisoned six months. On coming out of prison, Lassalle devoted himself to literary and philosophical work, living, however, completely as a man of the world. In 1854 the Hatzfeldt affair was settled, and Lassalle gave himself to the completion of his *Die Philosophie Herakleitos des Dunkeln von Ephesus*, which he published in 1858. He was now to enter on his socialist career. Having lectured on constitutional themes, Lassalle was invited to lecture, on April 12, 1862, before an Artisans' Association in Berlin. It has been called the birthday of

German socialism. In a philosophical and historical way he traced the development of the State and of society, and argued that as the French Revolution freed the third estate, so the Revolution of '48 meant the freedom of the fourth estate. When the lecture was printed, the whole edition of 3000 copies was seized, and Lassalle prosecuted for incendiary utterances. He defended himself, appealing to science as the excuse for his words, but was condemned to pay a fine. Lassalle threw himself into social agitation of every kind. He corresponded with Rodbertus (*q. v.*), but could not draw that philosopher from his books. In 1863 the Leipsic Working Man's Association was undecided whether to follow the cooperative movement of Schulze-Delitzsch (see COÖPERATIVE BANKS) or a more radical social policy. It now wrote Lassalle, calling on him to outline a policy; and he did so in an *Open Letter*, which has been called the charter of German socialism. Lassalle advocated in it the formation of cooperative societies with State aid. He was next invited to appear, together with Schulze-Delitzsch, before the Leipsic workmen, to advocate their respective plans. Schulze-Delitzsch did not appear, but Lassalle did; 1300 delegates were present. Lassalle delivered two addresses, and after 40 delegates had left the hall cheering for Schulze-Delitzsch, the rest voted for Lassalle, 400 to 1. This led to the organization May 23, 1863, in Leipsic, of the *Allgemeiner Deutscher Arbeiterverein* (Universal German Working Man's Association), which was destined to grow into the Social Democratic Party of Germany. Into this movement Lassalle now put all his energy. The apathy of the working men was his chief obstacle, but he succeeded in rousing them. He made speech after speech, wrote tract after tract, held meeting after meeting. All the time he was fighting in the courts prosecution after prosecution, defending himself, and usually winning. Berlin, Leipsic, Frankfurt, and the industrial centers on the Rhine were the chief scenes of his activity. His greatest success was on the Rhine, where, in the summer of 1863 and 1864, his travels as missionary of the new gospel resembled a triumphal procession. He claimed that he had converted the king, Bismarck, and Bishop Von Ketteler, of Mayence (*q. v.*). Bismarck certainly received this remarkable man into his friendship, a friendship which may be regarded as historic because of its political results. (See BISMARCK; GERMANY.)

Socialistic Activity.

The task of winning Berlin over seemed an impossible one; but Lassalle loved difficulties. "Berlin *must* be mine," he wrote, "before six months are passed. I will invest it. Let me only have 200 working men and I shall have 2000, and soon the whole of them." Already he had prepared the way for operations by the circulation of 16,000 copies of an *Address to the Working Men of Berlin*, in which he endeavored to show that the Progressists were unmanaging the artisan, and also sought support for his Productive Associations. Two principal factors played against Lassalle's prospects of success in Berlin. The one was the predominance of the Progressist Party, which controlled the

press, and the other was the hostility of the police. It is not a little singular that Lassalle was perpetually being denounced as a tool of the reaction, while at the same time the emissaries of the law were ever dogging his steps and serving him with indictments for high treason.

At the end of June Lassalle was compelled to recruit his strength in Switzerland, and he remained absent from the scene of agitation until September.

The Association did not make the progress which Lassalle had expected. In August, when it had existed a quarter of a year, the members only numbered between 900 and 1000, Hamburg and Harburg having together 230; Elberfeld, 223; and Leipsic 150, while Berlin had only 20. Lassalle had already shown that he was discouraged, but he urged his followers to fresh energy. During the winter of 1863-64 Lassalle's time was divided between the work of his association and an extensive series of disputes with law courts and official bodies. In January, 1864, he produced a volume of nearly 300 pages against Schulze-Delitzsch, in tone undignified, sometimes coarse, yet always strong. But Lassalle's main work was for the Association. In August, 1864, however, he went for a vacation to Switzerland, and found there a Fräulein von Donnegis, whom he had met previously; they became betrothed. As she was induced by her parents to reject him, he fought a duel over her and was wounded, and died the night of August 30-31. He was buried, amid the universal lamentations of the working men, in the Jewish cemetery at Breslau. The Countess Hatzfeldt was at his side when he died, and continued to aid the Association after his death. There was some division, but the Association grew till it joined the movement organized by Marx, and with it formed the Social Democratic Party of modern Germany.

But his death in itself worked for socialism. It created the greatest interest. Heine called him the Messiah of the nineteenth century. The people called him the Father of Social Democracy. Until Lassalle entered public life the working classes had been without organization, and had wandered about like sheep without a shepherd. Thus the more advanced organizations which followed the Universal Association owe their existence and success largely to his almost unaided exertions.

Lassalle did not lay claim to any special originality as a socialistic thinker, nor did he publish any systematic statement of his views.

His aim was not scientific or theoretic completeness, but the practical one of organizing and emancipating the working classes; and his plans were promulgated in occasional speeches and pamphlets, as the crises of his agitation seemed to demand. Yet his leading ideas are sufficiently clear and simple. Like a true Hegelian, he saw three stages in the development of labor: the ancient and feudal period, which, through the subjection of the laborer, sought solidarity without freedom; the reign of capital and the middle classes, established in 1789, which sought freedom by destroying solidarity; and the new era, beginning in 1848, which would reconcile solidarity with free-

His Views.

dom by introducing the principle of association.

His chief insistence was on what he called and has since been called (*q. v.*) "the iron law of wages," a simple development of Ricardo's teaching. He argues:

"The simple working man who has only his two hands possesses nothing unless he is able to sell his labor to others. He may sell it cheap or dear, but the price, more or less high, does not depend on himself alone; it is the result of the bargain he makes with his employer. This latter pays as little as he possibly can, and since he can choose from among a vast number of laborers, he prefers the one who will work at the lowest rate. The laborers are thus obliged to lower their prices in competition with one another. In every kind of labor it must therefore result—and such is actually the case—that the wages of the laborer are limited to the exact amount necessary to keep him alive."

He was not a force revolutionist, and hence his immunity in the courts.

LATIN UNION. See BIMETALLISM.

LAUGHLIN, JAMES LAURENCE, was born at Deerfield, O., in 1850. He was educated at Harvard University, and appointed instructor in Political Economy in that University in 1878, becoming assistant professor in 1883. From 1888-90 he was President of the Philadelphia Manufacturers' Mutual Fire Insurance Company. In 1890 he became Professor of Political Economy and Finance at Cornell, and in 1892 head professor of Political Economy at the University of Chicago. He has published *Saxon Legal Procedure* (1871), *The Study of Political Economy* (1885), *The History of Bimetallism in the United States* (1885), *The Elements of Political Economy* (1887). He is known as an advocate of gold monometallism, and as a leader among the more conservative economists of the United States.

LAVATORIES.—The following article is abridged from the Report of the Sub-Committee on Baths and Lavatories of the New York Committee of Seventy.

A lavatory is the euphemism for the convenience of water-closets and urinals, altho, strictly speaking, the lavatory is that part of the convenience provided with set bowls, soap, and towels. In some cases a small fee is charged for the use of these conveniences, while in others they are free; frequently those charging the fee are self-supporting. Paris and other continental cities provide urinals on the sidewalk or in small buildings. In the congested part of London, these accommodations must be underground.

It is surprising to find the almost universal lack of these provisions for public convenience in our American cities, and it is startling that a community so intelligent as that of New York should be so far behind Europe in those matters so essential to the health of the city. Especially is this to be noticed in our railroad stations, ferry-houses, docks, and public buildings. At the beginning of 1895 Boston had 21 public urinals; Brooklyn, none except in parks; Chicago, none; New York, none except in parks; Philadelphia, 7; St. Louis, none except in

parks; Birmingham, England, had 96; Liverpool, 222. The system is, however, just beginning in England, and many English cities have none.

Many of the conveniences in London are underground because the surface of the ground is already occupied. An ornamental iron railing, an inscription tablet and a lamp are the indications of the convenience. That in Piccadilly Circus, in front of the "Criterion," is one of the largest. The estimated number of people using this convenience in one year was 5,000,000; \$9692 were taken at the convenience. The initial cost was about \$17,500. The fee is generally a penny.

To avoid any hesitancy in visiting a public convenience, designs have been recently submitted in London for what are called *ladies' châlets*. These are to be built in open sites in the parks or at the junctions of streets. It is also a part of the scheme that they shall be self-supporting.

This kind of a convenience is divided into two parts—a shop for the sale of millinery or small notions and the lavatory, the entrance to which is through the shop. It was found that the accommodations for men were much more ample than for the women, hence it was hoped that the *châlets* would obviate that difficulty. The estimated expense of these conveniences is about \$2000, and it is calculated that each will yield a rental of \$60, which amount would defray the interest on the cost, while the income from the lavatory will meet the operating expenses with a possible margin of profit, dependent on the location. A parcel room is an additional adjunct of this system.

In New York City, the saloons supply what the city fails to provide. This is done to attract customers. The lavatory accommodations are as ample and as clean as it is possible for them to be built, and many of them will compare very favorably with those in the finest-appointed hotels. A writer speaks from personal experience of a first glass of liquor drank for no other reason but as a means of compensating the saloon-keeper for the use of his closet, but which was the direct cause of subsequent humiliation and misery.

Lavatories are specially needed in the tenement district. In very few tenements are there water-closets on each floor. The usual accommodations are a row of water-closets in the court-yard and a urinal in one corner. The conditions are again complicated by the fact that the court-yard is also the passage-way for the occupants of a rear tenement. Under the very best conditions such arrangements are unsanitary, especially when used by ignorant or careless people. But apart from any considerations like these, such accommodations are a constant obstacle to modesty and refinement. All through the tenement-house district are shoals of children; hence the more reason why the community should interest itself in insisting that every precaution conducive to morality and purity should be taken in behalf of its growing citizenship. As a result of this report, steps in this direction are already being taken in New York City, and are being proposed elsewhere. (See BATHS.)

LAVELEYE, ÉMILE LOUIS VICTOR DE, was born in Bruges in 1822. He studied at Bruges, the Collège Stanislas in Paris, and the University of Ghent. In 1865 he became Professor of Political Economy at Liège University. In politics he was a Liberal, in religion a liberal Roman Catholic. He was a constant contributor to the *Revue de deux mondes*, and a voluminous writer. Among his best-known books are his works on agricultural economics and on bimetallism—*e.g.*, *La Question d'or* (1860); *De la propriété et de ses formes primitives* (1874), translated into English by G. S. Mar; *Socialisme contemporaine* (1881, new ed. 1893). He died January 3, 1892. Laveleye was often considered a liberal academic socialist.

LAW, JOHN. See MISSISSIPPI SCHEME.

LAW AND ORDER LEAGUES are leagues organized for the enforcement of law. The Law and Order League of Massachusetts was organized May 31, 1882, especially for the enforcement of the restrictive features of existing legislation regulating the liquor traffic. The idea grew, and on February 22, 1883, representatives of 27 Law and Order Leagues, located in eight States, met in Tremont Temple, Boston, and formed the "Citizens' Law and Order League of the United States," to be a "bond of union and a means of communication between the several leagues throughout the country." The organization holds annual meetings. At Toronto, Canada, in 1889, the name was changed to "The International Law and Order League."

The following is from the constitution :

ARTICLE II.—OBJECT.

"The object of this League shall be to maintain the principle that the enforcement of law is essential to the perpetuity of good government, and by promoting the formation of State and local leagues having the same object in view, between which it shall be a bond of union and means of communication, to secure in all proper ways the enforcement of existing laws relating to the liquor traffic, and all offenses against morals and the peace and good order of society, and to encourage and assist the authorities in maintaining and enforcing the same.

ARTICLE III.—MEMBERSHIP.

"Those persons shall be members of the League who are approved by the executive committee, and, being in sympathy with its object, contribute the sum of \$5 annually for support."

Law and order leagues work usually by disseminating literature, holding public meetings, prosecuting offenders against the law, investigating evils, etc. The organ of the League is *Lend a Hand* (Boston).

LAWSON, SIR WILFRID, of Aspatria, Cumberland, was born September 4, 1829, and succeeded to the title and estates of his father, who died in 1867. A lifelong advocate and supporter of the temperance movement, he became its chief representative in Parliament, being elected for Carlisle in 1859. In March, 1864, he first moved for leave to introduce the measure known as the Permissive Bill, the main principle of which is the giving to two thirds of the inhabitants of any parish or township an absolute veto upon all licenses for the sale of intoxicating liquors granted within their districts.

The bill was supported by 40 members. Mr. Lawson was displaced at the general election of 1865; but in that of 1868, on appealing to the enlarged constituency as a supporter of Mr. Gladstone, he was again returned to Parliament. He succeeded, on June 18, 1880, in carrying his "Local Option" resolution by a majority of 26. In 1885 he stood for the new Cocker mouth division of Cumberland, but was defeated by a Conservative majority of 10. In 1886, as a Gladstonian Liberal, he gained the seat by a large majority. Sir Wilfrid is in favor of the disestablishment of the Church and the abolition of the House of Lords, and standing armies.

LECLAIRE, EDMÉ JEAN, was born in 1801, and at the age of 17 he arrived penniless in Paris. He became a journeyman house painter. In 1827 he set up on his own account, and was successful. By 1834 he was chosen to paint the Bank of France and other large buildings. He worked, however, not only for himself. By a series of experiments he learned how to avoid the use of poisonous white lead. On February 15, 1842, Leclaire announced his intention of introducing a system of profit sharing among his men. He was laughed at and suspected by his men; but when he divided 11,866 frs. among them—\$50 on an average to a man—they ceased to laugh. From 1842-47 an average of \$3750 was divided among about 80 men. In 1838 he established a mutual aid society among his men. In 1853 he organized a complete system of profit sharing, and in 1860 established a system of old age pensions. In 1864 the society became incorporated as the Mutual Aid Society. In 1865 Leclaire retired and became *maire* of Herblay, where he died July 10, 1872. The month before his death the Maison Leclaire divided \$10,000 between about 600 men. The society still lives. (See PROFIT SHARING.)

As was the case with many of those who have applied genius to philanthropy, the fountain of Leclaire's enthusiasm was essentially religious, tho of a kind unconnected with the special dogmas of any particular Christian body. How intensely he held the "great commandment" of Christian morality appears from the following words written in sight of death, when he felt "sincerity" to be "more than ever a duty" :

"I believe in the God who has written in our hearts the law of duty, the law of progress, the law of the sacrifice of one's self for others. I submit myself to His will, I bow before the mysteries of His power and of our destiny. I am the humble disciple of Him who has told us to do to others what we would have others do to us, and to love our neighbor as ourselves; it is in this sense that I desire to remain a Christian until my last breath."

LECLAIRE, ILL., is the home of the N. O. Nelson Manufacturing Co.'s works, where Mr. N. O. Nelson (the founder of the firm) is developing a cooperative manufactory and village. The company, which is engaged in manufacturing plumbers' supplies, and has its office in St. Louis, Mo., commenced in 1886 a profit-sharing system, and still continues it.

After paying regular wages and 6 per cent. interest on capital, it sets aside 10 per cent. of the profits for a reserve fund to meet losses, 5

per cent. of the profits for a provident fund to care for the sick and the families of deceased employees, and then divides the remainder at the rate of 2 per cent. on wages to 1 per cent. on capital. The dividends on wages have in seven years amounted to 54 per cent. The provident fund is managed by a committee of employees elected by themselves. The working day has been reduced to nine hours a day at regular 10 hours' pay, without any apparent diminution in product. Later, the company acquired its present tract of 125 acres of land 18 miles from St. Louis, with the purpose of erecting factories and building homes for its men. The village was called Leclair in honor of the founder of profit sharing. It now contains a half dozen brick factory buildings, heated by steam and lighted by electricity, water-works, a cooperative store owned and conducted by the men, a bowling-alley and billiard-room, a lecture hall and library. A kindergarten and school, a band, and a literary society have been organized. The streets are not run at right angles, but, in the manner of park roads, are paved with cinders, and skirted by four-foot sidewalks and lines of trees. Cottages of good architectural design are built for employees on plans adopted by themselves, and are paid for in monthly instalments slightly in excess of the city rents. These houses are built on lots of about one third of an acre, with a building-line of not less than 40 feet, are supplied with water and electric light, water being free and the lights 25 cents a month. The streets are sprinkled and lighted by electricity free of charge. By common consent no vegetable gardens are made about the premises, the grounds being devoted to grass, shrubbery, fruit trees, and small fruits. A neighboring coal mine supplies coal slack for the factories at \$1 a carload and lump coal at 70 cents a ton, which the cooperative store buys and retails to its members at the local retail rate. Once in two weeks a lecture is given by university professors from St. Louis, by professional men, and by other capable lecturers. The lectures are always given to large and attentive audiences. Every other week the literary society has an essay or a discussion, singing and reading. The kindergarten has more than anything else enlisted the enthusiasm of the residents in Leclair, and has drawn a number of children from the adjoining town of Edwardsville. The educational plan contemplates successive steps through the kindergarten, manual training in connection with the shops for boys, and domestic training for girls, so that at the age of 18 or 20 a good school education shall be accompanied by skill and experience in work, and with a regular occupation awaiting each graduate. It is hoped to develop the cooperative features till the factory and the whole village can be made completely cooperative.

LE PLAY, PIERRE GUILLAUME FREDERIC, was born at La Ravière, Saint Sauveur, in 1806. Deeply impressed with the sorrows of the poor around his early home, he came to Paris to study in the Ecole Polytechnique. Graduating with honors, he started, in 1829, with Reynaud, and traveled for many years through all Europe studying social facts.

In 1840 he was appointed to the Chair of Metallurgy in the School of Mines, and later was Inspector-General of Mines. Coming under the notice of the emperor, he was repeatedly appointed at the head of various scientific expeditions, particularly that of 1867. In 1855 he published his *Les ouvriers européens*. In 1856 he founded *La société internationale des études pratiques d'économie sociale*. In 1864 he published *La réforme sociale en France déduite de l'observation comparée des peuples européens*; in 1870, *L'organisation du travail*. In 1872 he founded *Les unions de la paix sociale*, which, in 1890, had 3000 members. In 1881 was commenced *La réforme sociale*, the organ of these unions. In its first number it declared that France, in the present century, had had 11 revolutions and 19 successive constitutions, as the result of utter chaos in social ideas. Hence it argued the need for conclusions drawn from the patient study of facts. Le Play is often called a Liberal Christian Socialist; yet, tho a Roman Catholic, he does not emphasize religion, and is as opposed to socialism as to *laissez faire*. He simply desired truth drawn from facts, and set himself and his followers to collecting these. His remedy for social ills is a rehabilitation of the powers once vested in the father of a family and in the conductor of a workshop. The family organization is not to be patriarchal, but what he calls the *famille souche*, with a restoration of the now limited freedom of bequest. H. Higgs has written the best English account of Le Play in the *Quarterly Journal of Economics*, Boston, July, 1890.

LEROY-BEAULIEU, PIERRE PAUL, was born December 9, 1843, at Saumur; studying in Paris, Bonn, and Berlin, he traveled extensively in England and on the Continent, and held editorial positions upon the staff of several prominent journals and magazines; he was Professor of Finance in the School of Political Science. In 1880 he succeeded Michel Chevalier at the College de France. Leroy-Beaulieu is an adherent of the old liberal school. His chief work is his *Traité des sciences des finances* (4th ed., 1888), the best French work on the subject, and full of learning and research. He is also well known for his *Le Collectivisme* (1885); *La répartition des richesses* (1888); *L'état moderne et ses fonctions* (1890).

LESLIE, THOMAS EDWARD CLIFFE, was born in Ireland in 1837. He was called to the English bar, but turned his attention to literature, and contributed to the quarterly magazines. He was Professor of Jurisprudence and Political Economy in Queen's College, Belfast, for 25 years. He died in 1882. Cossa says of him in his *Introduction to Political Economy*:

"His learned and eminently readable tracts on applied economics all take up questions of reform, and he is especially pointed in his arguments against indirect taxation, and in favor of emancipating land tenure from the last remnants of feudal bondage. His schooling was partly under Sir Henry Maine and partly acquired by his own frequent and extended travels. By this means he acquired convictions regarding the historical development of economics which led him to take a position unique in Great Britain, where he was for a long time the solitary and always the most enthusiastic adherent of views which

Roscher and Knies defended in Germany. The manuscript of his most extensive work was lost in 1872, so that all that we now have to represent him is scattered through various reviews in the shape of essays. . . . He rejects in so many words the fundamental principle of the classical schools—their conception of the desire for wealth upon which all their deductions depend—because it is at one and the same time too vague and too one-sided."

LEXOW COMMITTEE.—This was a committee appointed January 30, 1894, by the Senate of New York State, to investigate the Police Department of New York City. The appointment of the committee was the result of the charges of the Rev. Charles H. Parkhurst (*q. v.*), President of the Society for the Prevention of Crime. Dr. Parkhurst had made careful and even personal investigations of disreputable resorts, and accumulated much evidence of violations of the law and of complicity of the police. His charges stirred up great excitement, and he was vehemently opposed by the city officials. The agents of his society were persecuted, and one of them was charged with crime and convicted, tho, as the society claimed, innocent. The existence of corruption in the Police Department had, however, now become so evident that the New York newspapers took the matter up and supported Dr. Parkhurst. Their demands doubtless secured the appointment of the Senate Committee. The sessions of the committee lasted from February till the end of the year, a recess being taken during the summer. John W. Goff was the counsel. The committee could only expose, but not convict. The result of the investigation was that 67 men in the Police Department were shown to be guilty of crime, among whom were 4 commissioners or ex-commissioners, 4 inspectors or ex-inspectors, and 22 captains or ex-captains. Most of these men were afterward regularly indicted as a consequence of the testimony against them before the committee. Dr. Parkhurst's course was thus completely vindicated, and he received many tokens of popular approval. An anti-Tammany reform ticket was triumphantly elected in the fall of 1894.

It is, however, true that the final results of the Lexow Committee's work have not been satisfactory to the public. It is stated that the results obtained in 1894 and 1895 cost the State of New York \$76,534. Yet on January 1, 1896, not a single person who was exposed by the Lexow Committee had begun to serve a term of imprisonment. There were 40 indictments dismissed, 35 indictments, at the above date, not yet tried, appeals, disagreements of jury, and reversal of conviction, in one case, by the Supreme Court.

LIBERALISM AND SOCIAL REFORM.

—Historically, English liberalism has been a middle-class movement, having its origin among the Puritans. The decay of feudalism, the growth of the towns, the expansion of trade, had all combined to render the English middle class the strongest power in the State by the middle of the seventeenth century. That power was tested by the overthrow of monarchy and the rise of a middle-class House of Commons to supremacy. The attempted reaction by the later Stuarts failed, and the so-called "Glorious Revo-

lution" of 1688 was made by the junction of the middle class with the Whig aristocracy. The financial and commercial policy adopted, including the founding of the Bank of England and the national debt and the high tariff, was conceived in the interests of the commercial class. The policy thus founded by a commercial Puritanism was reinforced by a body of ethical and economic philosophy contained in the writings of Locke, Adam Smith, Priestley, Franklin, and others. These writings furnished the English middle classes with a rational body of doctrine, which may, perhaps, be summed up in the word "liberty." It was necessary to remove the old feudal restraints, the old political restraints, and the old restraints imposed on liberty of speech, publication, and worship. Above all, according to the doctrine of liberty and enlightened self-interest, it was essential to remove restrictions on the power of accumulation, for the liberty to accumulate, and so enlarge trade and employ labor, was assumed to be the foundation of material prosperity. To this doctrine of liberty there were, however, two exceptions, both dictated by class interest. Commerce and manufactures were "protected" by a high tariff through the whole of the eighteenth century, and the first quarter of the present century in order to secure an English monopoly. That tariff was only abolished when it was no longer needed by capitalist interests. The second exception lay in the denial of the right of combination to workmen, who in its absence were unable to meet the capitalist on equal terms. This right was not conceded until 1824. Thus far the liberal movement in England (which, by the way, did not receive that name until after the French Revolution of 1830) appears as a purely *laissez-faire* movement, and such it fundamentally was. But there also existed with it, side by side, a genuinely democratic movement, which at times flamed out into activity. The "Levelers" and the "Fifth Monarchy" men represented this movement in the time of the Commonwealth; Thomas Paine was its most conspicuous figure at the end of the last century, while the tradition became deposited in the first half of this century in the Chartist Party. The Radicals (heirs of the "root and branch" men of the Commonwealth), as they came to be called, kept up their own organization and agitation, but they united with the more progressive section of the Whigs in a resistance to the reactionary policy of Pitt's cabinet, and afterward to the similar policy of Addington, Percival, Lord Liverpool, and Wellington. This progressive section of the Whigs, led by Charles James Fox, separated itself from the moderate body, inspired by Burke, on the subject of the French Revolution. The ethico-philosophic tradition derived from Locke was continued in our century by the so-called "Philosophic Radicals," of whom James Mill and George Grote were the chiefs; who, while acting largely with the Liberals, yet held on their own way, content to permeate the party as a whole with their spirit and ideas.

Having thus traced the genesis and growth of liberalism, we are able to see, on the one hand, its leading aim—liberty—and on the

other its somewhat complex construction, arising from the varied elements which entered into its composition. For it not only had its right and left wings, but different economic interests played upon it. In the main the Tory Party was the party of the old landlord interests, the Liberal that of industrial interests, altho during the reaction of Pitt capitalist as well as landlord supported the Government of the day. It is not until the scare produced by the French Revolution has died away that we are able to see with

any clearness the inherent tendencies of the parties. The great revolt against toryism which resulted in the reform ministry of 1830 and the Reform Bill of 1832 was brought about by a combination of the middle-class Liberals with the working class Radicals. The former held

the economic doctrines which we associate with the names of Ricardo, Senior, and Bastiat, and which were, in the main, derived from the *Wealth of Nations*. These doctrines assumed "freedom of contract not only as a sound theory, but as an actual fact, from which was to be deduced the dogma of *laissez faire*. The Radicals, perhaps, held to the same doctrines, which were dear to the older school of trade-unionists, to whom the State meant the old tyrannical class state of pre-reform days. What the Radicals hoped was that equality of political rights would favor a really free competition, with the result of economic advantage for all. What happened after reform was that the middle-class Liberals passed middle-class legislation and alienated their Radical allies, who, finding that reform had not produced the benefits which were expected, revolted against liberalism and initiated the Chartist movement. The six "points" of the Charter, though entirely political, were, nevertheless, intended to bring about social and economic results by constitutional means, the political movement being aided by an economic revolt against machinery as the cause of industrial dislocation and by the new movement of socialism, led by Robert Owen, and which found many friends among the Chartist leaders. The application of a rigid *laissez-faire* policy to industry had resulted in frightful horrors, which intensified the misery arising out of lack of employment, as machines took the place of men. The troubles of the time are best pictured in Carlyle's *Past and Present*, tho the whole literature of the period is penetrated with the sense of social wrong and insecurity. What was to be the attitude of liberalism to this state of things? The leadership of the party had drifted completely into the hands of the Whig aristocracy, but they were without a policy. The success of Chartism or the backward movement toward Tory reaction would have been certain had it not been for the rise of the free trade movement. This movement diverted the great stream of liberalism into one narrow channel, and kept it within these confines for over a generation. The free trade leaders were the bitter opponents of all the factory and mining legislation, due to the energy of Owen, Sadler, Shaftesbury, and others, but they had the advantage of knowing their economics and of having a direct simple program of re-

form which was merely a development of the doctrine of liberty already implicitly contained in liberalism. Their object was to remove the last vestiges of aristocratic rule and to render the middle class absolutely supreme in name and fact, with abundance of free raw material and cheap labor, and with the ownership of the land, which, it was assumed, could be gradually acquired by the middle class through the abolition of entail, primogeniture, and settlements. The aim is stated in a letter addressed by Cobden to Bright, October 1, 1849: "The citadel of privilege in this country (*i.e.*, landlord privilege) is so terribly strong, owing to the concentrated masses of property in the hands of the comparatively few, that we cannot hope to assail it with success unless with the help of the propertied classes in the middle ranks of society, and by raising up a portion of the working class to become members of a propertied order." The free-trade movement, while destroying the old tariff, had no effect on the land system of England, so that it produced no fundamental economic change, and for a considerable time there can be no doubt that, apart from a little tinkering at factory legislation, liberal politicians believed economic finality had been attained and that "natural forces" would, in time, solve those problems of pauperism which still stared them in the face. English commercial supremacy was unchallenged, and English trade was, on the whole, brisk and sound. This condition of things, roughly speaking, obtained from the abolition of the Corn Laws till the end of Mr. Gladstone's first premiership.

Then came a change. The consolidation of Germany had led to a great industrial expansion in that country, while the wave of protectionism which has engulfed the whole world brought about high tariff legislation, thus cutting off many former English markets. A series of bad seasons, aided by the growing importations of American wheat, brought about the decline of agriculture. The formidable signs of the grave discontent which had arisen made themselves felt first in Ireland in the famous movement of the Land League. On the other hand, a great change had taken place in the structure of society. Commercial magnates, enriched by free trade, had become conservative, and had in many cases allied themselves by marriage to the aristocracy, while some sections of the working classes, disappointed at the results of liberalism, had become Conservative also, tho the great body remained Radical, but without any serious reason beyond a vague dislike of privilege, costly royal grants and pensions, etc. Thus parties stood at the beginning of Mr. Gladstone's second premiership, neither standing on any genuine platform of principle in the economic sphere. It was reserved for the Irish to begin the new movement. Tho as a party the Irish Nationalists had no genuine economic doctrine, and were divided among themselves into advocates of land nationalization and individual peasant ownership, yet the movement which they initiated, aided by the powerful effect produced by Mr. Henry George's *Progress and Poverty*, dealt a tremendous and probably fatal blow at the old theory of land ownership as held by the old Liberal Party.

The legislation which the Irish compelled was of course a compromise, but it put an end to the dogma of "freedom of contract,"

The New Socialist Movement.

and asserted the paramount rights of humanity over mere vested interests. At this time, however, a new and more powerful force than that of the Irish began to affect England—the new socialist movement. We have seen that socialism in England began with Robert Owen, but the times were not then ripe, the capitalist system of industry not having developed its own inherent contradictions. Consequently the social movement slept for over a generation, during which time, however, the adoption of a national system of education (in 1870) had stimulated both intelligence and discontent. The appearance of modern socialism in England dates from 1881, but the movement did not become formally and consciously socialist until 1883. At first it was of the crude revolutionary character, but it has since become more practical and parliamentary in its methods and aims. The internal quarrels within the ranks of socialism prevented it from exerting much influence as an electoral factor until the formation of the Independent Labor Party in January, 1893. But tho it was not securing votes, the new socialist influence was being felt, especially by the Liberal Party, which had exhausted its old program of "liberty." People had all the "liberty" they needed, and many had more than they knew what to do with; it was social opportunity that was now demanded. The Liberal rather than the Conservative Party was affected because it had been the party of the intelligent working classes and the reformers of greater moral earnestness. For some time, however, no response was made. The Liberal leaders were absorbed in Irish Home Rule to the exclusion of almost every other question. The program adopted by the National Liberal Federation at Nottingham in 1887 was so barren as to call forth loud remonstrances from those eager for the alliance of liberalism and labor. The agitation which arose led ultimately to the adoption in 1891 of the so-called "Newcastle Program," drawn up and accepted by the delegates of the National Liberal Federation at the Newcastle meeting of that year. That program is a political *pot-pourri*, containing sops to the various sections of the Liberal Party and its Irish allies, such as disestablishment for the Welsh, "local option" for the temperance vote, village councils for the agricultural laborer, together with a socialistic and democratic infusion, including the taxation of land values and incomes, advanced factory legislation, payment of members of Parliament, and the second ballot. It was on this program that the Liberals and Irish won the general election of 1892. The chief measures passed by the party during the period which has elapsed are the Local Government Act, by which it is expected that villagers will be able to gradually wrest both rural administration and the ownership of land from class domination; and the Budget of 1894, by which the principle of progressive taxation of income and heavy death duties on real and personal property was definitively established. Thus it is claimed for the

Liberal Party that it is now almost abreast of the new socialistic thought of the period; the newer tendencies of the party being generally described as the "new radicalism." The chief cause of friction, however, inside the party centers about the legislation for regulating by law adult labor. The issue has been the Miners' Eight-Hours Bill, which is strenuously opposed by a minority of the party, including so prominent a man as Mr. John Morley. It may be expected that the closing years of the century will witness an attempt at the completion of the evolution of modern liberalism by shedding altogether the "moderate" or individualist wing, which is visibly declining and must tend to disappear. The new party of progress in England can scarcely avoid being largely collectivist, since it will probably be the outcome of a union of radicalism with the labor movement, nearly all the rich and socially influential classes gravitating steadily to the Conservative Party. But before this consummation is reached liberalism is likely to undergo defeat.

The evolution of liberalism from the last century has thus been traced from a movement of "liberty" to one of "opportunity." It is a characteristic of England that her life does not admit of the development of extreme forms either of progress or reaction. In Germany and France we see extreme reactionary views confronted with extreme revolutionary ideas; we see absolute collectivism face to face with rigid *laissez faire*. Had the Liberal Party been converted to extreme *laissez-faire* theories like the German Liberals or the French moderate Republicans, England would have been the scene of a great separate socialist party, like France and Germany. The extreme Manchester school would have probably brought about this result had not the timely enfranchisement of the working classes modified this tendency and brought liberalism from the narrow channel of mere free trade into the wider stream of modern social thought. Perhaps the newer tendency of liberalism (if we are still to use this word for a great progressive movement) may be best described in the words of Mr. John Morley, taken from a passage in his *Voltaire*, p. 78: "Political liberty, however, has not only a meaning of abstention, but a meaning of participation. If in one sense it is a sheer negative and a doctrine of rights, in another sense it is thoroughly positive and a gospel of duties." The success or failure of liberalism in the transition period in which we are living will mainly depend on whether its adherents can carry out the idea thus expressed. (See also ENGLAND AND SOCIAL REFORM.)

WILLIAM CLARKE.

LIBERTY.—Few words in the English language are more used in the literature of social reform than the word *liberty*, yet few words have been less carefully defined. What definitions have been given have been often contradictory and often utterly unphilosophical. Cicero says: "The essence of liberty is to live just as you choose" (*potestas vivendi ut velis*) (*De Officiis*, Book I., chap. xx.). This is perhaps to-day both the popular and the abstract

conception of liberty; but all science, philosophy, and experience agree to-day in declaring that no such liberty is possible to a finite being. The following quotations will show to what an extent modern science denies that there is any freedom of the will:

"I know of no writer not a theologian pure and simple that goes the length of claiming this for the will" (George Lacy, in *Liberty and Law*, p. 53). "The terms have no application to the subject" (Bain's *Emotion and Will*, chap. xi.). "Man's volitions are not self-caused, but determined by spiritual antecedents, in such sorts that when the antecedents are the same, the volitions will always be the same" (Mill on Hamilton, pp. 492-3). "There is nothing existing in the world which is absolutely alone—entirely free from inseparable relationship to some other thing or things. Freedom, therefore, is only intelligible as meaning the being free from some kind of restraint" (Argyle, *Reign of Law*, chap. vi.). "The will of the animal, as well as that of man, is never free" (E. Haeckel, *History of Creation*, vol. i., p. 237). "The feelings in my consciousness in the moment of voluntary choice have been preceded by facts out of my consciousness, which are related to them in a uniform manner, so that if the previous facts had been accurately known, the voluntary choice might have been predicted" (W. K. Clifford, *Right and Wrong*, p. 162). "Psychical changes either conform to law or they do not. If they do not conform to law, no science of psychology is possible. If they do conform to law, there cannot be any such thing as free will" (H. Spencer, *Principles of Psychology*, Part IV., § 20).

Many theologians and some philosophers assert the freedom of the will, but even they usually maintain that the will is only free within the limits of its own moral nature.

Says T. D. Woolsey:

"For a finite being, moral excellence, united with the greatest perfection of intellect pertaining to human nature, will make the best course of action certain within his sphere of existence (Johnson's *Cyclopedia*, art. 'Liberty')."

It follows that moral deficiencies and lower grades of intellect make lower causes of action equally necessary. As for experience, from the child who cries for the moon to the absolute monarch or the beggar, who both have their wills continually crossed, all life shows that no man can do whatever he will. Scientifically, philosophically, experimentally, absolute freedom for finite beings is an impossibility.

Says F. J. Stephens (*Liberty, Equality, and Fraternity*, p. 13):

"Freedom is only intelligible as meaning the being free from some particular kind of restraint; therefore, in political science, when one speaks of political, economic, or other liberty, one should explain from what kind of restraints freedom is meant."

"From excessive liberty tyranny springs as certainly as a tree from its roots" (Plato's *Republic*).

Economic freedom may not mean liberty, because one may still be the slave of social laws. Hence, in considerations of liberty, freedom must be balanced with freedom, and the greatest amount of freedom chosen. Thus, moved by various considerations and influenced by various social, political and industrial environments, liberty has been very variously conceived, as the following definitions will show:

"Liberty consists in the safe and sacred possession of a man's property" (Fox, quoted by W. Roscher, vol. i., p. 236). "Political liberty consists in security, or, at all events, in the opinion that we enjoy security" (Montesquieu, *Spirit of the Laws*, book 12, chap. ii.). "Liberty is the freedom to do what the law permits" (Montesquieu, *Spirit of the Laws*, book 2, chap. iii.).

Bentham makes liberty to consist in the freedom to follow 14 specific sources of pleasure, which he names (*Principles of Morals*, vol. i., chap. v.). Mill says that liberty "is the principle that the sole end for which mankind are warranted individually or collectively in interfering with the liberty of action of any of their number is self-protection" (on *Liberty*, p. 6, People's Edition). According to Sheldon Amos, "Liberty on its positive side denotes the fulness of individual existence. On its negative side it denotes the necessary restraint on all which is needed to promote the greatest possible amount of liberty for each" (*Science of Law*, p. 90).

For other conceptions of liberty and a discussion of the ways by which it is proposed to secure to-day the highest amount of liberty, see ANARCHISM; INDIVIDUALISM; SINGLE TAX; SOCIALISM; SPENCER.

LIBERTY AND PROPERTY DEFENSE LEAGUE, THE.—Founded for the purpose of maintaining freedom of contract, upholding proprietary rights, and resisting socialistic legislation, the Liberty and Property Defense League has from its inception, in 1882, occupied a unique position in English politics. Associated with neither of the two great political parties in the State, it has consistently opposed the tendency toward socialism which during each succeeding year of the last quarter of a century has become more and more marked in the legislation of the British Parliament. The League opposes all attempts to introduce the State as competitor or regulator into the various departments of social activity and industry, which would otherwise be spontaneously and adequately conducted by private enterprise. Questions of the structure or constitution of the State and those of foreign policy do not come within the scope of the League. It is exclusively concerned with the internal functions or duties of the State. During the last 15 years all industries in the country have successively suffered at the hands of the State an increasing loss of their self-government. These apparently disconnected invasions of individual freedom of action by the central authority are in reality so many instances of a general movement toward State socialism, the deadening effect of which on all branches of industry and originality the working classes will be the first to feel. Each industry conducting its self-defense without any reference to the others has on every occasion hitherto failed to oppose successfully the full force of this movement concentrated in turn against itself by the permanent officials and the government in power for the time being. The League resists every particular case of this common evil by securing the cooperation of all persons individually opposed to the principle of State socialism in all or *any one* of its instances; and by concentrating into a system of mutual defense the forces of the "defense associations" of the various industries of the country, and of independent companies and corporate societies.

Federated with the League are 160 defense and protection societies, representing railways, shipping, tramways, water companies, manufactures, land and house property, liquor, mining, and the other industries, and the representatives of these bodies form a powerful committee for the purpose of watching the progress of bills through Parliament, and taking steps to

oppose or amend such bills. Strictly speaking, the League is a parliamentary agency for these industries; but while in the main its efforts are directed to opposing or amending socialistic legislation, the League does not neglect the important work of propagating its views. In the press and on the platform, and by the distribution of pamphlets and leaflets, the officials of the League carry on a vigorous propaganda in defense of individual liberty and proprietary rights, and through the medium of such journals as the *Liberty Review* everything is done that can be done to spread and popularize the principles which the League has been established to defend. Among the books and pamphlets which the League publishes and circulates are works by Lord Bramwell, Herbert Spencer, Earl Wemyss, Léon Say, Earl Fortescue, Auberon Herbert, Goldwin Smith, Dudley Field, Wordsworth Donisthorpe, and other well-known writers. As a collection of individualist and anti-socialist literature the list published by the League may be said to be the most complete in existence. At the Universal Exhibition, Paris, 1889, the League was awarded the grand prize for its publications.

That the Liberty and Property Defense League will find plenty of work to do in the future goes without saying. Every succeeding year witnesses an increase in the number of socialistic measures introduced into the British Parliament. From the last annual report of the League it appears that in the list of bills which the League and its federated societies opposed in Parliament during the session of 1893 there were no less than a score relating to property in houses and land; 8 relating to mines, railways, and shipping; 9 relating to textile and other trades and manufactures; and 16 relating to trade in alcohol. According to the League, every one of these measures was of a more or less socialistic character, and contained proposals of an oppressive and predatory kind. In the majority of cases the League's opposition to these measures was successful; and there can be no doubt that, looked at from the capitalist's standpoint, the League has done a large amount of useful work in resisting legislation which aims at restricting individual freedom and hampering private enterprise.

The central offices of the Liberty and Property Defense League are at Westminster Chambers, 7 Victoria Street, London. Branches of the League are in existence in all the large industrial centers in Great Britain, and in France, Germany, Italy, Australia, and New Zealand.

W. C. CROFTS.

LIBERTY PARTY.—The abolitionists (*q. v.*) at Warsaw, N. Y., having informally nominated, in 1839, James G. Birney for President and Francis J. Lemoine for Vice-President, the nominations were confirmed by a convention, ostensibly national, that met at Albany, April 1, 1840, and adopted the name "Liberty Party." Its platform was the abolition of slavery. The candidates received 7059 votes in spite of their having declined the nominations. On August 30, 1844, the national convention of the party met. The topic of greatest interest at that time was the annexation of Texas, and the con-

sequent increase in slave territory. Birney and Thomas Morris, of Ohio, were nominated. The total vote for Birney was 62,263. Had the electoral vote of New York gone to Clay, it would have elected him. In that State the popular vote stood: Polk; 237,588; Clay, 232,482; Birney, 15,812. Had Birney not been nominated, it is probable that enough of his vote to elect Clay would have been so cast—certainly none of it would have gone to Polk. This lesson was not forgotten, and the party did not again name its own candidates. In 1848 and 1852 it supported the Free Soil Party, and thereafter the Republican Party (*q. v.*).

LIBRARIES, PUBLIC.—The oldest libraries known are the Babylonish tablets, found in the mounds of Mesopotamia, and supposed to have been prepared for public instruction about 650 B. C. Pisistratus is said to have founded a library at Athens 537 B. C., but this is not clear. Strabo says that Aristotle was the first collector of a library, and that his library descended to the Romans. The story of the great Alexandrian library founded by Ptolemy Soter, with from 100,000 to 700,000 manuscripts (according to different authors), and burned by the Caliph Omar, is now considered to be a myth, at least as to its size. Many Romans collected libraries. Plutarch says the library of Lucullus was open to all. Pliny says the library of Pollio was the first public library in Rome. St. Jerome says that St. Pamphilus, of Cesarea, in 309, collected 30,000 volumes, chiefly religious, to be lent; if this be true, it was probably the first lending library. The libraries of the Middle Ages were small. The still existing library of the Swiss abbey of St. Gall was one of the first, and claims an antiquity of 1000 years. The first library in England is said to have consisted of nine manuscripts brought by Augustine in 596. As late as Henry VIII. the royal library had only 329 volumes. Matthias Corvinus, King of Hungary, had, in 1490, 50,000 volumes, destroyed by the Turks in 1530. Lorenzo de' Medici, in Florence, established the great Laurentian Library. In 1556 the Royal Library of France, then containing 2000 volumes, received by royal ordinance the privilege of obtaining a copy of every book printed in France. By 1789 it had 200,000 volumes, and is to-day the largest library in the world. Germany has the greatest number of important libraries of any country. The library of the British Museum was founded in 1753. The first library in the United States was that of Harvard College, begun in 1638.

Benjamin Franklin, after considerable effort, founded, in 1732, the Philadelphia Library Company, the "mother," as he himself calls it, "of all the subscription libraries in North America."

In Scotland, in 1816, Samuel Brown, of Haddington, following in part the methods of London booksellers, established a system of free itinerating libraries, loaning without cost selections of 50 books in each package to villages and neighborhoods.

This system was copied in this country in the school district libraries which were started in the State of New York in 1835, and a few years

afterward were in successful operation in Massachusetts and other New England States, and in Michigan and Ohio at least, among States further West.

MUNICIPAL LIBRARIES.

The first free town library in America, or the world, supported by municipal taxation, was established by the efforts of Abel Abbot, D.D., in Peterboro, N. H., in 1833.

Massachusetts in 1847 granted to Boston the right to establish the first large municipal free library. There are in Massachusetts now over 300 free libraries (according to the returns of the Public Library Commission for 1894), or 1233 volumes for every 1000 of population; in New Hampshire something over 100 (in 1894), or 464 volumes per 1000 of inhabitants.*

Professor H. H. Barber says (*American Magazine of Civics*, May, 1895):

"Massachusetts, in 1890, appropriated \$100 to any town that would raise by taxation, or appropriate from the dog tax, or otherwise raise, at least \$50 (or if its valuation was less than \$1,000,000 it should raise \$25, or if less than \$250,000 it should raise at least \$15), and should agree to take care of the books, and furnish the agency of distribution. The sums granted by the State are in the hands of a board of commissioners appointed by the governor (with the advice and consent of the council); and so far these commissioners—librarians and others—have been eminent citizens, serving without salaries, and having only \$500 in their hands annually for clerk hire and traveling expenses. The commission is also required to give advice and information to librarians and others concerning selection of books, cataloging, and administration; and to select and forward the books granted by the State.

"Now for results. The commission has thus aided in establishing, in four years, more than 60 free public libraries in small towns (out of 104 not thus supplied), and its action has shamed a few larger towns into establishing them; so that now only two and three fourths per cent. of the population of the State, in 44 small towns, were in January, 1894, without their advantages. And this has been accomplished with an entire expense to the commonwealth of less than \$100,000. *Per contra*, more than \$500,000 were given by individuals in a single year for similar purposes within the State. . . .

"In 1892, a law was passed authorizing the Regents of the University of New York to lend for a limited time—usually six months—selections of books. . . . At the end of 20 months 125 of these free loan libraries had been sent out by the New York Board of Regents, of which nearly one half (44) went to communities without public libraries, the remainder going to libraries already established (22), to university extension centers (18), and to academy libraries open to the public (22). Eleven thousand nine hundred volumes were thus made accessible to the public, with a total circulation of not far from 25,000 volumes and 9000 readers. This system, which seems even more economical than the Massachusetts one, has greatly promoted interest in good reading, and led to the establishment of several local public libraries."

In 1892 the public libraries in the United States of 1000 volumes or upward numbered 3804 collections, aggregating about 27,000,000. The free library movement is spreading also in Great Britain, Germany, and Australasia. The following are the larger libraries of the world:

	Volumes.
Paris National Library	2,600,000
London British Museum	1,650,000
St. Petersburg Imperial	1,078,000
Munich Royal (including pamphlets)	940,000
Berlin Royal	850,000
Strasbourg University	700,000
Washington Congressional	659,843
Boston Public	597,000
Vienna Imperial Public	570,000
Oxford University	530,000
Hamburg City	505,000
Leipzig University	504,000
Cambridge (Eng.) University	500,000
Copenhagen Royal	500,000
Stuttgart Royal Public	500,000

Of the value of public libraries, Professor Barber says (see above):

"It would hardly seem necessary to dwell upon the arguments in behalf of the free public library. 'There is probably no mode of expending public money,' says Stanley Jevons, 'which gives a more extraordinary and immediate return in utility and innocent enjoyment.' . . . The cost of the two war vessels just voted by Congress might be abundantly sufficient to insure the organization on the Massachusetts plan of a free library in every village and county town of the United States, not now accessible to such a library.

"In the year 1817 George Ticknor, the distinguished author of the *History of Spanish Literature* and a benefactor of the Boston Public Library, wrote to Edward Everett: 'I would establish a library which differs from all free libraries yet attempted; I mean one in which any popular books tending to moral and intellectual improvement shall be furnished in such numbers that many persons can be reading the same book at the same time; in short, that not only the best books of all sorts, but the pleasant literature of the day, shall be made accessible to the whole people when they most care for it—that is, when it is fresh and new.' . . . Mr. Herbert Spencer and the individualists oppose to the public library, supported by taxation, their well-worn declamation about the injustice of making one man pay for another man's culture and amusement; and urge the dictum of *laissez faire* in civilization and government. But as the post-office and the public school have survived their onslaughts we may not feel compelled to surrender the advantages of the free library. For, as with the school, it is easy to show that mental health and light are as primary interests of the community as material; and that it is precisely because those most deficient are least sensible of their defect that society must seek to remedy it. Mr. Spencer's analogy between hunger for food and hunger for knowledge is utterly fallacious. The physical appetite may be trusted to seek vigorously its own supply; the intellectual appetite has most to be aroused where intellectual starvation is most imminent; and it grows only by what it feeds on. Men usually value most, indeed, what they work or pay for; but it is precisely those who do not value good books at all who need to be tempted and trained to their appreciation. And it is just the children of those whose parents will not, or cannot, provide them wholesome reading, that society cannot afford to let go wholly unprovided.

Objections.

"The smallest fee here proves an effective bar, as the experience of all subscription libraries proves. When the Springfield (Mass.) library was made free, its circulation was trebled the first year, tho the fee had been only \$1. . . . It is sometimes objected that the records of all public libraries show that the lightest literature is most read; that fiction constitutes one half or three fourths of the books circulated. But besides the obvious consideration that only wholesome fiction finds place in all well-appointed public libraries, Horace Greeley's view has much to commend it—viz., that all pure reading, however light, tends to develop a taste for more vigorous and instructive literature. Besides, it may well be urged that fiction is not only the current form of literary art, but also the effective vehicle of current social theories, philanthropies, and reforms; and that much of the most earnest thinking and serious moral purpose of this age is embodied in it. Under such intelligent and careful selection as the public opinion of the community may provide for, the public library will furnish a healthful substitute and corrective for the unappointed and vagrant reading of that large section of young people most in need of guidance."

* Fletcher's *Public Libraries in America* gives the following list of free libraries in the other States: Illinois, 42; Michigan, 38; Rhode Island, 26; New York, 24; Indiana, 23; Connecticut, 23; California, 21; Ohio, 21; Iowa, 15; Vermont, 15; Maine, 14; Wisconsin, 9; Kansas, 9; New Jersey, 9; Minnesota, 8; Pennsylvania, 7; Missouri, 4; Colorado, 3. It should be remembered that these are minimum figures, the returns from some States being very imperfect. On the other hand, some of those returned in all the States, and all of those in some States—as in Pennsylvania—are supported otherwise than by public taxation.

LICENSE. See HIGH LICENSE, also PROSTITUTION.

LIEBKNECHT, WILHELM, was born in 1826, at Leipzig, of poor parentage; he studied at Giessen, Berlin, and Marburg. In the Revolution of 1848 he took part in Baden, and was imprisoned from September to May. He fled to Switzerland and then to England, where he remained till 1862. He was much with Marx, and earnestly espoused his views. In August, 1862, he returned to Germany, and edited the *North German Gazette* till it became a Bismarckian organ, when Liebknecht joined Lassalle's agitation. He became the leader of the International Party in Germany, won Bebel to socialism, and with him worked for the amalgamation of the movements started by Lassalle and Marx, thus forming the Social Democratic Party, of which he and Bebel are still the main leaders. In 1865 he was ordered to quit Prussia. He went to Leipzig and edited a democratic journal till it was suppressed in 1866. Returning to Berlin, he was imprisoned three months. In 1867 he was returned to the North German Diet by a Saxon constituency, and has been in

the Legislature ever since. He was imprisoned in 1870, and for two years beginning in 1872. In 1881 he was expelled from Leipzig under the socialist law. He is not an original thinker, but of high intellectual attainments and a good writer; his *Zur Grund und Bodenfrage* (1874), a work on the land question, being among his best publications.

LIFE-SAVING SERVICE, THE, of the United States commenced in 1849 with an appropriation of \$20,000 by Congress. Previous to this the only organized attempts in this direction were of humane societies like that of Massachusetts, established in 1789. To-day the ocean and lake coasts of the United States are picketed with the stations of the life-saving service attached to the United States Treasury Department.

At the close of the last fiscal year the life-saving establishment embraced 251 stations, 184 being on the Atlantic coast, 53 on the lakes, 13 on the Pacific coast, and 1 at the falls of the Ohio, Louisville, Ky.

The following table gives the results :

	Year ending June 30, 1895.	Since Introduction of Life-Saving System in 1871, to June 30, 1895.
Number of disasters.....	483	8,302
Value of property involved.....	\$10,647,235	\$133,641,974
Value of property saved.....	9,145,085	102,342,047
Value of property lost.....	1,502,150	31,299,927
Number of persons involved.....	51,402	67,258
Number of persons lost.....	20	750
Number of shipwrecked persons succored at stations.....	803	12,013
Number of days' succor afforded.....	2,232	31,353
Number of vessels totally lost on the United States coasts.....	73

LIGHT RAILWAYS.—In Great Britain there has been some effort to get light railways, or railways of comparatively cheap production, and working such as exist in some parts of the Continent, and benefit, it is contended, poor districts and agricultural. The Board of Trade has had power to construct such roads since 1868, but has not yet relaxed its conditions sufficiently to allow them.

LIQUOR TRAFFIC. (See INTEMPERANCE; TEMPERANCE.)—We simply give here statistics of the liquor traffic.

The returns of the Internal Revenue Department furnish a means of very accurately measuring the liquor traffic from year to year. Dur-

ing the last fiscal year, which closed June 30, 1895, there were registered 1949 distilleries of grain, 12 of molasses, and 920 of fruit. There were in actual operation during the year 1621, 11, and 797 respectively. The number of gallons of spirits placed in warehouse during the year is substantially the production of the year. The revenue is paid on spirits when withdrawn for consumption. Beer does not go into bonded warehouses, but the tax is paid at the brewery on the amount produced. The distillery operations are shown by the following statistics of distilled spirits for the years ending June 30, 1894 and 1895, compiled from the Internal Revenue Report for 1895 :

	Gallons.	Gallons.
In warehouse at beginning of year.....	147,894,694	137,993,078
Put in warehouse during the year.....	89,205,491	79,949,595
Total in warehouse.....	237,000,186	217,942,673
Withdrawn from warehouse for export.....	6,114,117	1,312,006
Withdrawn for consumption.....	87,346,834	74,453,039
Withdrawn for scientific purposes.....	74,697	86,100
Withdrawn for transfer, leakage, etc.....	5,471,160	5,694,976
Total withdrawn.....	99,007,108	81,546,121
In warehouse at end of year.....	137,993,078	136,402,552

* States largely under Prohibition by Local Option.

† Prohibition States and territories.

According to the Internal Revenue Report for 1895, pp. 53, 54, there was consumed in the production of spirits, 17,499,711 bush. of grain and 5,802,811 gals. of molasses. This grain produced 79,949,594 gals. of spirits, which is 4.32 gals. of spirits to each bushel of grain, and eight tenths of a gallon of spirits for each gallon of molasses.

In addition, there was produced 33,561,411 bbls. of beer, which, according to Professor Francis Wyatt, director of the National Brewers' Academy of New York City, requires 2 bush. of malt per barrel to manufacture. This, at eighty-four hundredths of a bushel of barley to one bushel of malt, required 56,383,171 bush.

of barley. The total weight of grain used in producing spirits was 948,000,000 lbs.; the barley used for beer weighed 2,706,000,000 lbs., making in all 3,654,000,000 lbs. If this grain were ground into flour and then made into bread, the waste of grinding would be compensated for in the added water for the bread, and a pound of grain would make a pound of bread. This 3,654,000,000 lbs. of grain would, therefore, make an equal number of pounds of bread, or a pound loaf every day in the year to 10,000,000 people, one seventh of the total population of the country. All the statistics in this article are compiled from official and authoritative facts, most of them from Government reports.

GOVERNMENT TAXES ON LIQUORS.

The United States laid an internal revenue tax on liquors for the first time in 1791. A tax of 11 cents was laid on spirits distilled from foreign imported materials, and of 9 cents on spirits distilled from domestic products. Alex-

ander Hamilton estimated the annual production of the country at that time to be 6,500,000 proof gals., of which 3,500,000 gals. were from foreign materials. This tax was the occasion of the famous Whisky Rebellion of 1794. The act was repealed in 1802.

Liquor was again taxed in 1813 to meet the necessities of the War of 1812 with England. This time a tax was laid on distilleries. This tax was repealed in 1818 and no further tax imposed until 1862.

The act of July 1, 1862, created the Bureau of Internal Revenue. The law, which went into effect September 1, 1862, imposed a tax of 20 cents a gallon on spirits. This was raised to 60 cents by the act of March 7, 1864. By the act of June 30, 1864, a tax of \$1.50 a gallon was levied on all spirits, except those made from grapes, which were taxed at 25 cents a gallon. By the provisions of the act the tax was in-

creased to \$2 after February 1, 1865. There was some shifting of rates after this time, until by the act of March 3, 1875, the rate was fixed at 90 cents, at which it remained for 20 years.

The tax on beer has been \$1 per barrel of 31 gals. since September 1, 1862, except for the period from March 3, 1863, to March 31, 1864, when it was 60 cents.

PRESENT TAXES.

The present Government taxes on liquors are \$1.10 per gallon on spirits and \$1 per barrel on fermented liquors. The Treasury collects each year from each dealer in spirits at retail, \$25; at wholesale, \$100; from each dealer in fer-

mented liquors at retail, \$20; at wholesale, \$50; from rectifiers and from brewers of less than 500 bbls. per year, \$50; of 500 bbls. or more, \$100; from manufacturers of stills, \$50; from each still manufactured, \$20.

Previously to August 28, 1894, the tax on spirits was 90 cents a gallon. The period during which liquors could be stored in Government bonded warehouses without payment of tax until liquors are withdrawn was extended from three years to eight years, in the interests of the distillers.

STATE RECEIPTS.

The following table is compiled from the cen-

EXPENDITURES OF STATE AND LOCAL GOVERNMENTS, LARGELY DUE TO DRINK, AND THE RECEIPTS FOR LIQUOR LICENSES, 1890.

* Including county courts, inquiries and inquests.
 † Less receipts from the same.
 ‡ Tennessee makes \$22,923 profit on its penal and reformatory institutions.

sus of 1890, and shows the receipts of State and local governments for liquor licenses during 1890 and the amounts expended to sustain the courts, jails, police, and almshouses, the necessity for whose existence is largely due to the traffic which the licenses legalize. The State and local governments received \$24,786,496 from the liquor traffic, but paid out \$91,841,480, or \$100 for every \$27 received, in caring for crime and poverty, a large part of which came from the saloon. It is well within limits to say that very much of this expense might have been saved were the saloons wiped out. That high license cannot be made to pay the bill is shown by the results in Illinois, Massachusetts, and Pennsylvania, where saloons are taxed the highest, but the expenses due to the presence of the saloon are out of all proportion to the receipts.

In a recent article, Joseph Cook put the case thus: "It has been proven that altho we received \$100,000,000 a year from the liquor traffic, nevertheless \$15 a head is added to our burdens and \$1.60 received. So that the loss to the nation is fifteen to twenty times the income."

THE SALOON IN POLITICS.

The national liquor power is organized upon broad and at the same time compact lines. It has several national organizations, a State organization in nearly every license State, local organizations in all the principal cities of these States, with branches in the various districts, all working together in harmony whenever interests of "the trade" are affected. Among the national liquor organizations are the following:

The United States Brewers' Association is one of the oldest and most powerful of the liquor organizations, having been formed in 1862 for the purpose of influencing congressional legislation in the interests of the brewers. It keeps close watch through its Vigilance Committee of the liquor interests in the various States, especially those affecting the brewers. At its thirty-third annual convention, held in Chicago, June 7, 1893, its board of trustees reported that the United States Association was sending its powerful aid to defeat the Dispensary Law in South Carolina, and to prevent the passage of restrictive liquor laws in the District of Columbia. Associated with the United States Brewers' Association are powerful and compact State brewers' associations in most of the Northern and Western States.

The National Protective Association is a powerful national organization, embracing the principal distillers and wholesale liquor-dealers of the United States. It has branches in several States, with local organizations in the several cities and districts. This association has been largely instrumental in defeating prohibition in several State amendment campaigns, collecting enormous funds from the liquor-dealers and affiliated trades, which it used in subsidizing the press and in securing the local political machinery of the Republican and Democratic parties.

The National Retail Liquor-Dealers' Association was formed some three years ago, and now has State associations in nearly all the States. The headquarters are in Chicago.

Affiliated with these three powerful national organizations and their State and local branches are the numberless German societies of the so-called "Personal Rights Leagues," and the "Turn Vereins" having national headquarters at Chicago. The personal rights degree has affiliations in the principal cities of nearly all States.

The Whisky Trust is another factor in the organization of the liquor power. On May 10, 1887, the leading whisky producers of the country met at Chicago and formed what was known as the Distillers' and Cattle-Feeders' Trust, which within a single year's time became powerful enough to control 85 to 90 per cent. of the spirits produced in the country. Its headquarters are at Peoria, Ill.

The tendency of the liquor interests to still further consolidation is shown by the formation of the English brewery syndicate in 1889. *The Brewers' Journal* of May 1, 1894, published a table showing that the syndicate had purchased 79 breweries, which have been reorganized into 24 new companies, with a capital stock of \$91,202,830, or about two fifths the total capital invested in the brewing business in 1890.

It is a conservative statement to say that these widespread but compact liquor organizations, with their State and local branches, can command at a moment's notice 1,000,000 votes in the United States for the friends and against the enemies of the saloon.

One of the first demands made by the United States Brewers' Association after its organization in 1862 was the abolition of the United States tax on beer, and a committee was sent to Washington to obtain the desired law. So successful was this first effort of the organized liquor power, that at the third brewers' convention held at Cincinnati, October 28, 1863, F. Lauer, of the Agitation Committee, reported "satisfactory interviews with the Congressional Committee on Ways and Means," and the "reduction of the tax on beer from \$1 to 60 cents per barrel."

During the Presidential campaign in 1892 Grover Cleveland was visited by Washington Hering, editor of the *Staats Zeitung*, of Chicago, who informed him that he must, on pain of defeat, insert a declaration "against sumptuary laws" in his letter of acceptance. This Cleveland did, and after his election rewarded this liquor-dealers' agent for his power in throwing the rum vote to the Democracy by his appointment as postmaster at Chicago, with the power to distribute Federal patronage in that city.

The Wine and Spirit Gazette says in its issue of January 29, 1894:

"The liquor vote of this State, a good deal more than 120,000 strong, can, if it will, control all legislation at Albany. It is the balance of power between the two parties. It can make or unmake majorities. Properly led, it can elect any set of men it pleases. It is, therefore, in a position to exercise far greater power and influence than does the Prohibition Party."

In its issue of February 10, 1894, it says:

"There are nearly 200,000 voters in this State who live by the saloon. There are but 30,000 Prohibition voters, all told, in the State. Must the six surrender to the one? But let the one cease its clamor, and the six will consent to take their chances with all citizens, making no effort for special self-protection."

Terence V. Powderly, while General Master-Workman of the Knights of Labor, said :

"If the power lies in you, down in thunder tones the liquor power that debauches the voters. One hogshead of whisky in the city of New York judiciously placed may make or unmake a President. Give out enough glasses of gin in this city and State, and you place the dispenser in the chair of Washington. Where is Tammany's power? Is it not in the gin-mills?"

The New York *Wine and Spirit Gazette*, in its issue of October 12, 1894, thus boasts of the saloon power in electing a Governor and a President :

"The liquor-dealers of the State helped to elect Hill governor in 1885. They strained every nerve in 1888 in his favor, and succeeded in reelecting him Governor and defeating Grover Cleveland. The attitude of the liquor-dealers in the memorable campaign of 1888 has become a matter of political history. In most of the principal cities of the State, Harrison and Hill clubs had been formed which counted among their most active members liquor-dealers. A large sum of money was collected by the liquor trade in this State, and further contributions were obtained from the wholesale trade in Pennsylvania, Ohio, and Illinois, for the express purpose of defeating Warner Miller and reelecting David B. Hill. The money thus collected was, by Governor Hill's direct orders, turned over to Colonel Judson, who was then Hill's military secretary, with the distinct stipulation that it be used exclusively in Mr. Hill's behalf and not for the benefit of Grover Cleveland. Governor Hill was reelected and Cleveland was defeated."

The power of the saloon upon the voter is forcibly shown by an investigation made by Professor J. J. McCook, published in *The Forum* for September, 1892, in which, from secret lists furnished him by politicians, he constructs tables for 20 towns and one city in Connecticut, showing the number of votes that are known to politicians to be purchasable. He finds that 15.9 per cent. of the whole number of votes is venal. The table which follows shows the relation of drink to the voters who can be purchased in two rural towns and in two city wards. It is a very significant fact that in three of these districts, as shown by the summary, out of the total voting population who are intemperate or drunken, there are 79 per cent. that can be bought.

INTEMPERATE VOTERS CAN BE BOUGHT.

DISTRICT.	VOTERS WHO ARE VENAL.		
	Per Cent. of Total Voters.	Per Cent. of Intemperate or Drunken Voters.	Per Cent. of Temperate Voters.

Total of first three dists	11.3	79.0	4.9

THE SALOON POWER IN NEW YORK CITY.

The power of the brewers over the retailers is shown by the large number of mortgages which the brewers hold on fixtures in saloons. An investigation made by Robert Graham, of the Church Temperance Society, into the conditions of New York City, shows that during the year ending in October, 1888, there were 4710 chattel mortgages granted on saloon fixtures, with a total value of \$4,959,578 ; of these 1908, with a value of \$1,702,136, were held by 29 of the leading brewers. No report was made of the number held by other brewers. There were 7808 saloons in New York City in 1888, so that considerably more than one half were under chattel mortgage, "an overwhelming proportion of which was held by brewers."

The control of these powerful liquor associations in politics is shown by another investigation made in New York City by the Church Temperance Society. During the year before the November election of 1884 there were held 1002 political meetings in the 24 assembly districts into which the city was then divided. The connection of these meetings with the saloons is shown by the following table, from which it appears that out of the 1002 primary and other political meetings held, there were 719, or nearly 72 per cent., held in or next door to saloons :

POLITICAL MEETINGS HELD IN OR NEAR SALOONS IN NEW YORK CITY.

The New York City Reform Club, an independent non-partisan body of voters organized to watch legislative interests of that city, publishes each year a record of the assemblymen and senators of the city of New York. In the *Record* for 1889 is described the corrupting power of the saloon in New York City politics in these words :

"There is about one saloon for every 35 voters. Each of these places represents a certain number of votes, the votes of hangers on who, for the privilege of frequenting the saloon and an occasional free drink, are at the command of the proprietor ; and as each saloon serves as a center of political activity as well on election day as for weeks preceding it, the number of votes thus influenced is so increased as to be practically all-powerful. The result appears in the character of the men who are sent to the Legislature. They

are naturally the tools of the saloons because they are chosen by the saloon. . . .

"The further fact that there are 35,000 saloon-keepers in this State avowedly organized for the purpose of securing legislation favorable to themselves, and of preventing legislation which they deem to be unfavorable to their business interests, is too significant to be overlooked or misunderstood, and when it is remembered that each of these saloon-keepers probably controls 10 votes at the very lowest possible estimate, it is not difficult to perceive the danger which threatens the State."

In its *Record* for 1891 the club sounded this warning:

"The City Reform Club is not interested for or against the liquor traffic as such. It is not concerned with the effect of the traffic upon the individual, but only with the influence of the liquor-dealer upon the politics and the government of this city directly and through his influence in State politics. The club observes that that influence is constantly exerted against the interests of the people and on the side of corruption, and it now sees in the liquor-dealers' bill of this year the amazing spectacle of an organized business seeking to subvert for private gain the fundamental principles of our law. The club sees, further, that this business has acquired by constant vigilance, unremitting efforts and large expenditures, enormous power in the politics of this State. In their efforts the liquor-dealers are united without regard to party. They care nothing for political principles. Their united strength is used only for private gain."

HOW THE FIFTY-THIRD CONGRESS DIED.

The Washington correspondent of the *New York Herald* of March 10, 1895, thus describes the closing scenes of the Fifty-third Congress:

"Those curious students of their kind who have attended a New York French ball will be able to grasp the situation and will understand the picture thrown upon the curtain Sunday night at the Capitol. Women there were galore—lively women, white and black; women who would have looked better, perhaps, in pink tights and impenetrable masks. Among them, going and coming, were the wives and daughters of Senators, and the wives and daughters of American nobility from the various States of the Union.

"I saw an aged Senator pass into the private dining-room with two hilarious 'peaches' on his arms, where a bottle of champagne finished the business possibly begun in a committee-room. At the same moment four colored damsels sat in the public portion of the restaurant, having a good time on their own account. A boy of not more than 15 lay sprawling on the small of his back, too drunk to rise, unheeded of the throng bent on their own amusement or refreshment. Four or five attachés of the Senate were at the next table, drinking hard liquor and talking loudly of their extra pay. Two old men in an advanced stage of inebriety were plying a young girl with liquor—a bright young girl of not more than 16, who kept them laughing with her wit and humor. Two women whose calling was plainly indicated in their faces were sipping beer in the corner and soliciting trade on the sly.

"One member was borne away struggling with his captor friends—fighting drunk. A private secretary playfully pulled a distinguished member's beard and poured beer down his neck—on the outside. Some members were in a state that emboldened the proprietor to refuse them any more liquor.

"It is disgraceful!" exclaimed Mr. Murrey to me, 'and it makes me sick. But you see I can't help myself. It is their place—and, confound them, I'm their barkeeper for 12 hours yet.'

"Hearing songs and laughter issuing from an adjacent committee-room, I peeped in as I went by. A woman with her daintily-booted foot elevated on a committee table and a glass of champagne elevated in her hand was singing a merry song, while a dozen members and their friends sat around smoking and enjoying the society of this lady."

GEORGE B. WALDRON.

LIST, FRIEDRICH, was born at Reutlin-

gen, Württemberg, in 1789. Professor of Political Economy at Tübingen in 1817, he resigned in 1819 to devote himself to the development of German industry. Elected to the Diet of Württemberg, he exposed the vices of the administration, and was condemned in 1822 to 10 months' imprisonment. He fled to Switzerland, but returning in 1824, he was imprisoned at Asperg, but later was pardoned and allowed to emigrate to the United States. He settled in Pennsylvania and published here his *Outlines of a New System of Political Economy* (1827), in which he attacked the ideas of Adam Smith, and outlined an economy on a national basis. Having discovered a deposit of anthracite on his grounds, he was able to return to Europe in 1833 with an independent fortune. At first United States Consul at Hamburg and at Leipzig, he settled at Augsburg and devoted himself to an agitation for a suitable system of railway lines and to economic writing. In a fit of despondency he shot himself, November 30, 1846.

Ingram says of him:

"Another element of opposition [to the *laissez faire* school in Germany] was represented by Friedrich List (1798-1846), a man of great intellectual vigor as well as practical energy, and notable as having powerfully contributed by his writings to the formation of the German Zollverein. His principal work is entitled *Das Nationale System der Politischen Oekonomie* (1841; 6th ed., 1877; Eng. trans., 1885). . . . It was particularly against the cosmopolitan principle in the modern economical system that he protested, and against the absolute doctrine of free trade, which was in harmony with that principle. He gave prominence to the *National* idea, and insisted on the special requirements of each nation according to its circumstances and especially to the degree of its development. . . . The nation having a continuous life, its true wealth consists—and this is List's fundamental doctrine—not in the quantity of exchange-values which it possesses, but in the full and many-sided development of its productive powers."

LIVERMORE, MARY ASHTON (*née* RICE), was born in Boston in 1821. She was a pupil and for some time a teacher in the female seminary in Charlestown, Mass. She left here to teach a family school in Virginia, and remained there three years, to return North a radical abolitionist. While teaching at Duxbury, Mass., she met Daniel P. Livermore, a Universalist clergyman, whom she married, devoting herself to aiding him in his work and writing various stories and articles on reform lines, especially on temperance. In 1857 Mr. Livermore became editor and publisher of the *New Covenant*, at Chicago, and for 12 years Mrs. Livermore assisted him in his editorial labors, besides doing outside writing. In 1862 she was appointed one of the agents of the northwestern branch of the United States Sanitary Commission, and during that year she traveled throughout the Northwest, everywhere organizing sanitary aid societies. In the spring of 1863 she was appointed to make a tour of the hospitals and military posts on the Mississippi. At this time sanitary supplies were low, and the most serious results were feared at Vicksburg camps; but by personal appeals, by circulars, and by untiring perseverance and enthusiasm, she secured immediate relief.

Since the war she has labored earnestly in the woman's suffrage and temperance movements. In 1869 she established the *Agitator*, a woman's suffrage paper, but in 1870 became

editor of the *Woman's Journal* of Boston. In 1872 she resigned to devote herself to the platform, and for years spoke five nights in the week for five months in the year.

She has also written continually for various magazines. Mrs. Livermore is much interested in politics, and was twice sent by the Republicans of her own town as delegate to the Massachusetts State Republican Convention, charged with the presentation of woman suffrage resolutions, which were accepted and incorporated into the party platform. She is identified with the Woman's Christian Temperance Union, and for 10 years was president of the Massachusetts Woman's Christian Temperance Union. She was president of the Woman's Congress during the first two years of its organization, has served as president of the American Woman Suffrage Association, and has been prominent in various other movements.

In religion she is a Unitarian, but cares more for life and character than for sect or creed. She is a believer in nationalism, and regards socialism, as expounded in America, as "applied Christianity." Notwithstanding her many years of hard service, she still does more public work than most younger women. Happy in her home at Melrose, Mass., and in the society of her husband, children, and grandchildren, she keeps steadily at work with voice and pen and influence.

LLOYD, HENRY D., was born May 1, 1847, in New York City, in or near which city his mother's ancestors had lived for ten generations. His father was a minister in the Dutch Reformed Church and a descendant of Goffe, the regicide. He was brought up in the strictest orthodoxy, and was graduated at Columbia College, where he also studied law, and was admitted to the New York bar in 1869; but he went, in 1872, to Chicago and secured a position on the *Chicago Tribune*, filling almost all positions up to the editorial staff till 1885, when he retired, partly on account of ill health and partly on account of his radical views. He married a daughter of Governor Bross, and lives in a beautiful home near Chicago, where, with his devoted wife, he has welcomed many a worker in social reform who has been in need of a little rest and sympathetic friends. Both he and his wife live for the cause of the sorrowing and the oppressed. He published in 1890 *A Strike of Millionaires against Miners*, a book in which he describes with thrilling power the plot of wealthy mine-owners against the starving miners of Spring Valley. In 1894 appeared his still better known *Wealth vs. Commonwealth*, a startling exposure of the methods of the trusts, especially the Standard Oil monopoly (*q.v.*). He has written besides numerous essays and articles, such as *The New Conscience* and *The Lords of Industry*. His views are, perhaps, nearer to those of Mazzini (*q.v.*) than any other reformer, tho he holds rather to the religious spirit than the formal religious belief of that great leader. His thought is intensely moral, but he can battle with the sternest in the cause of man, his range of acquaintance in journalistic and literary lines, as well as among public men, giving him wide

influence with those of wealth as well as with those oppressed.

LOBBY.—"The lobby" is the name given to persons, not members of a legislature, who undertake to influence its members, and thereby to secure the passing of bills. The term includes both those who, since they hang about the chamber, and make a regular profession of working upon members, are called "lobbyists" and those persons who on any particular occasion may come up to advocate, by argument or solicitation, any particular measure in which they happen to be interested. The name, therefore, does not necessarily impute any improper motive or conduct, tho it is commonly used in an unfavorable sense.

Says Mr. A. R. Spofford, Librarian of Congress, in the *American Cyclopedia of Political Science*, article "Lobby":

"What is known as lobbying by no means implies in all cases the use of money to affect legislation. This corruption is frequently wholly absent in cases where the lobby is most industrious, numerous, persistent, and successful. A measure which it is desired to pass into law, for the benefit of certain interests represented, may be urged upon members of the legislative body in every form of influence except the pecuniary one. By casual interviews, by informal conversation, by formal presentation of facts and arguments, by printed appeals in pamphlet form, by newspaper communications and leading articles, by personal introductions from or through men of supposed influence, by dinners, receptions, and other entertainments, by the arts of social life and the charms of feminine attraction, the public man is beset to look favorably upon the measure which interested parties seek to have enacted. It continually happens that new measures or modifications of old ones are agitated in which vast pecuniary interests are involved. The power of the law, which when faithfully administered is supreme, may make or unmake the fortunes of innumerable corporations, business firms, or individuals. Changes in the tariff duties, in the internal revenue taxes, in the banking system, in the mining statutes, in the land laws, in the extension of patents, in the increase of pensions, in the regulation of mail contracts, in the currency of the country, or proposed appropriations for steamship subsidies, for railway legislation, for war damages, and for experiments in multitudes of other fields of legislation equally or more important, come before Congress. It is inevitable that each class of interests liable to be affected should seek its own advantage in the result. When this is done legitimately, by presentation and proof of facts, by testimony, by arguments, by printed or personal appeals to the reason and sense of justice of members, there can be no objection to it."

Unfortunately, however, the lobby usually degenerates till it is mainly a lobby in the bad sense. This results almost inevitably from the present industrial system coupled with present methods of legislation in the United States. In the United States legislatures all business goes before committees—not only private bills, but public bills—often involving great pecuniary interests. To give a bill a fair chance of passing, the committee must be induced to report in favor of it. The committees have no quasi-judicial rules of procedure, but inquire into the subject, and usually by giving hearings on the subject to interested parties. If the committee can be gained, the bill usually passes. The fate of a bill, therefore, often really lies in the hands of a few men, tho the responsibility can be thrown on the whole legislature. This gives enormous opportunity for corruption. Great corporations are sometimes interested to the extent of millions on the wording of a bill. Under our pres-

ent system (see PROPORTIONAL REPRESENTATION ; ELECTIONS, etc.) politicians of the lowest type are often elected. They can get large bribes from *corrupt* corporations. This all but compels corporations that desire to be pure to bribe likewise. If the corporation that would be pure does not bribe, the corrupt corporation will gain the legislation and the pure corporation be handicapped. As a result, the average corporation that seeks a bill goes to the legislature with money in its hand, and still oftener it goes with money to buy off legislation that would injure, legislation often simply introduced to make the corporation pay for preventing its passage, or legislative blackmail. The corporation often has to spend money to gain a perfectly just and right bill. It is on this all but inevitable result of present industrial and commercial methods that the lobby fattens. Nor does the money always need to be corruptly spent. A sharp lobbyist, who knows the ins and outs of legislative practice, who knows many of the legislators, who knows who is corruptible and who not, who knows how to bring political influence to bear in this way or that, can often obtain or defeat legislation without the use of money. He may sell his influence, and the corporation money go into his pocket without his buying the legislators. It is in such ways that around almost all American legislatures has grown up "a third house," which is sometimes more influential than the other two.

Mr. Spofford says there are at Washington

"Pension lobbyists, tariff lobbyists, steamship subsidy lobbyists, railway lobbyists, Indian ring lobbyists, patent lobbyists, river and harbor lobbyists, mining lobbyists, bank lobbyists, mail-contract lobbyists, war damages lobbyists, back-pay and bounty lobbyists, Isthmus Canal lobbyists, public building lobbyists, State claims lobbyists, cotton-tax lobbyists, and French spoliations lobbyists. Of the office-seeking lobbyists at Washington it may be said that their name is legion. There are even artist lobbyists, bent upon wheedling Congress into buying bad paintings and worse sculptures; and too frequently with success. At times in our history there has been a British lobby, with the most genteel accompaniments, devoted to watching legislation affecting the great importing and shipping interests."

Says Mr. Bryce (Appendix to *American Commonwealth*, vol. i., chap. xvi.):

"A committee whose action can affect the tariff is of course an important one, and employs a large lobby. I remember to have heard an anecdote of a quinine manufacturer, who had kept a lawyer as his agent to 'look after' a committee during a whole session, and prevent them from touching the duty on that drug. On the last day of sitting the agent went home, thinking the danger past. As soon as he had gone, the committee suddenly recommended an alteration of the duty, on the impulse of some one who had been watching all the time for his opportunity. Women are said to be among the most active and successful lobbyists at Washington."

Another dangerous class of lobbyists are lawyers and ex-members.

Efforts have been made to check the practice of lobbying, both in Congress and in State legislatures. Statutes have been passed severely punishing any person who offers any money or value to any member with a view to influence his vote. It has been repeatedly held by the courts that "contracts which have for their object to influence legislation in any other manner than by such open and public presentation of facts, arguments, and appeals to reason as are

recognized as proper and legitimate with all public bodies must be held void.

It has been attempted to lessen lobbying by restricting the legislatures. Massachusetts has enacted a law compelling all lobbyists to be registered, that it may be known who they are and whom they represent, and exacting an account of all money spent in lobbying. (See CORRUPTION ; PLUTOCRACY ; DIRECT LEGISLATION.)

Revised by H. D. LLOYD.

LOCAL OPTION is that legislative mode of dealing with the liquor traffic which permits citizens to determine by vote whether the sale or furnishing of liquors shall be allowed in a given locality during a specified period. Local option is of two kinds: (1) A general statute may be enacted by a legislature, with limitations, penalties, etc., made applicable to counties, townships, municipalities, or other small districts, which territories may avail themselves, by popular vote, of the provisions of this general law; or (2) a special act may be passed for a given locality with restrictions, penalties, etc., applicable to that territory only.

Local option laws differ widely as to scope of restriction and also as to extent of territory. Some prohibit the vending of all liquors, spirituous, malt, or cider; others prohibit only distilled liquors. Some provide for the sale of certain liquors for medicinal or mechanical purposes; others make no such exceptions. Some prescribe penalties for their violation for the special territory concerned; others leave the whole matter of penalty under a general law, as in the case of other criminal offenses.

As early as 1833 the Georgia Legislature extended to the inferior courts of two counties—Liberty and Camden—the right to grant or to withhold retail licenses. As these courts were elected by the people, the law in effect became optional in its application. Prior to 1833, in many parts of the Union the constitutionality of the license system, or, at least, the right of the State to grant license, began to be questioned. Between 1835 and 1840 local control, in some form, of the license-dispensing policy had been acquired in several States. Six counties in Massachusetts, through the action of the county commissioners, elected by popular vote, refused license. In 1838 Rhode Island and New Hampshire left license optional with the towns. Connecticut followed in 1839. Illinois granted to towns and counties power to suppress the traffic upon the petition of a majority of the adult male inhabitants. The rise of the Washingtonians in 1840, and the general acceptance of their moral suasion policy, practically put an end, for several years, to prohibitory effort. After this wildfire had passed, the movement for prohibition revived, but this time was directed generally in favor of State prohibition, since the local acts were usually repealed after one or two years, and the people began to grow disgusted with such instability. In Wisconsin, Iowa, Indiana, Connecticut, and Michigan, a large number of towns had been carried for prohibition; in Iowa, all the counties except Keokuk. Soon Ohio and Michigan made the granting of license unconstitutional.

Most of the local option of this period fell still-born or died in early infancy. After State prohibition had begun to be agitated, little more effort in behalf of local option in the *ante-bellum* period was made. Toward the close of the war Rhode Island engrafted local option upon her license law. Pennsylvania had a local option law from 1872-75; Massachusetts followed in 1881. New Jersey's law was repealed almost without a trial. All the Southern States now have local option in some form.

The advocates of local option claim for it :

1. That it secures and has secured prohibitory laws over much territory where general prohibition, through State enactment, was impossible. Witness the large number of counties, townships, districts, and municipalities all over the land where such local prohibition is in effect to-day.

2. That it does not force prohibitory laws upon local communities not ready for them, and where, if forced upon the community they would not be obeyed, and so would act as a demoralizing element and aid to free liquor.

3. That by the retention of this live issue, popular attention cannot be diverted from the saloon's enormities; the public cannot grow indifferent to the ever-present question, but must be constantly on the alert, for safety can be the reward only of eternal vigilance. So the local option condition may become an important factor in educating a people to the horrors of the traffic and the necessity for its suppression.

4. That the system, by steadily eliminating the traffic, tends gradually toward general prohibition, to which it is, therefore, a kind of stepping-stone.

5. That the option principle accords best with popular ideas of local independence—sentiments everywhere prevalent in our democratic polity.

The opponents of local option claim :

1. That the system ignores the moral element in law. With majority rule set up as the origin of right, and so weakening the stronghold of prohibition, the system is necessarily of a legislative and political character. The very enactment of such a law means that the crime side of the liquor traffic is denied, or, at least, not universally accepted—communities, if they choose, being allowed by the State to license the traffic.

2. That the system may be made so non-partisan that neither of the chief and law-making parties will dare endorse the measure, so that the battle against intemperance is left out of the political contests of the day.

3. That local option, like license, makes revenues local, but expenses general, interesting the local community in gaining the revenue of license, thus engendering local selfishness.

4. Local option, operating in this local, selfish manner, scattering and disintegrating the temperance forces and preventing unity of purpose and of effort, effectually militates against State and national prohibition.

5. Local option impregnably fortifies the traffic from without, while it can be assailed only from within. Forty-four States are powerless against a single hamlet or county. A treaty of non-interference stands with the world outside. Five hundred saloonists may concentrate in a town or county, bid defiance to the nation, and

sell their liquors to debauch the whole country. Only at their own sovereign will can liquors be removed, while they, on the other hand, may have the land for a prey.

6. Local option often leads to a seesaw between license and no license in alternate years, and so brings both systems into disrespect.

7. As a consequence, the enthusiasm of first temperance efforts dies out, and it is next to impossible to preserve or to rearouse it for repeated elections. An abnormal tension—even in religion—cannot be maintained, for enthusiasm is not man's normal state.

8. Local option has to prohibitionists the character of a "suspect" from its correlation and companionship with license. The latter appears always as the alternate or supplement to the former. Both are local in operation; both involve permission to the traffic; the theory of each contemplates the continued existence of the traffic; neither proposes to touch the manufacture or importation of liquors; neither attacks the internal revenue system—the money power of the traffic; neither deals with the State as a whole.

9. The system stands always as a compromise measure. Its basis is temporizing, temporary expediency. It is the commercial method of dealing with the traffic. It is made to stand aside in the interests of parties, cliques, politicians, and schemers. (For other methods of dealing with intemperance, see NORWEGIAN SYSTEM; SOUTH CAROLINA DISPENSARY SYSTEM. See also TEMPERANCE for the movement in England.)

LOCKE, JOHN, was born at Wrington, Somersetshire, Eng., in 1632. His father, a small landowner and attorney at Pensford, was a strict but genial Puritan. "From the time that I knew anything," Locke wrote in 1660, "I found myself in a storm which has continued to this time." He entered Westminster School, and in 1652 went to Oxford. He took his degree of A.B. in 1656, and that of A.M. in 1658; was made tutor of Christ Church in 1660, and lectured in Greek, rhetoric, and philosophy the following year. Locke was particularly attracted to the works of Descartes, which first gave him a taste for philosophical subjects.

In 1666 Lord Ashley, afterward first Earl of Shaftesbury, came to Oxford for his health. Locke met him, and in 1667 became his secretary, and in 1673 became Secretary of the Board of Trade. He now made the acquaintance of many public men, and his powers ripened rapidly.

Among the writings of Locke during this period is an essay on the *Roman Commonwealth*. But the most significant of all is an *Essay Concerning Toleration* (1666).

The fall of Shaftesbury in 1675 enabled Locke to spend four years of quiet in France, at which time at intervals his *Essay on the Human Understanding* was in process of construction, and here he enjoyed the society of distinguished men of letters and science. He returned to London in 1679. Shaftesbury was for a time restored to power, and Locke's old confidential relations with him were resumed; but after Shaftesbury's downfall Locke retired to Hol-

land in voluntary exile. The *Essay* was finished in 1687. He returned to England in 1689, and it was after that time that his fame as an author was established throughout Europe. He declined the embassy to Brandenburg, and accepted instead the modest office of commissioner of appeals. While in London (1689-90) he published his chief works on social polity, the *Epistola de Tolerantia*, addressed to Limborch, and the *Two Treatises on Government*, in defense of the sovereignty of the people; his *Essay on the Human Understanding* appeared in 1690. Locke died October 28, 1704, at Oates, in Essex, where Sir Francis Masham had given him a home for many years. He passed away, as he declared, "in perfect charity with all men, and in sincere communion with the whole Church of Christ, by whatever names Christ's followers call themselves."

Locke is of importance in social reform because he is the intellectual father of the eighteenth century philosophy, which, in France particularly, produced revolutionary ideas. Says Cousin:

"Placed between the seventeenth and eighteenth centuries he forms the transition from one to the other. In fact, run over all the sensualistic philosophers of the eighteenth century, there is not one who does not invoke the authority of Locke, and I do not speak merely of metaphysicians, but of moralists, publicists, and critics."

The essence of Locke's philosophy is that there are no "innate ideas." He says:

"Let us suppose the mind to be, as we say, white paper, void of all characters, without any ideas: how comes it to be furnished? Whence has it all the materials of reason and knowledge? To this I answer, in one word, from experience; in that all knowledge is founded, and from that it ultimately derives itself" (*Essay on the Human Understanding*, Book II.).

From his standpoint materialistic and un-Christian philosophers argued, as Locke did not, an individualistic revolt against the authority both of State and Church. As Locke in his *Civil Government* argued against arbitrary rule, they argued against all rule. (See POLITICAL SCIENCE; NATIONAL LIBERTY.)

LODGING-HOUSES.—In every great city the cheap lodging-house, where the homeless poor can pass a night if they are not yet absolutely destitute or dependent upon charity, are among the most wretched spots to be found, and often centers of vice, if not of crime. In Germany, and to a less extent in the United States and other countries, clean and cheap lodging-houses are frequently being opened by private charity. In England, and to a less extent elsewhere, municipal lodging-houses are being tried.

As long ago as 1853 Huddersfield established a municipal common lodging-house, and 20 years later Glasgow tried the same experiment on a larger scale. Since 1879 the corporation has maintained six lodging-houses for men and one for women, in which beds are let at from 3*d.* to 4*d.* per night. Merely as a commercial experiment this proved a success, and the £87,000 invested has yielded a net return varying from 4½ to 5½ per cent. in the years 1881-88. The result upon the character of the inmates is, however, far more important than any pecu-

niary result. These municipal lodging-houses are admirably managed; there is a comfortable recreation room, in which lectures are delivered, and music produced by an official "harmoniumist," while all possible facilities are provided for washing clothes, cooking, etc. London (*q.v.*) has opened at least one lodging-house, and they are being discussed everywhere.

Reference: Shaw's *Municipal Government in Great Britain*.

LOMBROSO, CESAR, was born in Venice in 1836. He studied medicine at Turin, and entering the army in the campaign of 1859, was soon made surgeon. In 1862 he took a professorship in diseases of the mind at Pavia, and later became director of an establishment for the insane at Pisaro. From here he went to Turin as Professor of Medical Law and of Psychiatry. He has written many works, particularly on criminology (*q.v.*) and criminal anthropology (*q.v.*), on which he is a leading authority.

LONDON.—London is of special interest in social reform because of its size, giving to its social problems an extent which compels attention, and because of its importance, as in a sense the commercial metropolis of the world. "A province covered with houses," it exceeds all Ireland in population; if it were emptied, the whole of the inhabitants of Scotland and Wales together could do no more than refill it; the three next largest cities in the world could be combined without outnumbering its millions.

Originating, it is supposed, in the Celtic *Llyndin* (Lake Fort), Latinized into *Londinium*, Tacitus mentions it in 61 A.D. as a trading center. In 809 it was the capital of the East Saxons, and was made by William the Conqueror (1066) the capital of England and given a special charter. Since then it has steadily grown, and latterly by absorbing whole towns and villages, as will be seen by the following table:

Growth.

YEAR.	Population.	Percentage of England.
1350.....	90,000	3.60
1600.....	180,000	3.27
1700.....	550,000	9.16
1801.....	864,055	9.72
1851.....	2,362,236	13.18
1881.....	3,814,571	14.69
1891.....	4,232,118

The "administrative county" of London, with its 58 parliamentary constituencies, measures 16½ miles in extreme length (east and west), and 11¼ miles in extreme breadth (north and south). This area comprises 75,490 acres. Of its population, less than two thirds are native born. In 1891, 66,463 were natives of Ireland, 53,390 of Scotland, 26,920 of Germany, 10,360 of France, 26,742 of Russia and Poland—mainly Jewish, the whole Jewish population being estimated from 60,000 to 70,000; 4903 were natives

of the United States. The death-rate in 1892 was 20.6.

According to statistics (1893-94) printed by the London County Council (*g.v.*):

"The net emigration—the excess of departures over arrivals—in 1881-90, shown by comparing the actual increase of population with the excess of births over deaths, was 117,789, and it is estimated that this was the result of a gross immigration for settlement of 183,015 country-born and 37,830 foreign-born persons, and a gross emigration for settlement of 338,634 London-born persons. These figures are highly conjectural, but probably not far wrong. Many of the emigrants, of course, settled close outside the county boundary in the suburbs, into which the net immigration was about 277,000. In corroboration of the conjecture that the large majority of the emigrants found their homes in outer London, it might have been mentioned that the number of London-born persons in Middlesex, Surrey, Kent, and Essex rose from 299,288 in 1881 to 479,747 in 1891. The area ruled by the Council begins to show the symptoms of depletion, and if the general growth of population goes on as at present, the county will soon become nothing but an enlarged copy of the 'old city.'

The demands of the army and navy are mentioned as 'the chief cause' of the fact that the number of women between 20 and 25 is abnormally large in proportion to men of that age. But successive registrars-general imagine themselves to have proved in census reports that the number of women returned as between 20 and 25 is largely swelled by falsehood, and this is probably the chief cause. Another cause in London may be the large number of country-born domestic servants. The proportion of women among the immigrants into London is much larger (1176 women to 1000 men) than among natives of London resident in England (1106 men to 1000 women), and probably a considerable portion of the excess would be found at the age of 20 to 25 if we had ages and birth-places tabulated in conjunction. A reduction of the school-board rate in years to come is, perhaps, foreshadowed by the fact that the number of children of the elementary school class, between the ages of three and five, enumerated by the visitors, fell from 174,741 at Lady Day, 1892, to 168,437 at Lady Day, 1893. The number of births in London has been stationary for so many years."

London is governed in the city proper (only 671 acres, with a population of 37,705) by a corporation consisting of a lord mayor, 26 aldermen, and 206 common councilors.

The lord mayor is the chief magistrate, with a salary of £10,000, an official residence (Mansion House), and is elected annually by the burghers or free citizens of the various city companies, survivals of the old guilds. (See below.) The 26 aldermen are elected in the 26 wards by those who have the parliamentary suffrage. (See ELECTIONS.) The rest of London is governed by the London County Council (*g.v.*), created in 1888, and by the vestries or district councils as organized in 1894.

The greater part of the municipal administration, if we measure it by the annual expenditure, is carried on by these 43 "district councils," known as vestries or district boards of works. Every year the County Council spends nearly £2,000,000. But the 43 vestries and district boards spend annually over £2,500,000.

Until recently it was almost impossible for the ordinary citizen, especially the ordinary workman, to take any real part in or to exercise any effective control over London's local administration. Its members practically elected themselves in so-called parish meetings. But the Local Government Act of 1894 (the Parish Councils Act) has altered the whole position.

A London vestry has now nothing to do with the Church. It is merely the name given to the council elected by the inhabitants of a London parish to manage their local affairs. Most of the public work that would in a borough like Croydon or West Ham be done by the Town Council and in a populous suburb like Tottenham or Ealing by the Local Board (now called an Urban District Council), is carried out in London by the Vestry.

These "district councils" are the local sanitary authorities. This means that the whole business of keeping London healthy falls primarily on them. They have to manage the paving, cleaning, lighting, and watering of the streets. They arrange for the emptying of dust-bins, the removal of all refuse, and the prevention of nuisances. They must provide and maintain the local drains. They are responsible for seeing that no man or woman lives in a house that is overcrowded or so unhealthy as to be unfit for habitation. They have power to insist that all workshops shall be healthy, properly ventilated, not overcrowded, and provided with sufficient water-closets, separate for each sex. They are bound to take care that all bake-houses are kept in a proper sanitary state. They must see that no food or drink exposed for sale within the parish is so adulterated as to defraud the purchaser, or so as to be injurious to health. They can acquire and maintain gardens, playgrounds, and open spaces. It is through them that the parish can get public baths and wash-houses, a free public library (by poll of the parish), a public mortuary and disinfecting station, and a cemetery where the dead can be buried with the least possible expense.

In many parishes, moreover, the Vestry performs the duties of the overseers, and becomes thus responsible for the valuation of all the land and houses within the parish, and for making up the register of parliamentary and county council elections.

The Local Government Act of 1894 also makes important changes in London, as elsewhere, in connection with the boards of Poor Law Guardians. The qualification for electors and candidates will, henceforth, be the same as for the London Vestries, except that registration or residence anywhere within a "union" will qualify a candidate to be elected for any ward of any parish in that union. The 30 poor law unions do not always correspond with the Vestry or District Board districts, but (with one exception) the ward, or actual electoral area, is the same for both elections.

For parliamentary representation London has 27 boroughs represented by 59 members (some of the boroughs being divided—London University has one member). In 1893 there were 466,504 persons in London who would, under the present law, be entitled to vote in parliamentary, County Council, and Vestry elections; 20,302 with the parliamentary, but not the County Council or Vestry vote; 75,641 with the parliamentary and Vestry, but not the County Council vote; and 82,922 with the County Council and Vestry, but not the parliamentary vote.

In 1892 the value of the imports into and ex-

ports from London was £226,749,916. The amount of money passing through the London clearing house in 1893 was £6,478,013,000. There were published in

Statistics. London 5706 separate works; 700 newspapers are published. There are 170 breweries. Hotel-keepers

and publicans number 6688. There are 15,613 bakers and 14,365 butchers. The building and furnishing of houses, employ 600,000 people; machinery, 20,665; millinery and clothing-making, 120,000 women. The cheap clothing trade is enormous. In 1891 the value of "apparel" exported from London was £3,096,152. There are 250,000 women servants.

The following statements as to London economic and social conditions are abridged from a paper by Sydney Webb on *The Reform of London*, published by the "Eighty Club" (1894) or in a few instances from more recent tracts of the English Fabian Society:

"What London most needs is efficient organs of collective life, and, first, an untrammelled county council.

"The 118 elected councilors, with 19 coopted aldermen, form, indeed, the nucleus of an admirable corporate body, but their powers are, at present, rudimentary, and their functions absurdly limited. In any other city of Great Britain local functions are fulfilled by the Vestries and District Boards of Works; others by the national Government; others, again, are left to the tender mercy of private speculators. Above all, there is the division, overlapping, and waste caused by the continued separate existence of the unreformed city corporation in the midst of municipal London.

"As a consequence of this neglect the London of today is plundered and despoiled on every side. Its water supply is in the hands of eight monopolist companies, who charge £1,000,000 a year more for the absolute necessity of life than its distribution costs, the balance going to pay an average of 7 per cent. on the swollen nominal capital of the shareholders. By the quinquennial revaluation of 1891 the ratable value of the metropolis jumped by at least a million sterling, implying a corresponding increase of the water rates, averaging 4 per cent. of nearly a million sterling and in the assumed salable value of the companies' income. This addition is due not to new buildings, but exclusively to the unearned increase of land values during the quinquennial period.

Monopolies.

In 1896 a similar rise will almost certainly be registered, involving a further free gift to the water companies.

"Seven of the eight companies draw their water mainly from the Thames and the Lea, and the growing population of these river valleys constantly increases its impurity. And altho an expert Royal Commission reported in 1893 that Londoners might rely without actual danger on the water of the Thames and the Lea for another 40 years, it is doubtful whether Londoners will be content so long to drink the diluted sewage of the half a million inhabitants of the upper valleys.

"Three colossal gas companies, with a capital of 15,000,000, extort a tribute of over 1,000,000 average net profit from the metropolis, which they pay as 7 per cent. average dividend to their shareholders. This dividend is regulated by a sliding scale under the well-known act of 1876, which prescribes a maximum dividend, varying according to the price charged per 1000 feet. When, therefore, the companies find their margin of profit reduced, they are able to make their customers recoup them by raising the price of gas, as the Gaslight and Coke Company showed us by its 24 per cent. rise in 1890-91.

"The present market price of the London gas capital is about 25,000,000 sterling, on which 1,000,000 is paid annually in dividend. The County Council could purchase this, even at the market price, by issuing stock-bearing interest to the amount of £750,000 only, and so obtain a clear around profit of a quarter of a million.

"Of all the monopolies, however, which oppress the Londoner, none is more scandalous in its origin and disastrous in its operation than that of the markets. The City Corporation provides and controls eight markets, through which passes practically the whole

meat and poultry supply, and nearly all the fish. The 'Trustees of the Borough Market,' appointed by the Vestry of St. Saviour, Southwark, obtain a large income from London's main potato market. The Baroness Burdett-Coutts and Mr. Plimsoil have attempted to provide markets at Bethnal Green and Walworth respectively. But the Duke of Bedford is still allowed to take the tolls of London's chief vegetable, fruit, and flower market at Covent Garden, which was established in 1661, while Sir Julian Goldsmid, M.P., and the Scott family are the proprietors of Spitalfields Market, established in 1682. These proprietors enjoy legal power to prevent any other market being established within seven miles if it diminishes their profits; and they derive their 'rights' from charters of King Charles II.

"These monopoly rights are derived not from any express charter or enactment, but by an old inference of the common law. What Charles II. gave to the Duke of Bedford's ancestor and Sir Julian Goldsmid's predecessor was merely the permission to hold a market; it is the lawyers who invented the doctrine that such a permission implies the prohibition of competing markets within about six miles and two thirds. (See the case, *Great Eastern Railway vs. Horner*, in which the proposed Shoreditch Market was stopped by the owners and lessee of Spitalfields Market.)

"Out of the total, moreover, the Duke of Bedford draws at least £15,000 a year from Covent Garden flower market, with the adjacent streets fouled for his profit and cleansed at the cost of the rate-payers; Sir Julian Goldsmid, M.P., gains a clear £5000 a year net rental from his monopoly of the right to hold a market by Spital Church.

"In 1890 the House of Lords refused the County Council the power even to inquire into the market scandal.

"The docks are in private hands. Four great dock companies have expended a capital of over 20,000,000 sterling in providing dock accommodation for our greatest port, but they have so wasted their resources in reckless competition with each other that less than half of this capital can be considered as earning a dividend, and four years ago the East and West India Company, owning over 5,500,000 of capital, had to suspend payment even on their debenture interest. As a result, a joint committee was formed, constituting more than half the dock capital, and this joint committee made a working agreement with the two smaller but more successful companies. As in the cases of gas and water, London gave up all safeguards in order to get competition, and has now failed even to secure competition; one small irresponsible committee settles dock charges, and two small committees determine dock wages for the whole of London.

"Official census statistics give little information on this point; but Mr. Charles Booth, with the aid of a staff of assistants, has, during the last years, been making exhaustive inquiries into the subject, chiefly by minute investigations into the books of the 66 School Board Visitors. His results are presented in detail in his book, *Life and Labor in East London*.

"In his paper read before the Royal Statistical Society (see *Journal*, June, 1888), Mr. Booth extended his statistics hypothetically, so as to include all London. He says:

"Taking the estimated percentages of poverty as given in the tables, and the population of 1881, we get a total of 663,943 poor in London; or, with the population of to-day as our basis, rather more than 1,000,000. This number does not include indoor paupers or other inmates of institutions."

"One out of four of the whole population is computed to be earning—and that irregularly—not more than a guinea a week per family; and over a third of these are receiving much less, and, says Mr. Booth, live in a state of chronic want."

Poverty.

"In London one person in every five will die in the workhouse, hospital, or lunatic asylum. In 1887, out of 82,545 deaths in London, 43,587 being over 20, 9399 were in workhouses, 7201 in hospitals, and 400 in lunatic asylums, or altogether 17,000 in public institutions (Registrar-General's Report, 1888, C.—5, 138, pp. 2, 73). Considering that comparatively few of these are children, it is probable that one in every three London adults will be driven into these refuges to die, and the proportion in the case of the manual labor class must, of course, be much greater.

"At least 1,000,000 of London's citizens, belonging to at least 200,000 families, are paying from 2s. to 7s. per week for filthy slum tenements, a large proportion of which would be condemned as 'unfit for habitation' by any energetic sanitary inspector, if only

other habitations were available. The census shows that over 375,000 persons are existing in the soul-devouring purgatory of one-room homes, while a total of 492,000 are crowded together at the rate of three persons or more to each room.

"At least 30,000 of London's citizens have no better resting place than a common lodging-house or the casual ward.

"A small beginning of municipal housing, however, has been made, even in London. No vestry ever exercised the powers for 40 years vested in it by act of Parliament, but the City Corporation has erected blocks of dwellings in Farringdon Road and Middlesex Street, and the County Council has followed in the steps of the City Corporation by building cottages at Limehouse and Deptford, rehousing a whole district at Bethnal Green, and starting to cover 10 acres at Millbank with workmen's dwellings.

"The London County Council has built one lodging-house." (For private philanthropies in this line, see TENEMENTS; WEALTH; TAXATION.)

"The annual rental of the metropolis at the valuation made in 1801 was nearly £40,000,000, which, at 15 years' purchase, represents a salable value of £600,000,000. In 1870 the rental was only £22,000,000, equal to a salable value of £330,000,000. The difference between these sums, £270,000,000, is the increase in the value of London in 21 years. Part is due to new buildings or improvements, and fortunately the annual revision of the valuation list enables us to separate this item in four out of every five years, and to estimate it for the fifth. During 21 years the average yearly increase due to this cause was £501,817, and deducting this amount for 21 years from the actual increment of value for that period, we find that the unearned increment, due solely to causes beyond the control of occupants or property owners, amounts to an average rental of £340,706, or a capital value of at least £4,000,000 sterling added every year to the land of London. This enormous yearly grant to the landlords of London is largely free from taxation.

Rents.

The whole charge for municipal government, maintenance of the poor, and for local improvements—even those which, like the Thames embankment, enormously increase the value of adjacent property—falls at present upon the rates, which (except in case of house property of low value) are almost always collected from the occupier.

"This system of rating has been condemned by committees of the House of Commons in 1866 and 1870, and by the House itself in 1886. The objection to it is that, on the one hand, the owner of property, who pays nothing directly, believes that the burden falls wholly upon him, while, on the other hand, every occupier, when he pays the collector, and knows that an increase of rates does not produce a corresponding reduction of rent, is firmly persuaded that the entire burden falls upon himself. For these two sufferings the public exchequer gets but one tax. The truth seems to lie between the two. Theoretically the annual value of a given house is determined by the competition of other houses of more or less equivalent desirableness, and the tenant pays this value, one part in rent, and the other in rates. If the rates be more, the rent must be correspondingly less, and *vice versa*. But this theory is true only in a purely imaginative state of society, where landlords and tenants are equally and perfectly wise, where there are no leases, and where no expense or loss is incurred in moving from one house to another.

"The difference between the ideal and the real is what the economists call 'economic friction,' and the practical man knows its importance when he takes a long lease and the rates go up in an unexpected manner because the Education Act proves costly, or sanitary reform grows urgent. In the opinion of such eminent authorities as Lord Farrer and Mr. Goschen, a large share of the rates actually does fall on the occupier, and his personal objection to an increase in them is so far justified.

"To meet the difficulty it has sometimes been proposed to enact that the occupier shall deduct from his rent one half of the rate he has paid, thus charging it directly to the landlord. An analogous plan has long been in operation in Scotland, and was strongly recommended by Select Committees of the House of Commons in 1866 and 1870. But the complicated circumstances of London tenure make this plan inapplicable to the metropolis. Without overriding existing contracts it would bring small relief. A landlord's rate of 2s. 6d. in the pound, enacted to fall on the landlord, any agreement to the contrary notwithstanding, would absorb merely the average annual increase of

the value of his estate for the future, and leave him with every penny that he at present possesses. Meanwhile the rates are rising.

"Over £10,000,000 sterling are annually collected and spent by London's public authorities. From 1874 to 1884 the rates rose 60 per cent. Says a tract of the Fabian Society:

"If London, like the great provincial cities, itself owned her public services (after paying the shareholders the full cost of the undertakings), it might save at least £1,500,000 every year—enough to cover half the expenditure on the relief of London's poor.

"The mere annual 'unearned increment' of London would, if appropriated to public purposes, enable the whole of London's million poor to be decently housed, with only the delay necessary for the building operations; and the net annual income from only 'fair rents' on this public property would more than suffice to educate all London's children free of charge."

"In any reform of London's government, the equalization of the rates must be borne in mind. At present the expenses of local administration vary from less than 1s. in the pound in the richer parishes, such as St. James's, Piccadilly, up to 4s. in the pound in such poorer districts as Bromley-by-Bow. This difference is not due to local extravagance, but to the difference in local resources. The City of London (650 acres) and the district of Bermondsey (627 acres) have presumably the same area of streets to keep clean, paved, and lighted; but in the city the cost is spread over property producing over £4,000,000 a year, while it has to be borne in Bermondsey by property worth only one tenth of that sum. Kensington and Poplar each has to watch over the sanitation of about 20,000 houses, and each employs five sanitary inspectors for the work; but the cost of this municipal function is borne, in Kensington, by property worth £2,000,000 a year, and in Poplar by property worth only a third of this amount. This comparison does not bring out the full inequality of the burden, because the poorer sections need much more municipal attention than the rich.

"The city guilds are another unjust institution. These 73 companies are almost the sole survivors of the network of guilds which covered medieval England. Their property, worth about £20,000,000 sterling, is absolutely controlled by the 1500 members of the self-elected Courts of Assistants. The 8000 liverymen are entitled only to a few dinners and the anomalous right to elect the Lord Mayor and Parliamentary representatives for the city. This latter right is the most dangerous possession of the companies; for no radical government can long tolerate so monstrous a privilege, and when once the hand of the reformer has begun to touch the rotten fabric, it cannot easily be stayed. In 1884, a Royal Commission, which included the Duke of Bedford, the Earl of Derby, and Lord Sherbrooke, reported that the income of the companies was public property, and recommended that Parliament should intervene to prevent the alienation of the property of the companies, to divert the corporate income to useful purposes, to modernize the trusts, to abolish the livery franchise, and generally to reorganize the companies. But nothing has been done, and the some of the larger companies have greatly increased the proportion of their income devoted to educational purposes, secret and irresponsible management of essentially public funds still continues.

"In 1870-80, the latest year for which figures are obtainable, their property was returned as follows:

	Corporate Income.	Trust Income.	Total.
73 companies.....	£480,837	£188,148	£668,985
Value of halls, etc., about	100,000	100,000
Probable increase in income in 14 years....	100,000	50,000	150,000
Probable total in 1894.	£680,837	£238,148	£918,985

"The trust funds are those which are admittedly subject to special trusts, and it is mainly out of these that the companies maintain their schools and almshouses, their pensions and doles, about which we hear so much from city defenders. But of these funds over £100,000 was, in 1870-80, spent in dinners; £150,000 was being squandered in management expenses, and

over £40,000 was paid away in fees to the members themselves. This enormous income is drawn from vast estates in London and the country, and from investments. The 12 great companies share among them the administration of the Ulster estates of the 'Irish Society,' and nearly all of them possess valuable halls in the city, and magnificent plate. Of this wealth no accounts are published, and the public services rendered for it are ludicrously insignificant."

REFORMS.

If London social problems are large, her charities are also large, and her reform progress is now rapid. The annual revenue of the private charities of London is reckoned at £5,000,000. (For notices of some of these, see CHARITY ORGANIZATIONS; POOR LAWS; SALVATION ARMY; TENEMENTS; UNEMPLOYMENT.) Quite as marked is London's progress in municipal reforms. Her administrative reforms have been already noticed. (See LONDON COUNTY COUNCIL.) In 1893, 21 of her parishes had public libraries and 21 public baths. Many of her vestries are dealing energetically with sanitary reforms, and commencing to directly employ workmen without contractors and under trade-union conditions. (For other points bearing on London, see CITY; FIRE DEPARTMENT; POLICE; PROSTITUTION.)

The tramway monopoly has already been broken, and the people of London are in a fair way to become possessors of four miles of their own tramway lines. Up to the present the 126 miles of London tramways have been owned and worked by 11 companies, which earned in 1889-90 a profit of nearly a quarter of a million on a capital of about 3,500,000, and paid therefore an average dividend of more than 6½ per cent. The concessions of the companies last only for 21 years, upon the expiration of which the County Council has power to purchase at the actual value of the stock and plant. The resolution to make this purchase as regards the first concession has been already adopted, and it may be hoped that London will now insist that the whole of the lines shall be in this manner gradually taken over. In 1892 the concession for 19 miles of the North Metropolitan Company's system expired, and the Council has decided to purchase the line as soon as the courts of law can decide what Parliament meant by the Act of 1871. The tramway companies have shown themselves unwilling to administer their trust in a manner consistent with the common weal. Their 5000 drivers, conductors, and horse-keepers are among the most cruelly treated and worst paid of London wage slaves. Sixteen hours' work for 4s. pay is no uncommon record, and all efforts of philanthropists and the press have proved fruitless in effecting any improvement. Trade-unionism has also failed in occupations requiring little skill.

LONDON COUNTY COUNCIL, THE, was constituted under the Local Government Act of 1888 (England and Wales). It inherited the powers, duties, and liabilities of the Metropolitan Board of Works and the county justices. The Council consists of 118 elected councilors, who hold office for three years; and of 19 aldermen chosen by the council, who hold office for six years, one half retiring every three years. Of the councilors, four are elected by the city of London, while the remaining 57 electoral di-

visions of the metropolis elect two members each. County electors consist of the householders, men or women, whose names are on the printed register. Lodgers, service occupiers, and freeholders cannot vote at a county council election.

The Council elects its own chairman, vice-chairman, and deputy-chairman. The last receives a salary of £1500, and is the official head of the clerical establishment.

The detailed work of the Council devolves on 21 committees, five special committees, and the Technical Education Board. The committees vary in size from 5 to 50 members.

The Council has nothing to do with paving, cleansing, or lighting the streets; does not control the water-works, gas-works, markets, and police; is almost powerless in valuation and assessment; does not collect its own rates; is neither the sanitary nor the burial authority; is inadequately represented on the Thames and Lea Conservancy Boards; and cannot even prepare or supervise the registration of the voters who elect it.

ITS WORK

Notwithstanding this degradation of the chief municipality of the kingdom below the meanest provincial borough incorporated under the Municipal Corporations Act of 1835, the powers and duties of the London County Council are extremely multifarious. Its Public Health and Housing Committee is not the sanitary authority for the whole of London, but it supervises the administration of the Public Health Act (London), 1891, by the local authorities, with a view to secure an adequate sanitary staff in each district, and as far as possible the enforcement of the law. This committee also administers the Artisans' and Laborers' Dwellings Improvements Act, 1875, and the Housing of the Working Classes Act, 1890, under which insanitary areas and houses all over London are investigated, clearances are made, and new buildings erected in the place of slum dwellings.

The Council has, from the first, built either separate cottages, or, where this has been impossible, dwellings on the self-contained tenement system, which provides for separate sink and lavatory accommodation, and secures for the working-class tenant a distinct and complete little home of his own. The internal fittings and arrangements are made as neat and convenient as possible, an adequate system of ventilation, and a certain cubical capacity for every room, sleeping and living alike, are insisted upon; and, notwithstanding the better accommodation provided, the rents charged are based on those prevailing in the immediate neighborhood.

Through the Building Act Committee the Council has organized a definite attack on the jerry-builder and house-farmer, and has begun to repair the neglect of past years in the clearing away of London's slums and rookeries, with all their evil outcome of intemperance, disease, and crime.

During the first six years of the Council's existence, one new open space was secured for London, on an average, every two months. Every week it adds on an average between three

and four acres to London's breathing grounds and playing fields. In 1888 there were 43 separate open spaces, with an area of 2578 acres, under the Council's control and management; in December, 1894, their number had increased to 75, covering 3647 acres. But the Council's work is not confined to increasing the number and area of these open spaces. It organizes them in such a way as to make the most liberal provision of cricket pitches, football grounds, tennis courts, and gymnasia for both sexes. It supplies lavatories and free public conveniences. It regulates the refreshment tariffs. And, finally, it makes provision for a plentiful supply of music during the summer months by its own uniformed bands.

The main sewers of London (but not the local drains) are under the management of the Council, in whose sludge vessels 2,102,000 tons of sludge were, during 1894, sent to sea. The whole body of sewage used to flow into a vast underground reservoir, in which it was penned by the rising tide, and allowed to flow away with the falling water. The Thames used therefore to receive every day some 200,000,000 gals. of unpurified sewage. Under the improved methods which have been put into operation by the Council, the sewage is subjected to scientific processes, and is passed into the river as an inodorous, innocuous liquid. In consequence, the water in the Thames has been so purified as to make it possible for shrimps, whitebait, dace, and other fish to live where they could not before (even as high up as Woolwich), and the black mud banks have disappeared, and given place to clean shores of gravel, clay, or river sand.

THE PUBLIC.

The Council's work touches on education at two points. It has the management of the industrial and reformatory schools at Feltham and Mayford in its hands. These schools contain boys. In connection with the technical education grants, the Council has organized a Technical Education Board for London. (See INDUSTRIAL EDUCATION.)

The County Council took over from the county justices the licensing of London's theaters, music halls, and dancing saloons; and, whatever mistakes they may have made in the opinion of some people, no one who knows the facts can deny that their work has increased the safety alike of the playgoer and the performer, and has raised the tone of the performances. Its action has wiped out some places which, under the guise of providing public amusement, were hotbeds of debauchery and vice.

The Council has used all its powers to make it possible for people to live a little way out of London by improving the means of communication. Its policy of establishing free ferries, of buying up the tramways, and exerting all its influence on the railway companies, the Board of Trade, and on Parliament to increase the number of workmen's trains and to reduce the fares, both in the case of existing as well as of all newly projected railways, has already resulted in very appreciable advantages to the community, and will be still more fruitful in the near future.

It is now the settled policy of the Council to pay its employees in each trade the recognized trade-union rate of wages, and in no case less than 6*d.* an hour, or 24*s.* a week, to men; or 18*s.* a week to women. Seeing that Mr. Charles Booth places the actual "poverty line" in London at regular earnings of 21*s.* a week, it cannot be said that the Council's "moral minimum" errs on the side of luxury or extravagance. But, unlike the Council's wage for skilled workmen, it is more than is actually paid by many employers; and it is undoubtedly above the rate at which the Council could obtain similar labor if it chose to **Its Employees.** disregard all other considerations.

It is noteworthy that this policy has not led to any ruinous increase in the labor bill. In 1889 the average pay of the wage-staff taken over from the Metropolitan Board of Works was £75 per annum. In 1894, after five years, this average has risen to £78, or exactly 4 per cent.

Wherever possible the Council dispenses with the contractor, and executes its work by engaging a staff of workmen under the supervision of its own salaried officers. The first trial of this experiment was that of watering and cleaning the bridges over the Thames. The new system has now been tried for three years, with the result that whereas the contractor charged 4*s.* 7*d.* to 4*s.* 10*d.* per square yard, the work is now done at an average cost of 3*s.* 2*d.* a square yard, everything included. This, however, was a mere matter of hiring labor, no constructive work being involved. The first piece of actual building executed by the Council was the schoolhouse at Crossness. The architect's estimate was for £1800. The lowest tender was for £2300. The work was completed by the Main Drainage Committee, under its own officers, at a cost of £1764, or £536 under the lowest tender, and £36 under the architect's estimate. But the case that finally convinced the Council was the York Road Sewer. The engineer's estimate was for £7000. Two tenders only were sent in, for £11,588, and £11,608. The work was done by the Council itself, with the result that a net saving of £4477 was made by having the work done without a contractor.

The outcome was the establishment in the spring of 1893 of a Works Committee to execute works required by the other committees. The Works Committee has an entirely distinct staff, and keeps its own separate accounts. Up to the present it has completed and rendered accounts for 29 separate jobs, varying from £100 to £18,785. Sometimes the expenditure works out below the estimate, sometimes above, but, in the aggregate, the total cost of these 29 works—undertaken at the very outset of a new business, with insufficient plant and under manifold disadvantages—comes to £63,061, against the architect's and engineer's detailed and independent prior estimates amounting to £66,061 1*s.* 2*d.* (See CONTRACT LABOR.)

The Council decided in 1891 that contracts for the supply of stores should be entered into for one year only, and in June, 1893, a special committee was appointed. The stores are supplied by 99 firms, and comprise 1817 items, which are classified under 24 headings, the most im-

portant of which are boots, brass fittings, brushes, baskets and matting, clothing, disinfectants, engineers' goods, firewood, fodder, glass, hats and caps, india-rubber and water-proof goods, ironmongery, leather, oilman's sundries, oils, paints and varnishes, rope and canvas, tools, and wrought

Its Finances. and cast iron. The "fair wages" clause is inserted in all the clothing and boots contracts, and the work must be done in the contractors' own factories. The question of establishing a factory of its own, for making boots and clothing, is now under the consideration of the committee.

The ratable value of London is £33,913,707, and the amount raised in 1893-94 was £1,782,509, which is equivalent to 8s. 5½d. per head of the population. Each penny in the rate represents 7½d. per head.

London's finance is complicated by the fact that the Council is not only a borrower, but also a lender. It lends money to local authorities, and receives interest from them. It receives contributions from various local authorities, and from the Government, and thus its receipts are swelled. In 1893-94 the gross debts were over £33,000,000, and the net debts under £19,000,000, having increased by £1,200,000 since the Council came into existence.

The Council's precept for 1894-95 has been for 14d. in the pound, while the last precept of the Metropolitan Board of Works in 1888-89 was only for 10½d. But these figures can no more be fairly placed in comparison than the budget of a lone widow with that of the mother of a large and growing family. The Council's precept includes not only the old charges of the Metropolitan Board of Works, but also several other rates which used to be formerly levied in other ways. The result is, that as regards the majority of parishes, the net demand of the central municipal authority has positively decreased during the six years of the Council's existence.

Apart from these financial complications, which affect rather the distribution of the burden than its total amount, the Council's net demand on the London rate-payer has, in the six years, risen by 1½d. in the pound, everything included. A half penny each for the Parks Committee and the Technical Education Board, a farthing for the Fire Brigade, and another farthing for the growing activities of the Public Health, Asylums, Main Drainage, and other committees—this is the price which London as a whole is asked to pay for the abolition of its old corrupt government, and the substitution of a body which has carried out a beneficent revolution in every department of its municipal life. The net increase of charge upon each Londoner, after six years of the Council's rule, is less than 1d. per month, everything included.

Reference: *The London County Council: What it is and what it Does*, a Fabian tract (1895).

LORIA, ACHILLE, was born at Mantua, Italy, in 1857. He held a professorship first at Sienna, and since then has been at Padua. Cossa places him among the ablest of Italian economists, and says of his views: "In criticising the established order of things economic he goes with the socialists, lavishing upon them

expressions of attachment with a profusion which is quite out of place, and yet he will none of their schemes and remedies, and abides steadfastly in the expectation that the course of nature will heal social wounds by a simple process which is already at work and consists in the 'diffusion' of property and the 'elision' of rent." Among his writings are: *La rendita fondiaria e la sua elisione naturale* (1880); *La legge di popolazione ed il sistema sociale* (1882); *Carlo Darwin e l' economia politica* (1884); *Analisi della proprietà capitalista* (1889, 2 vols.).

LOTTERIES are schemes for the distribution of prizes by lot or chance, usually in return for a consideration.

Lotteries are of Italian origin, the first one being in Florence in 1530. France legalized them in 1539. The first lottery for money was in 1630. The revolutionary governments of France passed laws against them in 1793 and 1830; but they were restored by the Bourbons, and in 1879 12,000,000 national lottery tickets of 1 fr. each were sold in Paris to pay for the Exposition of 1878. Lottery bonds were allowed to be issued in the Panama scandal. In England, the first lottery was one of 40,000 "lots," at 10s. each, in 1569, which was drawn at the west door of St. Paul's Cathedral, the profits of which went for the repairing of the harbor. In 1611-12, in the third charter of Virginia by King James, was a grant to "The Treasurer and Company of Adventurers and Planters of the City of London, for the first Colony of Virginia," of one or more lotteries to run for one year. In England, lotteries were annually licensed from 1709-1823, when they were suppressed.

Sentiment in Europe is, however, against them. J. B. Say declared that the legislators who sanctioned them "vote a certain number of thefts and suicides every year." Yet Prussia, in 1894, realized 10,000,000 thalers from lotteries; Austria,

History. 40,800,000 crowns; Italy, 75,300,000 lire; Spain, 75,000,000 pesetas. In the United States, lotteries were once frequent, and used for raising money, for improving trade, building public edifices, enlarging libraries and colleges (Harvard, Yale, Columbia). They were attacked, however, by Boston clergymen in 1699. They were abolished in Massachusetts and Pennsylvania in 1833 and then in other States. The *Outlook* for March, 1895, gives the following account of the great Louisiana Lottery and its recent defeat:

"It was in 1868 that the company obtained its charter from one of the corrupt carpet-bag legislatures in Louisiana. In 1876, when the white people regained control of the State, they framed a constitution prohibiting lotteries, but United States District Judge Billings promptly ruled that the charter of the lottery company was an inviolable contract, and gave the company the opportunity to negotiate for peace before the Supreme Court had overthrown his infamous decision by declaring that the public morality could not be bartered away by a legislature. At the time of these negotiations the lottery company agreed to retire from the business if allowed to complete the 25-year term fixed by its original charter, and this agreement was accepted. Long before this period expired, however, the lottery had become a great financial institution. It had retained Major-Generals Beauregard and Early to inspect its drawings, and become incom-

parably the most corrupting lottery the country had ever known, because it was the least corrupt. Everybody in the nation had confidence that it conducted its gambling business as it professed to, and the business grew upon a most stupendous scale. Each month it came to issue 28,000,000 tickets at the price of \$1 each, and all that it professed to do was to return to the investors \$14,300,000 of the \$28,000,000 they sent it. . . . It not only contributed generously to campaign funds of parties and individuals, but became incomparably the most philanthropic of all the corporations in Louisiana.

Louisiana Lottery.

When in 1890 it announced to the public its repudiation of its agreement to abandon the business with the expiration of its charter, its philanthropy suddenly increased. At first it offered to raise its contributions to Louisiana taxes from \$40,000 a year to \$500,000, and when the opposition of Governor Nichols made a two-thirds vote necessary, the lottery raised its offer to \$1,250,000 a year, or \$37,000,000 for a new 25-year charter. This bribe was equivalent to \$125 for every voter in the State, yet, as our readers will remember, the patriotism and conscience of Louisiana were so great that the State rejected the offer.

"When, at the end of 1893, the lottery removed its headquarters from New Orleans to Port Tampa, Fla., and Honduras, Central America, it became apparent to all thinking people that the anti-lottery law must be amended. . . ."

"Senator Hoar reported from the Judiciary Committee a new bill for the repression of the lottery traffic. The importation of lottery matter within the United States, and its transportation from State to State by any means whatever, was prohibited by carefully drawn provisions. Meanwhile, . . . the expulsion of the company from Louisiana had little effect. Paul Conrad, the old president of the Louisiana Lottery Company, and also of the Gulf Coast Ice Company, promptly removed his business from New Orleans to Honduras, and continued to advertise to the people of Maine and Manitoba that ice and 'other supplies' could be furnished them from the regions of the equator. When death removed him from his activities in the ice business, another official was promptly secured to take his place, and the programs of so prominent and reputable an institution as the Madison Square Garden, in New York City, were prominently advertising his address and instructing readers to send their orders to him 'by express' in care of — Co., Port Tampa, Fla. There was no legal way in which the business could be checked. . . . Mainly through the efforts of Professor S. H. Woodbridge, of the Boston Institute of Technology, Congress was bombarded with petitions and letters and, finally, telegrams, until the bill which Senator Hoar had safely conducted through the Senate nearly a year ago was, through the vigorous work of Mr. Broderick, of Kansas, accepted by the House of Representatives, two days before adjournment. On the day following it was returned to the Senate for concurrence in certain trivial amendments, and narrowly escaped being throttled by the lottery forces, despite the overwhelming majority professedly in favor of it. . . ."

"Messrs. Brice and Gorman were almost the only men in the Senate who could be brought to the infamy of publicly supporting it. But so shrewdly was this trickery planned and so dexterously was it executed that it failed of success only by a hair's-breadth."

LOVEJOY, ELIJAH PARISH, was born at Albion, Me., in 1802. After studying theology at Princeton, he was ordained a Presbyterian minister in 1833, and became editor of the *St. Louis Observer*, a religious paper. While disclaiming any connection with the abolitionists, he nevertheless wrote sympathetically of the anti-slavery agitation, which was then beginning. This greatly offended many of the citizens, and the feeling against him increased in bitterness, until finally the office of the *Observer* was destroyed by a mob. He then resolved to remove his paper to Alton, Ill., but as soon as his press was brought there a mob broke it into fragments. The town reimbursed him for his loss, and another press was procured, only to be destroyed by the mob. He bought

a third press, but it met the same fate. By this time the question had become serious. A convention comprising many of the noblest men in Illinois was held at Upper Alton. It supported him and bought another press, which arrived November 7, 1837. At midnight a mob of 30 or 40 men came from the neighboring drink-shops and commenced to throw stones at the warehouse, to fire shots, and at last attempted to burn it. The roof being set on fire, Mr. Lovejoy and several others stepped out and were fired upon by the rioters. One of the bullets struck Mr. Lovejoy, who only lived long enough to return to the warehouse.

LOYAL WOMEN OF AMERICAN LIBERTY.—The National Association of Loyal Women of American Liberty is an organization of Christian women having for their special work the exercise of their influence, by lectures and otherwise, as opportunity offers, toward urging legislation to a limitation of immigration, the absolute separation of Church and State in all matters pertaining to taxation and education, compulsory education, and retention of the Bible in public schools. The motto of the order is "For God and American Liberty." Any woman who will promise to work for the increase of God's kingdom and for the furtherance of American liberties may become a member.

LUDLOW, JOHN MALCOLM, was an English lawyer associated with Maurice and Kingsley in their Christian Socialism, and to a degree the originator of the movement. A letter of his to Maurice, written from Paris in 1848, and describing the French socialist movement of that period, seems first to have directly turned Maurice's thoughts in the direction of Christian Socialism. Ludlow was associated with Maurice and Kingsley in the weekly paper, *Politics for the People*, and in 1850 he became editor of the *Christian Socialist*, which became in 1851 the *Journal of Association*. He also wrote for the series *Tracts by Christian Socialists*. Among those who started in 1850 the first association of cooperative working tailors Ludlow was prominent, and he was one of the convening committee of the first cooperative congress in London, in 1860, together with Kingsley, Hughes, and Neale. He has since that date taken little prominent part in social reform, but has written able articles on the early Christian Socialists in the *Economic Review* (October, 1893) and the *Atlantic Monthly* (January, 1896).

LUXURY, says Professor Émile de Laveleye, "consists in the consumption of what has cost great labor to produce, for the satisfaction of spurious needs." So defining it, he condemns it, and says: "Luxury is pernicious to the individual and fatal to society. Primitive Christianity reprobated it in the name of charity and humility; political economy condemns it in the name of utility, and justice condemns it in the name of equity."

Professor R. T. Ely writes in a symposium on *Luxury* in the *Kingdom* (June 5, 1896):

"A newspaper writer, speaking of certain extravagant social events which occurred a few years since, used these words: 'Murmurs against luxury may be

heard among people in straitened circumstances when the lavish expenditures and sumptuous pleasures of great society entertainments are discussed. But such persons are prone to forget that these expenditures that seem so prodigal go in large part to benefit the working people. We cannot consider now all the economic fallacies involved in arguments of this kind. They have been exposed over and over again by able men. It may, however, simply be pointed out that the same expenditure made in behalf of others would give equal employment to labor. Let us take the case of a man who contributes \$1,000,000 for a public building, and contrast it with the case of a man who spends \$1,000,000 on his own private house. Labor has equal employment in both cases, but the benefit of the toil accrues to the public in the one case and in the other to the selfish enjoyment of an individual. Another comparison: Contrast the expenditure of \$10,000 for an evening's entertainment with an expenditure of \$10,000 for books for a public library. Labor is alike employed in both cases, but in the second case the enjoyment is more widely diffused and is of a far more enduring character. This attempted justification is precisely on a line with that which people advance for the maintenance of gambling dens and the support of the traffic in intoxicating beverages."

LYNCHING.—The word is derived from the phrase Lynch's law, Charles Lynch (1736-96) being a Virginia planter and originally a Quaker, who in the early days of the American Revolution undertook to protect society and support the revolutionary government by punishing with stripes or banishment (not death) accused enemies of the public. The word is used today of summary punishment, and especially of death, without legal authority. According to a table kept by the Chicago *Tribune*, there were in the United States from 1886 to November, 1895, 1030 legal executions and 1655 lynchings, mainly in the South. In South Carolina, in case of lynching to death, the county has recently been made liable for \$2000, with a remedy over against the parties concerned and the dismissal of faulty officers. (See **HOMICIDES.**)

M.

MABLY, GABRIEL BONNOT DE, was born at Grenoble in 1709. After having pursued his studies with the Jesuits of Lyons, he entered the seminary of St. Sulpice, but later became secretary to his relative, the cardinal of Teucin, minister of foreign affairs. The true minister was Mably. At last, however, a misunderstanding arose between the minister and his secretary, and Mably withdrew to devote himself to political science. Already in 1742 his *Parallèle des Romains et des Français par rapport au gouvernement* had established his fame. In 1748 appeared the *Droit public de l'Europe fondé sur les traités*; afterward the *Entretiens de Phocion sur le rapport de la morale avec la politique* (1763); *Doutes proposés aux philosophes économistes sur l'ordre naturel des sociétés* (1768); *De la législation, ou Principes des lois* (1770); *Observations sur le gouvernement et les lois des États-Unis d'Amérique* (1784)—a curious work, in which he predicts the approaching downfall of the new republic "unless it turn away from the line of commercialism in which it is involved." Invited by the Polish Diet to prepare a code of laws for Poland, his *Gouvernement de Pologne* appeared in 1781.

Mably died in 1785, not without foreseeing the Revolution which would be accomplished. Besides the works already mentioned, he was the author of numerous historical and philosophical books; several posthumous works were also published, among them *Les Droits et les Devoirs du Citoyen*.

The economic ideas of Mably are scattered through all his works; they form a complete system and make him one of the first thinkers of his age. In early life he professed views which he later outgrew. In his *Parallèle des Romains et des Français* (which he afterward repented having written) he stoutly defended an absolute monarchy; he extolled luxury, and considered the arts, industry, and commerce as actual benefits to men.

MACHIAVELLI, NICCOLÒ DI BERNARDO, was born in Florence in 1469, of middle-class parentage. A man of affairs rather than a student, he grew up in the brilliant court of Lorenzo the Magnificent, and after the reestablishment of the republic in 1498 he was, till the return of the Medici in 1512, chancellor or secretary of the second chancery in Florence, thrown intimately with public men, and sent on repeated embassies to Cesare Borgia, Pope Julius II., the Emperor Maximilian, Louis XII. of France, and the various Italian States. The return of the Medici ended his public career, tho he sought favor with them, and in 1521 was commissioned by them to write a history of Florence; but in 1527 the Medici were again driven from Florence, and Machiavelli died in disappointment the same year. His fame rests upon his writings. He wrote a few comedies and some verse, all poor except *La Mandragola*, an immoral play, but by some considered a masterpiece. His prose, however, was as good as his verse was bad. Some consider him the greatest writer of Italian prose. He throws aside the traditions of style and thoughts both of the classic age and the Middle Ages which he despised, and writes as a man of the world.

His political writings have made his reputation. *Dell'arte della guerra* (1520) advocates the present system of standing armies instead of the Middle Age use of mercenaries. His *Lettere familiari* and *Istorie Fiorentine* (1525) give unrivaled insight into his times. His *Discorsi sopra la prima deca di Tito Livio* gives his ideas of republican government; but his great work is *Il Principe*, in which he considers absolute monarchy, and has made the word *machiavellism* a synonym for evil. There has been interminable discussion whether Machiavelli wrote this book satirically, cynically, immorally, or honestly. It is a remorseless and scientific examination of the principles and methods an absolute monarch as a matter of fact follows and seemingly must follow in order

to succeed. All factors of rights and morals are eliminated. Every point is proved and illustrated from contemporary history. Some of his principles need a Cesare Borgia to execute. Like the *Discorsi*, it was published after his death in 1532. (See POLITICAL SCIENCE.) Machiavelli was undoubtedly a man of the world, but he always seems to have been true to Florence, and to have had a true, devoted wife in Marietta Corsini.

MACHINERY.—The importance of machinery in production can scarcely be overestimated. The part that it has played in the development of the modern labor problem can scarcely be put too strong. We shall consider, I. The Facts of Machine Production; II. Social Results; III. The Right Use of Machinery.

I. THE FACTS OF MACHINE PRODUCTION.

Tools and machinery are not identical; a tool is an instrument, usually simple, tho, as in the case of the lathe and potter's wheel, sometimes complex, which is guided and directed by the skill of the craftsman. When the tool grows complex, and is not guided by the individual skill of the craftsman, but by a mechanism which governs its action, it is called a machine. Machinery usually includes motor mechanism transmitting mechanism and working or tool mechanism.

Machinery increases man's productivity in two ways. It enables him, as with the steam hammer, to concentrate enormous power upon a fixed point, and to make motion regular and continuous. Says Mr. J. A. Hobson (*The Evolution of Modern Capitalism*, pp. 51, 52):

"Machinery can increase the scope of man's productive ability in two ways: The difficulty of concentrating a large mass of human force upon a given point at the same time provides certain quantitative limits to the productive efficiency of the human body. The steam-hammer can perform certain work which is quantitatively outside the limit of the physical power of any number of men working with simple tools and drawing their motor power from their own bodies. The other limit to the productive power of man arises from the imperfect continuity of human effort and the imperfect command of its direction. . . . Machinery can also do work which is too fine or delicate for human fingers, or which would require abnormal skill if executed by hand. . . ."

Use.

"The continuity and regularity of machine work are also reflected in certain economies of measurement. The faculty of self-registering, which belongs potentially to all machinery, and which is more utilized every day, performs several services which may be summed up by saying that they enable us to know exactly what is going on. When to self-registration is applied the faculty of self-regulation, within certain limits a new economy of force and knowledge is added. But machinery can also register and regulate the expenditure of human power. Babbage well says: 'One of the most singular advantages we derive from machinery is in the check which it affords against the inattention, the idleness, or the knavery of human agents.' . . ."

"These are the sources of all the improvements of economies imputed to machine production. All improvements in machinery, as applied to industrial arts, take therefore one of the following forms:

"(1) Rearrangement or improvement of machinery so as to utilize more fully the productive power of nature or man. Improvements enabling one man to tend more spindles, or enabling the same engine at the same boiler pressure to turn more wheels, belong to this order of improvement.

"(2) Economies in the source of power. These will fall under four heads: 1. Substitution of cheaper for dearer kinds of human power. Displacement of men's

labor by women's or children's. 2. Substitution of mechanical power for human power. Most great improvements in the 'labor-saving' character of machinery properly come under this head. 3. Economies in fuel or in steam. The most momentous illustration is the adoption of the hot blast and the substitution of raw coal for coke in the iron trade. 4. The substitution of a new mechanical motor for an old one derived from the same or from different stores of energy—*e.g.*, steam for water power, natural gas for steam.

"(3) Extended application of machinery. New industrial arts owing their origin to scientific inventions and their practice to machinery arise for utilizing waste products. Under 'waste products' we may include (a) natural materials, the services of which were not recognized or could not be utilized without machinery—*e.g.*, nitrates and other 'waste' products of the soil; (b) the refuse of manufacturing processes which figured as 'waste' until some unsuspected use was found for it."

The development of machinery may be divided into four periods:

1. The period of the earlier mechanical inventions, marking the displacement of domestic by factory industry (1764-85).

2. The period of application of steam to manufacturing (1785-1814).

3. The period of steam locomotion, with its bearing on industry (1814-56).

4. The period of the construction of machinery by machinery (1856-66).

Important dates in the development of machinery are the invention of Hargreave's spinning jenny (1764), Arkwright's mill (1771), Crompton's mule (1779), Cartwright's power loom and Watt's engine for cotton mills (1785), Whitney's cotton gin (1792), Stephenson's locomotive (1814), the opening of the first railway (1822), the hot blast (1829), ring spinning (1841). The revolution in the industrial world created by machinery has been often dwelt upon. The following facts are taken from the first annual report of the United States Commissioner of Labor Statistics in Washington for 1886:

The commissioner, inquiring into the industrial crisis, finds that it is mainly due to the immense development of machine industry under the joint-stock system; and he takes up various trades one after another to show how labor has been displaced by machinery. In the timber business, he says, 12 laborers with a Bucker machine will dress 22,000 staves. The same number of men by hand labor would have dressed in the same time only 2500. In the manufacture of paper a machine now used for drying and cutting, run by four men and six girls, will do the work formerly done by 100 persons, and do it much better. In the manufacture of wall-paper the best evidence puts the displacement in the proportion of 100 to 1. In a phosphate mine in South Carolina 10 men accomplish with machinery what 100 men handle without it in the same time. There has been a displacement of 50 per cent. in the manufacture of rubber boots and shoes. In South Carolina pottery the product is ten times greater by machine processes than by muscular labor. In the manufacture of saws, experienced men consider that there has been a displacement of three men out of five. In the weaving of silk the displacement has been 35 per cent., and in the winding of silk 90 per cent. A large soap manufacturing concern carefully estimates the displacement of labor in its works at 50 per cent. In making wine in California a crushing machine has been introduced with which one man can crush and stem 80 tons of grapes in a day, representing an amount of work formerly requiring eight men. In woollen goods modern machinery has reduced muscular labor 33 per cent. in the carding department, 50 per cent. in the spinning, and 25 per cent. in the weaving. In some kinds of spinning 100 to 1 represents the displacement. In the whole United States in 1886 the machinery was equal to 3,500,000 horse-power. If men only had been employed, it would have required 21,000,000 to turn out the actual total product; the real number was 4,000,000. To do the work accomplished in 1886 in the United States by

power machinery and on the railways would have required men representing a population of 172,500,000. The actual population of the United States in 1886 was something under 60,000,000, or a little more than one third.

"Commenting on these very remarkable statistics, the Labor Commissioner says: 'The apparent evils resulting from the introduction of machinery and the consequent subdivision of labor have to a large extent, of course, been offset by advantages gained; but it must stand as a positive statement, which cannot be successfully controverted, that this wonderful introduction and extension of power machinery is one of the prime causes, if not the prime cause of the novel industrial condition in which the manufacturing nations find themselves.'"

Machinery, too, has revolutionized agriculture. Mr. D. A. Wells considers it to have made greater changes here than in any other occupation. He says (*Recent Economic Changes*):

"In respect to no other one article has change in the conditions of production and distribution been productive of such momentous consequences as in the case of wheat. On the great wheat fields of the State of Dakota, where machinery is applied to agriculture to such an extent that the requirement for manual labor has been reduced to a minimum, the annual product of one man's labor, working to the best advantage, is understood to be now equivalent to the production of 5500 bush. of wheat. In the great mills of Minnesota, the labor of another one man for a year, under similar conditions as regards machinery, is in like manner equivalent to the conversion of this unit of 5500 bush. of wheat into 1000 bbls. of flour, leaving 500 bush. for seed purposes; and altho the conditions for analysis

Agriculture. of the next step in the way of results are more difficult, it is reasonably certain that the year's labor of one and a half men more—or, at the most, two men—employed in railroad transportation, is equivalent to putting this 1000 barrels of flour on a dock in New York ready for exportation, where the addition of a fraction of a cent a pound to the price will further transport and deliver it at almost any port of Europe.

"Here, then, we have the labor of three men for one year, working with machinery, resulting in the producing all the flour that 1000 other men ordinarily eat in a year, allowing one barrel of flour for the average consumption of each adult. Before such a result the question of wages paid in the different branches of flour production and transportation becomes an insignificant factor in determining a market; and, accordingly, American flour grown in Dakota and ground in Minneapolis, from 1000 to 1500 miles from the nearest seaboard, and under the auspices of men paid from \$1.50 to \$2.50 per day for their labor, is sold in European markets at rates which are determinative of the prices which Russian peasants, Egyptian 'fellahs,' and Indian 'ryots,' can obtain in the same markets for similar grain." (See AGRICULTURE.)

Mr. Hobson says (as above):

"It must not be forgotten that by far the most important factor in the decline of English agricultural employment is the transport machinery which has brought the produce of distant countries into direct competition with English agricultural produce."

Of England, Mr. William Clarke, in the *Fabian Essays*, says:

"A cotton-mill in one of the dismal 'hell-holes' called towns in Lancashire is a wonderful place, full of bewildering machines. Here is a machine called an 'opener,' by which 15,000 lbs. of cotton can be opened in 56 hours. There is a throstle, the spindles of which make from 6000 to 7000 revolutions per minute. Here is a man who, with the aid of two pieces to take up and join the broken ends, can work 2000 spindles. Among the distinct separate machines used are opener, scutcher, and lap machine, drawing frame, stubbing frame, intermediate frame, roving frame, throstle, self-acting mule and hand mule, doubling frame, and mule doublers or twiners. By means of these appliances the following results have been attained. Within eight years, from 1792 to 1800, the quantity of cotton exported from the United States to Lancashire had increased from 138,000 lbs. to 18,000,000 lbs. In 1801 Lancashire

took 84,000 bales of cotton from the United States; in 1876 she took 2,075,000 bales; and whereas in the former year only 14,000 bales came from India, in 1876 from that country came 775,000 bales, besides a great increase in Brazilian cotton and a new import of 332,000 bales from England.

In 1805, 1,000,000 pieces of calico were sold in the Blackburn market during the whole year; and that was considered a very large sale. In 1884, according to Ellison's *Annual Review of the Cotton Trade*, there were exported 4,417,000 yards of piece goods, besides the vast quantity produced for home consumption. In 1875, in place of the little cottages with their hand-looms of a century before, Lancashire contained 2655 cotton factories with 37,515,772 spinning spindles and 463,118 power looms; and she produced yarn and piece goods to the weight of 1,088,890,000 lbs., and of the value of £95,447,000. See too how through the use of machinery the cost of production had been lowered. In 1790 the price of spinning the yarn known technically as No. 100 was 4s. per lb.; in 1826 it had been reduced to 63d. The sale price of yarn No. 100 in 1786 was 38s.; in 1793 it was reduced to 25s. 1d.; in 1802 to 8s. 4d.; in 1876 to 28s. 6d. The decreased cost in each case followed on economy in production, itself dependent on increased differentiation in machinery; that in turn involving larger and larger capital; and that again necessitating aggregation and the crushing out of small concerns which could not command machinery or sell at a profit in competition with it."

And this process is by no means an ended one. Mr. Carroll D. Wright, in his *Industrial Evolution of the United States*, chap. xxvii., gives some instances of very recent improvements in machinery. He says (abridged):

"One of the latest sextuple stereotype perfecting presses manufactured by R. Hoe & Co., of New York, has an aggregate running capacity of 72,000 eight-page papers per hour; that is to say, one of these perfected presses, run by one pressman and four skilled laborers, will print, cut at the top, fold, paste, and count (with supplement inserted if desired) 72,000 eight-page papers in one hour. To do the press-work alone for this number of papers would take, on the old plan, a man and a boy, working 10 hours per day, 100 days. By the use of Goodyear's sewing-machine for turned shoes one man will sew 250 pairs in one day. It would require eight men, working by hand, to sew the same number in the same time. By the use of a heel-shaver or trimmer one man will trim 300 pairs of shoes a day, while formerly three men would have been required to do the same work; and with the McKay machine one operator will handle 300 pairs of shoes in one day, while without the machine he could handle but five pairs in the same time. So, in nailing on heels, one man, with the aid of machinery, can heel 300 pairs of shoes per day. In the days of the single-spindle hand-wheel, one spinner, working 56 hours continuously, could spin five hanks of No. 32 twist. At the present time, with one pair of self-acting mule-spinning machines, having 2124 spindles, one spinner, with the assistance of two small boys, can produce 55,008 hanks of No. 32 twist in the same time. . . . Even in power machinery, a weaver formerly tended but one loom. Now one weaver minds all the way from 2 to 10 looms according to the grade of goods. . . . In a large establishment in New Hampshire, improved machinery, even within 10 years, has reduced muscular labor 50 per cent in the production of the same quality of goods. In weaving, in the olden time, in this country, a fair adult hand-loom weaver wove from 42 to 48 yards of common shirting per week. Now a weaver, tending six power-looms in a cotton factory, will produce 1500 yards and over in a single week; and now a recent invention will enable a weaver to double this product."

In many lines of manufactures new machinery has to be put in every few years to keep up with the competition. Steamers 10 years old are usually worthless for fast voyages.

In his *Recent Economic Changes*, chap. ii., Mr. D. A. Wells says:

"The power capable of being exerted by the steam-engines of the world in existence and working in the year 1887 has been estimated by the Bureau of Statistics at Berlin as equivalent to that of 200,000,000

horses, representing approximately 1,000,000,000 men; or at least three times the working population of the earth, whose total number of inhabitants is probably about 1,460,000,000. The application and use of steam alone up to date (1889) has accordingly more than trebled man's working power, and by enabling him to economize his physical strength has given him greater leisure, comfort, and abundance, and also greater opportunity for that mental training which is essential to a higher development. And yet it is certain that four fifths of the steam-engines now working in the world have been constructed during the last quarter of a century, or since 1865."

But the present steam-engine will probably be discarded. Says Mr. Wells:

"Notwithstanding the immense service which the steam-engine has rendered to humanity, and its present continuing necessity as a prime factor in all civilization, it is at the same time certain that as a machine it is most imperfect, inasmuch as the very best steam-engines only utilize about one sixth of the power (work) which resides in the fuel which is consumed in the generation of steam. The entire displacement of the steam engine as it now exists is, therefore, not only essential to further great material progress, but is confidently expected to happen at no very distant period by those eminently qualified to express an opinion on this subject. Thus, at the meeting of the British Association for the Advancement of Science in 1888, the president, Sir Frederick Bramwell, after expressing his belief that the days of the steam-engine for small powers were already numbered, further predicted that those who should attend the centenary of the Association in 1931 'would see the present steam-engines in museums, treated as things to be respected and of antiquarian interest, by the engineers of those days, such as are the open-topped steam cylinders of Newcomen and of Smeaton to ourselves, and that the heat-engine of the future will probably be one independent of the vapor of water.' Indeed, 'the working of heat-engines, without the intervention of the vapor of water by the combustion of the gases arising from coal, or from coal and from water,' he continued, 'is now not merely an established fact, but a recognized and undoubted commercially economical means of obtaining motive power. Such engines, developing from 1 to 40 horse-power, and worked by ordinary gas supplied by gas-mains, are in most extensive use in printing works, hotels, clubs, theaters, and even in large private houses, for the working of dynamos to supply electric light. But looking at the wonderful petroleum industry, and at the multifarious products which are obtained from the crude material, is it too much to say that there is a future for motor-engines worked by the vapor of some of the more highly volatile of these products—true vapor—not a gas, but a condensable body capable of being worked over and over again? Numbers of such engines, some of as much as four horse-power, are now running, and are apparently giving good results—certainly excellent results as regards the compactness and lightness of the machinery."

The Future.

water by the combustion of the gases arising from coal, or from coal and from water,' he continued, 'is now not merely an established fact, but a recognized and undoubted commercially economical means of obtaining motive power. Such engines, developing from 1 to 40 horse-power, and worked by ordinary gas supplied by gas-mains, are in most extensive use in printing works, hotels, clubs, theaters, and even in large private houses, for the working of dynamos to supply electric light. But looking at the wonderful petroleum industry, and at the multifarious products which are obtained from the crude material, is it too much to say that there is a future for motor-engines worked by the vapor of some of the more highly volatile of these products—true vapor—not a gas, but a condensable body capable of being worked over and over again? Numbers of such engines, some of as much as four horse-power, are now running, and are apparently giving good results—certainly excellent results as regards the compactness and lightness of the machinery."

Many believe that the use of electricity as a motor power will still more revolutionize industry. (See ELECTRICITY. For further illustrations of the productive power of machinery, see PRODUCTIVITY.)

II. SOCIAL RESULTS.

In his *Political Economy*, Book IV., chap. vi., John Stuart Mill wrote his oft-quoted words: "Hitherto it is questionable if all the mechanical inventions yet made have lengthened the day's toil of any human being." This is considered by many an exaggeration. If hours of labor were at first lengthened by the introduction of machinery, they are to-day steadily being lessened. (See SHORT-HOUR MOVEMENT.) If machinery has developed the factory system, that to-day is by no means what it was. (See FACTORY SYSTEM.) The most evil results of machinery are thus temporary, its good results per-

manent. Realizing what machinery means in the way of cheapened production and how it makes it possible that wage-owners should own a hundred commodities that the wealthy could not have a hundred years ago, most economists believe that machinery has been to the vast benefit of working men as of all classes. There are, however, two sides to this. The most serious discussion has been on the question of how far machinery has permanently displaced labor. Writers like Mr. Carroll D. Wright claim that if machinery has displaced labor in one direction it has created more employment for them in others. Mr. Wright shows, e.g., in his *Industrial Evolution of the United States*, chap. xxviii., that the per capita of cotton consumption of cotton in this country was 5.9 lbs. in 1830, 13.91 lbs. in 1880, and 19 lbs. in 1890, which figures he says "clearly and positively indicate that the labor necessary for such consumption has been kept up to the standard, if not beyond the standard, of the olden time—that is, as to the number of people employed." In iron he says the increase has been as great proportionally: 105.64 lbs. in 1870, 204.90 lbs. in 1880, and 283.38 lbs. in 1890. In steel it was 46 lbs. in 1880 and 144 in 1890. Many occupations have been created. He says (we abridge his words):

"If we could examine scientifically the number of created occupations, the claim that inventions have displaced labor on the whole would be conclusively and emphatically refuted. In telegraphy thousands and thousands of people are employed where no one has ever been displaced. Electroplating, a modern device, has not only added wonderfully to the employed list by its direct influence, but indirectly by the introduction of a class of goods which can be secured by all persons.

"The railroads offer another grand illustration of the expansion of labor. It now requires more than three quarters of a million of people to operate our railroads, and this means a population of nearly four millions, or one sixteenth of the whole population of the country. The displacement of the stage-coach and the stage-driver was nothing compared to the expansion of labor which the railroad systems of the country have created. As a means of expansion of labor the sewing machine is a striking illustration. It has displaced no one; it has increased demand, and it has been the means of establishing great workshops to supply the thousands of machines that are sold throughout the world.

"The expansion of values as the result of the influence of machinery has been quite as marvelous as in any other direction, for educated labor, supplemented by machinery, has developed small quantities of inexpensive material into products of great value. This truth is illustrated by taking cotton and iron ore as the starting-point. A pound of cotton, costing at the time this calculation was made but 13 cents, has been developed into muslin which sold in the market for 80 cents, and into chintz which sold for \$4. Seventy-five cents' worth of common iron ore has been developed into \$5 worth of bar iron, or into \$10 worth of horseshoes, or into \$180 worth of table knives, or into \$6800 worth of fine needles, or into \$29,480 worth of shirt-buttons, or \$200,000 worth of watch-springs, or \$400,000 worth of hair-springs, and the same quantity of common iron ore can be made into \$2,500,000 worth of pallet arbors.

"The illustrations given, both of the expansion of labor and the expansion of values, are sufficiently suggestive of a line of study which, carried in any direction, will show that machinery is the friend and not the enemy of man, especially when man is considered as a part of society and not as an individual."

Mr. Hobson, however, who has made a more minute analysis, comes to less pronounced results. He says (as above, pp. 234, 235):

"Facts and figures seem to support the following conclusions:

Creates Work.

"1. That along with the increased application of machinery to the textile and other staple manufactures there has been in these industries a decrease of employment relative to the growth of the working population.

"2. That in the transport industries the increase of employment is in inverse proportion to the introduction of machinery into the several branches as a dominating factor.

"3. That the considerable diminution of agricultural employment is not compensated by any proportionate increase of manufacturing employment, but that the displaced agricultural labor finds employment in such branches of the transport and distributive trade as are less subject to machinery. . . .

"So far, therefore, as the statistics of employments present a just register of the influence of machinery upon demand for labor, we are driven to conclude that the net influence of machinery is to diminish employment so far as those industries are concerned into which

Effect on Employment. machinery directly enters, and to increase the demand in those industries which machinery affects but slightly or indirectly. If this is true of England, which, having the start in the development of the factory system, has to a larger extent than any other country specialized in the arts of manufacture, it is probable that the net effect of machinery upon the demand for labor throughout the industrial world has been to throw a larger proportion of the population into industries where machinery does not directly enter."

Machinery has, too, Mr. Hobson argues, a greater effect in increasing the irregularity of employment. He says :

"While it is the interest of each producer of machine-made goods to give regular employment, some wider industrial force compels him to irregularity. What is this force? It is uncontrolled machinery. In the several units of machine production, the individual factories or mills, we have admirable order and accurate adjustment of parts ; in the aggregate of machine production we have no organization, but a chaos of haphazard speculation. 'Industry has not yet adapted itself to the changes in the environment produced by machinery.' That is all. . . .

"When production was slower, markets narrower, credit less developed, there was less danger of this big miscalculation, and the corrective forces of industry were more speedily effective. But modern machinery has enormously expanded the size of markets, the scale of competition, the complexity of demand, and production is no longer for a small, local, present demand, but for a large, world, future demand. Hence machinery is the direct material cause of these great fluctuations which bring, as their most evil consequence, irregularity of wages and employment.

"How far does this tend to right itself? Professor Nicholson believes that time will compel a better adjustment between machinery and its environment.

"The enormous development of steam communication and the spread of the telegraph over the whole globe have caused modern industry to develop from a gigantic star-fish, any of whose members might be destroyed without affecting the rest, into a μέγα ζώον which is convulsed in agony by a slight injury in one part. A depression of trade is now felt as keenly in America and even in our colonies as it is here. Still, in the process of time, with the increase of organization and decrease of unsound speculation, this extension of the market must lead to greater stability of prices ; but at present the disturbing forces often outweigh altogether the supposed principal elements."

"The organization of capital under the pressure of these forces is doubtless proceeding, and such organization, when it has proceeded far enough, will indisputably lead to a decrease of unsound speculation. But these steps in organization have been taken precisely in those industries which employ large quantities of fixed capital, and the admitted fact that severe fluctuations still take place in these industries is proof that the steadying influences of such organization have not yet had time to assert themselves to much purpose. The competition of larger and larger masses of organized capital seems to induce heavier speculation and larger fluctuations. Not until a whole species of capital is organized into some form or degree of 'combination' is the steadying influence of organization able to predominate.

"But there is also another force which, in England, at any rate, under the increased application of machinery, makes for an increase rather than a diminution of

speculative production. It has been seen that the proportion of workers engaged in producing comforts and luxuries is growing, while the proportion of those producing the prime necessities of life is declining. How far the operation of the law of diminishing returns will allow this tendency to proceed we cannot here discuss. But statistics show that this is the present tendency both in England and in the United States. . . .

"So long, then, as a community grows in numbers, so long as individuals desire to satisfy more fully their present wants and continue to develop new wants, forming a higher or more intricate standard of consumption, there is no evidence to justify the conclusion that machinery has the effect of causing a net diminution in demand for labor, tho it tends to diminish the proportion of employment in the 'manufacturing' industries ; but there is strong reason to believe that it tends to make employment more unstable, more precarious of tenure, and more fluctuating in market value."

See also OCCUPATIONS ; UNEMPLOYMENT.

Less discussed but perhaps more important is the effect of machinery upon the *quality* of labor. Some believe that machinery improves labor, taking it out of tenements and rude huts into factories, which are now usually comparatively hygienic (for proof see article, SWEATING, where it is shown how terrible are the conditions in trades not using machinery). Others argue, too, that machinery replaces muscular labor by higher forms of labor. Professor Marshall inclines to this view (*Principles of Economics*, 2d ed., pp. 314, 322). Others dwell upon the educative effect of machinery, teaching inventiveness, love of order, cooperation, etc. But there is another side to the question. Says Mr. Hobson (as above, chap. ix.) :

"As regards those workers who pass from ordinary manual work to the tending of machinery, there is a good deal of evidence to show that, in the typical machine industries, their new work taxes their physical vigor quite as severely as the old work. Professor Shield Nicholson quotes the following striking statement from the *Cotton Factory Times*: 'It is quite a common occurrence to hear young men who are on the best side of 30 years of age declare they are so worked up with the long mules, coarse counts, quick speeds, and inferior material, that they are fit for nothing at night, only going to bed and taking as much rest as circumstances will allow. There are few people who will credit such statements; nevertheless they are true, and can be verified any day in the great majority of the mills in the spinning districts.'

"Schulze-Gaevernitz shows that the tendency in modern cotton-spinning and weaving, especially in England, has been both to increase the number of spindles and looms which an operative is called upon to tend, and to increase the speed of spinning. 'A worker tends to-day more than twice or nearly three times as much machinery as his father did ; the number of machines in use has increased more than fivefold since that time, while the workers have not quite doubled their numbers.' With regard to speed, 'since the beginning of the seventies the speed of the spinning machines alone has increased about 15 per cent.' (*Der Grossbetrieb*, pp. 120-157) 'There is a temptation,' as Mr. Cunningham says, 'to treat the machine as the main element in production, and to make it the measure of what a man ought to do, instead of regarding the man as the first consideration, and the machine as the instrument which helps him ; the machine may be made the primary consideration, and the man may be treated as a mere slave who tends it' (*Uses and Abuses of Money*, p. 111)

"The factory is organized with military precision, the individual's work is definitely fixed for him ; he has nothing to say as to the plan of his work or its final completion or its ultimate use. 'The constant employment on one sixty-fourth part of a shoe not only offers no encouragement to mental activity, but dulls by its monotony the brains of the employee to such an extent that the power to think and reason is almost lost' (*Contemporary Review*, 1889, p. 392).

"Dr. Arlidge expresses a decided opinion : 'Generally speaking, it may be asserted of machinery that it calls for little or no brain exertion on the part of those connected with its operations ; it arouses no interest,

and has nothing in it to quicken or brighten the intelligence, tho it may sharpen the sight and stimulate muscular activity in some one limited direction' (*Diseases of Occupations*, pp. 25, 26).

"A locomotive superintendent of a railway was recently questioned as to the quality of engine-driving. 'After 20 years' experience he declared emphatically that the very best engine-drivers were those who were most mechanical and unintelligent in their work, who cared least about the internal mechanism of the engine.' Yet engine-driving is far less mechanical and monotonous than ordinary tending of machinery."

Effect on Character.

Mr. Hobson concludes :

"The net influence of machinery upon the quality of labor, then, is found to differ widely according to the relation which subsists between the worker and the machine. Its educative influence, intellectual and moral, upon those concerned with the invention, management, and direction of machine industry, and upon all whose work is about machinery, but who are not detailed machine-tenders, is of a distinctly elevating character. Its effect, however, upon machine-tenders in cases where, by the duration of the working day or the intensity of the physical effort, it exhausts the productive energy of the worker, is to depress vitality and lower him in the scale of humanity by an excessive habit of conformity to the automatic movements of a non-human motor. This human injury is not adequately compensated by the education in routine and regularity which it confers, or by the slight understanding of the large co-operative purposes and methods of machine industry which his position enables him to acquire."

Machinery is, too, the creator of the factory system and the factory town. (See FACTORY SYSTEM.) It is this, perhaps, which makes it most unpopular with the worker. Says Mr. Robert Blatchford (*Merrie England*, chap. iii.) :

"My reasons for attacking the factory system are :

- "1. Because it is ugly, disagreeable, and mechanical.
- "2. Because it is injurious to public health.
- "3. Because it is unnecessary.
- "4. Because it is a danger to the national existence.

"The Manchester school will tell you that the destiny of this country is to become 'the workshop of the world.'"

"I say that is not true; and that it would be a thing to deplore if it were true. The idea that this country is to be the 'work-shop of the world' is a wilder dream than any that the wildest socialist ever cherished. But if this country did become the 'work-shop of the world,' it would at the same time become the most horrible and the most miserable country the world has ever known.

"Let us be practical, and look at the facts.

"First, as to the question of beauty and pleasantness. You know the factory districts of Lancashire. I ask you is it not true that they are ugly, and dirty, and smoky, and disagreeable? Compare the busy towns of Lancashire, of Staffordshire, of Durham, and of South Wales, with the country towns of Surrey, Suffolk, and Hants. . . .

"I know that the Manchester school will tell you that this is mere 'sentiment.' But compare their actions with their words: . . .

"To make wealth for themselves they destroy the beauty and the health of your dwelling-places; and then they sit in their suburban villas, or on the hills and terraces of the lovely southern countries, and sneer at the 'sentimentality' of the men who ask you to cherish beauty and to prize health.

"Or they point out to you the value of the 'wages' which the factory system brings you, reminding you that you have carpets on your floors, and pianos in your parlors, and a week's holiday at Blackpool once a year.

"But how much health or pleasure can you get out of a cheap and vulgar carpet? And what is the use of a piano if you have neither leisure nor means to learn to play it? And why should you prize that one week in the crowded, noisy watering-place, if health and fresh air and the great salt sea are mere sentimental follies?"

III. THE RIGHT USE OF MACHINERY.

Some writers, like John Ruskin, imply, if they do not state, that there is no right use of

machinery. They say that it must destroy art and life and beauty. (See ART.) Ruskin says in *Fors Clavigera* :

"A man and a woman, with their children, properly trained, are able easily to cultivate as much ground as will feed them; to build as much wall and roof as will lodge them, and to spin and weave as much cloth as will clothe them. They can all be perfectly happy and healthy in doing this. Supposing that they invent machinery which will build, plow, thresh, cook, and weave, and that they have none of these things any more to do, but may read, or cricket, all day long, I believe myself that they will neither be so good nor so happy as without the machines. . . . No machines will increase the possibilities of idleness. They only increase the possibilities of idleness. . . . There was a rocky valley between Buxton and Bakewell, once upon a time, divine as the Vale of Tempe; you might have seen the gods there morning and evening—Apollo and all the sweet muses of the Light—walking in fair procession on the lawns of it, and to and fro among the pinnacles of its crags. You cared neither for gods nor grass, but for cash (which you did not know the way to get); you thought you could get it by what the *Times* calls 'Railroad Enterprise.' You enterprised a railroad through the valley—you blasted its rocks away, heaped thousands of tons of shale into its lovely stream. The valley is gone, and the gods with it; and now, every fool in Buxton can be at Bakewell in half an hour, and every fool in Bakewell at Buxton; which you think a lucrative process of exchange."

Wiser, however, seems the position of those who believe that machinery should be largely used, but used to increase the simplicity of life, not its complexity. Mr. Blatchford, whom we have quoted above as opposed to the factory system, would make English life more agricultural and less manufacturing, but he would have machines do even more than they do today, only as the servant of the whole community, not as the property of capitalists for whom wage-workers slave. He says :

"I propose to make our material lives simple; to spend as little time and labor as possible upon the production of food, clothing, houses, and fuel, in order that we may have more leisure. And I propose to employ that leisure in the enjoyment of life and the acquirement of knowledge. . . . Let us go back to our Manchester street of 100 working class families. Suppose, instead of keeping up the wasteful system I described, we abolish all those miserable and imperfect drying-grounds, wringing-machines, wash-kitchens, and kitchen-ranges, and arrange the street on communal lines.

"We set up one laundry, with all the best machinery; we set up one big drying-field; we set up one great kitchen, one general dining-hall, and one pleasant tea-garden. Then we buy all the provisions and other things in large quantities, and we appoint certain wives as cooks and laundresses, or, as is the case with many military duties, we let the wives take the duties in turn. . . .

"So with the housework when we had simple houses and furniture. Imagine the difference between the cleaning of all the knives by a rapid knife machine turned by an engine, and the drudgery of 100 wives scrubbing at 100 clumsy knife-boards."

Says another socialistic writer :

"At present machinery competes against man. Under proper conditions machinery will serve man. There is no doubt at all that this is the future of machinery; and just as trees grow while the country gentleman is asleep, so while humanity will be amusing itself, or enjoying cultivated leisure—which, and not labor, is the aim of man—or making beautiful things, or reading beautiful things, or simply contemplating the world with admiration and delight, machinery will be doing all the necessary and unpleasant work. The fact is that civilization requires slaves. The Greeks were quite right there. Unless there are slaves to do the ugly, horrible, uninteresting work, culture and contemplation become almost impossible. Human slavery is wrong, insecure, and demoralizing. On mechanical slavery, on the slavery of the machine, the future of the world depends. . . . A great deal of nonsense is being written and talked

nowadays about the dignity of manual labor. There is nothing necessarily dignified about manual labor at all, and most of it is absolutely degrading. It is mentally and morally injurious to man to do anything in which he does not find pleasure, and many forms of labor are quite pleasureless activities, and should be regarded as such. To sweep a slushy crossing for eight hours on a day when the east wind is blowing is a disgusting occupation. To sweep it with mental, moral, or physical dignity seems to me to be impossible. To sweep it with joy would be appalling. Man is made for something better than disturbing dirt. All work of that kind should be done by a machine.

"And I have no doubt that it will be so. Up to the present, man has been, to a certain extent, the slave of machinery, and there is something tragic in the fact that as soon as man had invented a machine to do his work he began to starve. This, however, is, of course, the result of our property system and our system of competition. One man owns a machine which does the work of 500 men. Five hundred men are, in consequence, thrown out of employment, and, having no work to do, become hungry and take to thieving. The one man secures the produce of the machine and keeps it, and has 500 times as much as he should have, and probably, which is of much more importance, a great deal more than he really wants. Were that machine the property of all, every one would benefit by it. It would be an immense advantage to the community. All unintellectual labor; all monotonous, dull labor; all labor that deals with dreadful things, and involves unpleasant conditions, must be done by machinery. Machinery must work for us in coal mines, and do all sanitary services, and be the stoker of steamers, and clean the streets, and run messages on wet days, and do anything that is tedious or distressing."

MAGNA CHARTA ("great charter") was an instrument signed at Runnymede, June 15, 1215, by King John of England, forced thereto by the barons of the kingdom, led by Stephen Langton, Archbishop of Canterbury. Besides restraining certain royal prerogatives that had been abused, and introducing various improvements into the law, it provided for the protection of every freeman from loss of life, liberty, or property, except by the judgment of his peers or the law of the land, while the king was compelled to say, "We will sell to no man; we will not deny or delay to any man right or justice." Magna Charta was the foundation of English liberties, and its chief protective provisions have been incorporated in the Constitution of this country and the separate States. (See **JURY**)

MAINE, SIR HENRY JAMES SUMNER, LL.D., was born in England in 1822, and educated at Pembroke College, Cambridge, and was afterward a tutor in Trinity College. In 1847 he was appointed Regius Professor of Civil Law in the university, but resigned in 1854 to become reader on jurisprudence at the Middle Temple. From 1862-69 he resided in India as law member of the supreme government. On his return to England he was elected Professor of Jurisprudence at Oxford, and the next year was made a member of the council of the Secretary of State for India, and was knighted. In 1875 he published as a pamphlet a lecture delivered at Cambridge on *The Effects of Observation of India on Modern European Thought*. In 1877 he was elected master of Trinity Hall, Cambridge, and in 1887 Professor of International Law. He died at Cannes in 1888. Among his numerous works are *Roman*

Law and Legal Education (1856); *Ancient Law* (1861); *Village Communities* (1871); *Lectures on the Early History of Institutions* (1875); *Early Law and Custom* (1883); *Popular Government* (1885); *International Law* (1888).

MAINE LAW, THE.—Maine was the first of the United States to pass a vigorous prohibitory act. It was first outlined by General James Appleton, but perhaps owes most to Neal Dow (*q.v.*). A crude prohibitory law was passed in 1846, but in June, 1851, the law that has since been known as the Maine Law was enacted. (See **PROHIBITION**.)

MALON, BENOIT, was born at St. Étienne, France, in 1841. He was the son of a peasant and received only elementary instruction. Going to Paris, he worked at various trades. In the last years of the empire he had charge of a grocery established at Puteaux by a cooperative society. In 1868 he became a member of the International (*q.v.*), and for this suffered three months' imprisonment. He became one of the organizers of the federation of *sociétés ouvrières*. He was at the Congress of Basle in 1869. Soon after he became one of the editors of the *Marseillaise*. He was again put in prison in 1870 as a member of the International, but the downfall of the empire set him free. He opposed the government of the national defense in its conduct of affairs. In February, 1871, he was elected a member of the National Assembly, but soon after resigned, at the same time as Rochefort. He was chosen a member of the Commune, but belonged to its moderate minority. He ceased from the first days of May to attend the sessions of the Commune. After the taking of Paris by the Versailles Government, Malon succeeded in escaping to Switzerland, and soon after founded at Geneva the newspaper *La Revanche*. This was suppressed later on by the Swiss Government. He joined Bakunin's Alliance in Switzerland, but soon after went to Italy and settled at Lugano, where he published for a short time a weekly, *Le socialisme progressif*. On being granted amnesty in 1880, he returned to France. He published the *Emancipation* at Lyons, and allied himself for a time with Brousse. In the latter years of his life he devoted himself chiefly to literature, and published the *Revue Socialiste*, which he conducted up to the time of his death, in 1893. Some of his works are: *L'Internationale, son histoire et ses principes* (1872); *Le parti ouvrier en France* (1882); *Histoire du socialisme et des prolétaires* (1881-84, 5 vols.); *Le socialisme réformiste* (1885); *Le socialisme intégral* (1890-91).

MALTHUS, THOMAS ROBERT (see **MALTHUSIANISM**), was born in Albury, Surrey, Eng., in 1766. He was graduated with honors at Jesus College, Cambridge, in 1788, and in 1797 became a fellow of the college. He entered holy orders and divided his time between the university and a small parish in Surrey. In 1798 he published the first edition of his great work under the title *An Essay on the Principle of Population as it Affects the Future Im-*

provement of Society, with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and other Writers. The book grew out of some discussions which Malthus had with his father respecting the perfectibility of society. Malthus had argued that society must always be hindered by the miseries consequent on the tendency of population to increase faster than the means of subsistence. His father, struck by the weight and originality of his views, asked him to put them in writing, and then recommended publication. The book aroused very general interest and discussion, and Mr. Malthus went abroad and traveled in Sweden, Norway, France, and portions of Russia, collecting material for a new edition, which appeared in 1803, and was, in his own words, "a new book." He had found, upon investigating the subject, that "much more had been done" upon it "than he had been aware of." It had "been treated in such a manner by some of the French economists, occasionally by Montesquieu, and, among our own writers, by Dr. Franklin, Sir James Steuart, Mr. Arthur Young, and Mr. Townsend, as to create a natural surprise that it had not excited more of the public attention." "Much, however," he thought, "remained yet to be done. The comparison between the increase of population and food had not, perhaps, been stated with sufficient force and precision," and "few inquiries had been made into the various modes by which the level" between population and the means of subsistence "is effected." The first desideratum here mentioned—the want, namely, of an accurate statement of the relation between the increase of population and food—Malthus supposed he supplied by the celebrated proposition that "population increases in a geometrical, food in an arithmetical ratio."

This exact mathematical proposition, however, he introduced but incidentally, and omitted in later editions, contenting himself with the general proposition that population, unless checked by war, poverty, etc., tended to increase faster than sustenance. His book ran through various editions, the last of which during his lifetime appeared in 1826 and bore the modified title, *An Essay on the Principles of Population, or a View of its Past and Present Effects on Human Happiness, with an Inquiry into the Future Removal or Mitigation of the Evils which it Occasions.*

In 1805 Malthus married happily, and was appointed Professor of Modern History and Political Economy in the East India Company's College at Haileybury. This situation he retained till his death in 1834.

Besides his great work, Malthus wrote *Observations on the Effect of the Corn Laws* (1815); *An Inquiry into the Nature and Progress of Rent* (1815); *Principles of Political Economy* (1820); and *Definitions in Political Economy* (1827). His views on rent were of especial importance, and are believed by some to be the origin of the famous Ricardian law of rent. (See RICARDO; POLITICAL ECONOMY.) The *Encyclopædia Britannica* says of Malthus:

beauty of his character. He bore the popular abuse and misrepresentation without the slightest murmur or sourness of temper. The aim of his inquiries was to promote the happiness of mankind, which could be better accomplished by pointing out the real possibilities of progress than by indulging in vague dreams of perfectibility apart from the actual facts which condition human life."

The only checks on population advocated by Malthus are the moral checks of abstinence from marriage and sexual intercourse. Other checks like war come in as merely natural checks.

MALTHUSIANISM (see MALTHUS) may be defined in brief as the theory first popularized tho not first taught by Malthus, that population has a tendency to multiply faster than subsistence, and that some people must necessarily, therefore, fail to have food unless the race as a whole adopts some measures to prevent the natural increase of its numbers. This is undoubtedly one of the most contested and yet most important questions in social science. Upon the answer to this question depends the right attitude in all problems affecting society's treatment of the poor.

Mr. Benjamin Kidd says (*Social Evolution*, chap. viii.), "Underneath all socialist ideals there yawns the problem of population." Individualism (*q.v.*) rests one of its main arguments upon Malthusianism.

There are two strongly contested views or sets of views upon the subject, but before we can notice these we must see a little more exactly what is meant to-day by Malthusianism. The doctrine as now held by its advocates is not exactly the view advocated by Malthus. Malthus himself, in the first place, somewhat modified his views in the successive editions of his book. (See MALTHUS.) He omitted from the later editions any exact mathematical statement of the relation between population and sustenance. Secondly, Malthus and the earlier Malthusians based their theory on an asserted general tendency in all animate creation to increase beyond the nourishment prepared for it, as evidenced in the vegetable and animal worlds, in the savage and semi-savage civilizations, and even in civilized communities.

Modern Malthusianism, as illustrated, for example, in Professor A. T. Hadley's *Economics* (1896, pp. 41-51), takes a more scientific form. It carefully analyzes the difference between the birth-rate and death-rate of various countries; it finds **Statement.** in agriculture a law of diminishing returns (*q.v.*); it argues that the pressure of population and consequent family responsibility has largely produced the present surplus of food in civilized countries, so that the removal of this pressure would diminish the supply; above all it connects itself with the evolutionary principle of the necessity of natural selection to progress (see EVOLUTION), and that therefore a removal of the pressure of population would mean biological degeneration.

The correctness of this view is both asserted and denied. Most individualists and some socialists accept the theory at least far enough to admit that there is a tendency for population to outstrip sustenance. The individualists usually assert it to be a necessary principle, and that it

"Malthus was one of the most amiable, candid, and cultured of men. In all his private relations he was not only without reproach, but distinguished for the

cannot be prevented without interfering with social progress. Says Professor Hadley (as above, p. 41): "If poverty is inevitable and simply represents a sacrifice of individuals for the sake of the progress of the race, we may and must view with resignation a number of evils which can only be made worse by attempting to eradicate them." Socialist Malthusians, however, while admitting that population does tend to outstrip population, argue that competition is not the only path to progress, and that there may and should be found some way of limiting population to the means

of sustenance. They urge that not enough attention has been given to the biological principle of progress by functional adaptation and by cooperation of organisms. John Stuart Mill, accepting the Malthusian doctrine, argues that socialism is the state of society most favorable to limiting population to means of sustenance. He says (*Political Economy*, Book II., chap. i.):

"Another of the objections to communism is similar to that so often urged against poor laws: that if every member of the community were assured of subsistence for himself and any number of children, on the sole condition of willingness to work, prudential restraint on the multiplication of mankind would be at an end, and population would start forward at a rate which would reduce the community through successive stages of increasing discomfort to actual starvation. There would certainly be much ground for this apprehension if communism provided no motives to restraint, equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of over-population, has the recommendation of tending in an especial degree to the prevention of that evil."

Many, however, deny the correctness of the Malthusian theory. Professor Marshall (*Economics of Industry*, p. 31) says:

"Malthus' statements with regard to the misery that has existed in past ages have been confirmed by more recent historians; but the practical conclusions that he deduced from them are more liable to be disputed. For he could not foresee the inventions and discoveries which were just about to be made when he wrote. He could not foresee how the growth of steam traffic would enable England, on the one hand, to import food from countries where there was a scanty population; and, on the other, to send out her surplus population to cultivate new soils, and to spread the energy and genius of the English people over the earth."

Professor Symes says (*Political Economy*, pp. 10, 11):

"There seems no sufficient ground for the assertion that population tends to increase more rapidly than production. In England it is certain that production has increased far more rapidly than population during the past century, and

Objection. It may fairly be questioned whether the density of the population has not been one of the causes of the high average productiveness of English laborers. These not only support themselves, but produce enough to support a large class in idle luxury, a large class in pauperism, a large class who live by crime, and many classes who

labor with more or less advantage to the community, but not at work which is directly productive of material wealth. The idle rich and the idle poor, clergymen, schoolmasters, actors, musicians, thieves, domestic servants, and others, have to live on what the directly productive classes produce; and tho in all communities there must be a certain proportion of non-producers, it is doubtful whether a thinly populated country could possibly support so large a proportion as England does at the present day.

"On the whole, then, we conclude that every increase of population opens up opportunities for fresh and superior ways of applying labor, and that if the community avails itself of these, the produce of its labor will, in most cases, be more than proportionately increased."

Many seem to forget, too, the enormously increased power of providing food made potent by modern science. Says Mr. D. A. Wells (*Recent Economic Changes*):

"Forty years ago a deficient harvest in any one of the countries of Europe entailed a vast amount of suffering and starvation on their population. To-day the deficiency of any local crop of wheat is comparatively of little consequence, for the prices of cereals in every country readily accessible by railroad and steamships are now regulated not by any local conditions, but by the combined production and consumption of the world; and the day of famines for the people of all such countries has passed forever. The extent to which all local advantages in respect to the supply and prices of food have been equalized in recent years through the railway service of the United States is demonstrated by the fact that a full year's requirement of meat and bread for an adult person can now be moved from the points of their most abundant and cheapest production, 1000 miles, for a cost not in excess of the single day's wages of an average American mechanic or artisan.

"Great improvements have been made during the last 10 or 20 years in the breeding of live stock and its economical management, whereby a greatly increased product of animal food can be obtained from a given number with comparatively little increased labor or expense. In the matter of dairy produce, recognized authorities in England estimate that the average increase in the yield of milk per cow in that country has been at least 40 gals. per annum since 1878; and this for the 3,500,000 cows in milk, owned by British farmers, means 140,000,000 extra gallons of milk over and above what the same animals yielded in 1878; and at 62. per gal. would amount to an extra return of no less than £3,500,000 for the United Kingdom, or £1 per cow. . . ."

"Furthermore, not only has the supply of food increased, but the variety of food available to the masses has become greater. Nearly all tropical fruits that will bear transportation have become as cheap in non-tropical countries as the domestic fruits of the latter, and even cheaper. . . . Thirty or forty years ago fish in its most acceptable form—*viz.*, fresh—was only available to consumers living in close proximity to the ocean; but now fish caught on the waters of the North Pacific, and transported more than 2000 miles, are daily supplied to the markets of the Atlantic slope of the United States; and sea products of the coast of the latter, transported 2000 miles, are regularly furnished in a fresh condition to British markets. To this it should be added that on the very possibility of propagation which Malthus says applied to the animal and vegetable world, the supply of vegetable and animal (including fish) food can be, under proper care, almost indefinitely multiplied. What can be done is shown in part in Japan. Recent investigations by Professor Rein, of the University of Bonn, Germany, show that with an area about the same as the State of California (157,000 square miles), and with only one tenth of such area practically available for cultivation, Japan supports a population of 36,000,000 almost entirely from her own product. Making due allowance for what may be eked out of the nine tenths taken up by forest, desert, and mountain, it appears that the incredible number of 2560 inhabitants are supported from each square mile of cultivated land, or four to the acre. It is well known that this can be done on a small scale, but its application to a nation is marvelous. Nothing is wasted in Japan; everything is utilized, and all arable land has been brought to the highest state of cultivation."

**Marvelous
Increase of
Food Supply.**

There is thus, however, to say the least, no very pressing fear of the world's being unable to sustain its population from lack of food. In the United States, to ignore all the rest of the world, if our population were as dense as that of France, we should have, this side of Alaska, 555,000,000; if as dense as that of Germany, 658,000,000; if as dense as that of England and Wales, 1,452,000,000; if as dense as that of Belgium, 1,574,000,000, or more than the present estimated population of the globe. (See *FOOD SUPPLY*.)

Many opponents of Malthusianism also argue that with increasing civilization and popular education fecundity will, on biological principles, decrease.

The American Cary argued the physiological theory that the total sum of nutriment received by an organized body directs itself, in largest proportion, to the parts of the system which are most used, and that this meant a diminution in the fecundity of human beings, in spite of more abundant feeding, through the greater use of their brains incident to an advanced civilization.

Nevertheless, there is strong evidence claimed for Malthusianism. The possible natural productivity of the human race is undoubtedly very large. It has been calculated by some that population may double itself in 13 years. Malthus considered it safer to argue that it could at least double itself in 25 years. Mill says on this point (*Political Economy*, Book I., chap. x., sec. 2):

"The power of multiplication inherent in all organic life may be regarded as infinite. There is no one species of vegetable or animal which, if the earth were entirely abandoned to it and to the things on which it feeds, would not in a small number of years overspread every region of the globe of which the climate was compatible with its existence. . . .

Evidence for Malthusianism.

It is but a moderate case of fecundity in animals to be capable of quadrupling their numbers in a single year; if they only do as much in half a century, 10,000 will have swelled within two centuries to upward of 2,500,000. The capacity of increase is necessarily in a geometrical progression: the numerical ratio alone is different.

"To this property of organized beings the human species forms no exception. Its power of increase is indefinite, and the actual multiplication would be extraordinarily rapid if the power were exercised to the utmost. It never is exercised to the utmost, and yet in the most favorable circumstances known to exist, which are those of a fertile region colonized from an industrious and civilized community, population has continued for several generations, independently of fresh immigration, to double itself in not much more than 20 years. That the capacity of multiplication in the human species exceeds even this is evident if we consider how great is the ordinary number of children to a family where the climate is good and early marriages usual, and how small a proportion of them die before the age of maturity in the present state of hygienic knowledge where the locality is healthy and the family adequately provided with the means of living. It is a very low estimate of the capacity of increase, if we only assume that in a good sanitary condition of the people each generation may be double the number of the generation which preceded it."

Professor A. T. Hadley (as above, p. 42) says:

"The physiological possibilities of the birth-rate in the human race, when not restrained by intellectual, social, or moral conditions, are thought to be as high as 60 per 1000, tho no statistics show a birth-rate as large as this over any considerable extent of space or time. . . . The difference between the birth-rate and the death-rate in any one year represents the rate of increase

of population for that year. If the birth-rate is 45 per 1000 and the death-rate 25 per 1000, the increase of population is 20 per 1000, or 2 per cent." (For the facts as to birth-rates and death-rates, see *BIRTH AND DEATH-RATE*.)

As to the fact that modern civilizations have an oversupply of food, Professor Hadley argues (*idem*, pp. 47-51) that this is due to competitive and individualistic family responsibility, and under socialistic conditions would disappear. In uncivilized countries he says there is no surplus of food. The history of the English poor law, he argues, shows that natural selection has not done its work. Criminals and paupers habitually defy the principle that every man should earn a living for himself and his family. As to the assertion that fecundity necessarily tends to decrease with civilization, Professor Hadley denies that we have any reason for believing this. He says (p. 48):

"It is true that as society exists at present high comfort and low birth-rate are commonly associated, because comfort is made to depend upon prudence. Let the comfort be made independent of prudence, as in the case of the pauper or criminal, and the birth-rate tends to increase rather than diminish. It may not be exactly true, as some Malthusians would have us believe, that the low birth-rate is the cause of the comfort; but it is much farther from the truth to assert that the comfort is the cause of the low birth-rate. Both are the results of a common cause, the exercise of prudence, which gives high comfort and low birth-rate to those who are capable of practising it."

Finally, as to the future, Professor Hadley argues (p. 43) that the improvements in the arts of producing and utilizing food may increase the power of the world's sustenance, "it is a fact thoroughly established by observation that in any given stage of the arts there is a certain point beyond which increased application of labor and capital does not obtain correspondingly increased supplies of food from a given area."

The views thus quoted present, perhaps, a fair statement of the present condition of the problem. We have quoted Professor Hadley on the Malthusian side rather than any biologist, because Professor Hadley is among the latest economists **Controversy**, to treat the subject, and because the question is practically to-day economic or psychologic rather than biologic. All authorities are agreed that as a matter of fact in civilized countries to-day there is abundance of food if it were rightly distributed, and that science can at least increase this supply for a considerable time under modern social conditions.

The only question is, what has produced this condition in modern countries? Professor Hadley, *e.g.*, says that "no amount of facts such as are accumulated by writers like Nitti will prove anything against the Malthusian theory. Statistics show that high comfort and low birth-rate go hand in hand. They are absolutely incapable of showing which is cause and which is effect." Individualists say it is individual responsibility and pressure of existence that causes a low birth rate, so that under socialist conditions, removing pressure, you would not have the present supply of food. Socialists claim that under socialism you would increase supply and not increase the rate of human fecundi-

ty; and this is mainly a psychologic problem. (See INDIVIDUALISM; SOCIALISM.) As for the problem which is purely biologic, how far progress depends on the struggle for existence and natural selection, see EVOLUTION; INDIVIDUALISM; SOCIALISM; SOCIOLOGY.

One other view, however, must be here noticed. Many writers and workers for social reform accept the Malthusian theory as to the tendency

to overpopulation, and argue that it is moral and necessary and humane

Neo-Malthusianism. to check population, especially among the poor, by physical means.

This view is sometimes called *Neo-Malthusianism*, and is earnestly defended on moral and humanitarian grounds. Richard Carlisle, Dr. Charles Knowlton, R. D. Owen, James Watson, and later Austin Holyoake, Charles Bradlaugh, and Mrs. Annie Besant (who has since, we believe, given up belief in Malthusianism) were the most active in popularizing this theory among the poor, and in spite of misrepresentation, abuse, persecution, and prosecution in the courts, continued the propaganda, supported by such men as John Stuart Mill, George J. Holyoake, Robert Dale Owen, and a long list of physicians. Knowing well and horrified by the conditions of life in the slums, seeing the suffering involved in large families, feeling that under conditions where modesty and privacy were all but impossible (see SLUMS), and hope equally faint, late marriages inevitably mean early prostitution, they argued that Neo-Malthusianism was the most moral course. Women, they said, in the slums were but slaves, sometimes of drunken husbands, at best of foul surroundings. Neo-Malthusianism, they said, was the only practical escape from overpopulation and wretched demoralization. Boldly, therefore, they preached as right what they said the wealthy denounced but practised.

MANIFESTOES.—We reprint here two socialist manifestoes. In January, 1848, Karl Marx and Frederick Engels prepared a "manifesto" for the communist, or, as it is now called, the socialist movement. It has to some extent been supplanted by more recent statements; but as the first official statement of this movement we give it in full, as recently edited by Mr. Engels.

As a recent statement of socialism, we reprint a manifesto agreed upon in 1893 by representatives of all the leading socialist societies of England.

MANIFESTO OF THE COMMUNIST PARTY. BY KARL MARX AND FREDERICK ENGELS (1848).

A spectre is haunting Europe—the spectre of communism. All the powers of old Europe have entered into a holy alliance to exercise this spectre—Pope and Czar, Metternich and Guizot, French Radicals and German police spies.

Where is the party in opposition that has not been derided as communistic by its opponents in power? Where the opposition that has not hurled back the branding reproach of communism against the more advanced opposition parties, as well as against its reactionary adversaries?

Two things result from this fact:

1. Communism is already acknowledged by all European powers to be itself a power.

2. It is high time that communists should openly, in the face of the whole world, publish their views, their aims, their tendencies, and meet this nursery tale of the spectre of communism with a manifesto of the party itself.

To this end, communists of various nationalities have assembled in London and sketched the following manifesto, to be published in the English, French, German, Italian, Flemish, and Danish languages.

1. BOURGEOIS AND PROLETARIANS.

The history of all hitherto existing society is the history of class struggles.

Freeman and slave, patrician and plebeian, lord and serf, guild-master and journeyman, in a word, oppressor and oppressed, stood in constant opposition to one another, carried on an uninterrupted, now hidden, now open fight, a fight that each time ended either in a revolutionary reconstitution of society at large or in the common ruin of the contending classes.

In the earlier epochs of history we find almost everywhere a complicated arrangement of society into various orders, a manifold gradation of social rank. In ancient Rome we have patricians, knights, plebeians, slaves; in the middle ages, feudal lords, vassals, guild-masters, journeymen, apprentices, serfs; in almost all of these classes, again, subordinate gradations.

The modern bourgeois society that has sprouted from the ruins of feudal society has not done away with class antagonisms. It has but established new classes, new conditions of oppression, new forms of struggle in place of the old ones.

Our epoch, the epoch of the bourgeoisie, possesses, however, this distinctive feature: it has simplified the class antagonisms. Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other: bourgeoisie and proletariat.

From the serfs of the Middle Ages sprang the chartered burghers of the earliest towns. From these bourgeois the first elements of the bourgeoisie were developed.

The discovery of America, the rounding of the Cape, opened up fresh ground for the rising bourgeoisie. The East Indian and Chinese markets, the colonization of America, trade with the colonies, the increase in the means of exchange and in commodities generally, gave to commerce, to navigation, to industry an impulse never before known, and thereby to the revolutionary element in the tottering feudal society a rapid development.

The feudal system of industry, under which industrial production was monopolized by close guilds, now no longer sufficed for the growing wants of the new markets. The manufacturing system took its place. The guild-masters were pushed on one side by the manufacturing middle class; division of labor between the different corporate guilds vanished in the face of division of labor in each single workshop.

Meantime, the markets kept ever growing, the demand ever rising. Even manufacture no longer sufficed. Thereupon, steam and machinery revolutionized industrial production. The place of manufacture was taken by the giant, modern industry, the place of the industrial middle class by industrious millionaires, the leaders of whole industrial armies, the modern bourgeois.

Modern industry has established the world market, for which the discovery of America paved the way. This market has given an immense development to commerce, to navigation, to communication by land. This development has, in its turn, reacted on the extension of industry; and in proportion as industry, commerce, navigation, railways extended, in the same proportion the bourgeoisie developed, increased its capital, and pushed into the background every class handed down from the Middle Ages.

We see, therefore, how the modern bourgeoisie is itself the product of a long course of development, of a series of revolutions in the modes of production and of exchange.

Each step in the development of the bourgeoisie was accompanied by a corresponding political advance of that class. An oppressed class under the sway of the feudal nobility, an armed and self-governing association in the medieval commune, here independent urban republic (as in Italy and Germany), there taxable "third estate" of the monarchy (as in France), afterward, in the period of manufac-

ture proper, serving either the semi-feudal or the absolute monarchy as a counterpoise against the nobility, and, in fact, corner-stone of the great monarchies in general, the bourgeoisie has at last, since the establishment of modern industry and of the world market, conquered for itself, in the modern representative State, exclusive political sway. The executive of the modern State is but a committee for managing the common affairs of the whole bourgeoisie.

The bourgeoisie, historically, has played a most revolutionary part.

The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations. It has pitilessly torn asunder the motley feudal ties that bound man to his "natural superiors," and has left remaining no other nexus between man and man than naked self-interest, than callous "cash payment." It has drowned the most heavenly ecstasies of religious fervor, of chivalrous enthusiasm, of Philistine sentimentalism in the icy water of egotistical calculation. It has resolved personal worth into exchange value, and in place of the numberless indefeasible chartered freedoms has set up that single, unconscionable freedom—free trade. In one word, for exploitation, veiled by religious and political illusions, it has substituted naked, shameless, direct, brutal exploitation.

The bourgeoisie has stripped of its halo every occupation hitherto honored and looked up to with reverent awe. It has converted the physician, the lawyer, the priest, the poet, the man of science into its paid wage-laborers.

The bourgeoisie has torn away from the family its sentimental veil, and has reduced the family relation to a mere money relation.

The bourgeoisie has disclosed how it came to pass that the brutal display of vigor in the Middle Ages, which reactionists so much admire, found its fitting complement in the most slothful indolence. It has been the first to show what man's activity can bring about. It has accomplished wonders far surpassing Egyptian pyramids, Roman aqueducts, and Gothic cathedrals; it has conducted expeditions that put in the shade all former exoduses of nations and crusades.

The bourgeoisie cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society. Conservation of the old modes of production in unaltered form was, on the contrary, the first condition of existence for all earlier industrial classes. Constant revolutionizing of production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation distinguish the bourgeois epoch from all earlier ones. All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned, and man is at last compelled to face with sober senses his real conditions of life and his relations with his kind.

The need of a constantly expanding market for its products chases the bourgeoisie over the whole surface of the globe. It must nestle everywhere, settle everywhere, establish connections everywhere.

The bourgeoisie has through its exploitation of the world market given a cosmopolitan character to production and consumption in every country. To the great chagrin of reactionists, it has drawn from under the feet of industry the national ground on which it stood. All old-established

Bourgeoisie. national industries have been destroyed or are daily being destroyed. They are dislodged by new industries whose introduction becomes a life and death question for all civilized nations, by industries that no longer work up indigenous raw material, but raw material drawn from the remotest zones; industries whose products are consumed not only at home, but in every quarter of the globe. In place of the old wants, satisfied by the productions of the country, we find new wants, requiring for their satisfaction the products of distant lands and climes. In place of the old local and national seclusion and self-sufficiency, we have intercourse in every direction, universal interdependence of nations. And as in material so also in intellectual production. The intellectual creations of individual nations become common property. National one-sidedness and narrow-mindedness become more and more impossible, and from the numerous national and local literatures there arises a world literature.

The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facili-

tated means of communication, draws all, even the most barbarian nations into civilization. The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese walls, with which it forces the barbarians' intensely obstinate hatred of foreigners to capitulate. It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilization into their midst—i.e., to become bourgeois themselves. In one word, it creates a world after its own image.

The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased the urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it has made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on the civilized ones, nations of peasants on nations of bourgeois, the East on the West.

The bourgeoisie keeps more and more doing away with the scattered state of the population, of the means of production and of property. It has agglomerated population, centralized means of production, and has concentrated property in a few hands. The necessary consequence of this was political centralization. Independent or but loosely connected provinces, with separate interests, laws, governments, and systems of taxation, became lumped together into one nation, with one government, one code of laws, one national class interest, one frontier, and one customs tariff.

The bourgeoisie, during its rule of scarce 100 years, has created more massive and more colossal productive forces than have all preceding generations together. Subjection of nature's forces to man, machinery, application of chemistry to industry and agriculture, steam navigation, railways, electric telegraphs, clearing of whole continents for cultivation, canalization of rivers, whole populations conjured out of the ground—what earlier century had even a presentiment that such productive forces slumbered in the lap of social labor?

We see, then, the means of production and of exchange, on whose foundation the bourgeoisie built itself up, were generated in feudal society. At a certain stage in the development of these means of production and of exchange, the conditions under which feudal society produced and exchanged, the feudal organization of agriculture and manufacturing industry, in one word, the feudal relations of property became no longer compatible with the already developed productive forces; they became so many fetters. They had to be burst asunder; they were burst asunder.

Into their place stepped free competition, accompanied by a social and political constitution adapted to it, and by the economical and political sway of the bourgeois class.

A similar movement is going on before our own eyes. Modern bourgeois society, with its relations of production, of exchange, and of property, a society that has conjured up such gigantic means of production and of exchange, is like the sorcerer who is no longer able to control the powers of the nether world whom he has called up by his spells. For many a decade past the history of industry and commerce is but the history of the revolt of modern productive forces against modern conditions of production, against the property relations that are the conditions for the existence of the bourgeoisie and of its rule. It is enough to mention the commercial crises that by their periodical return put on its trial, each time more threateningly, the existence of the entire bourgeois society. In these crises a great part not only of the existing products, but also of the previously created productive forces, are periodically destroyed. In these crises there breaks out an epidemic that, in all earlier epochs, would have seemed an absurdity—the epidemic of over-production. Society suddenly finds itself put back into a state of momentary barbarism; it appears as if a famine, a universal war of devastation, had cut off the supply of every means of subsistence; industry and commerce seem to be destroyed; and why? Because there is too much civilization, too much means of subsistence, too much industry, too much commerce. The productive forces at the disposal of society no longer tend to further the development of the conditions of bourgeois property; on the contrary, they have become too powerful for these conditions, by which they are fettered, and so soon as they overcome these fetters they bring disorder into the whole of bourgeois society, endanger the existence of bourgeois property. The conditions of bourgeois

society are too narrow to comprise the wealth created by them. And how does the bourgeoisie get over these crises? On the one hand, by enforced destruction of a mass of productive forces; on the other, by the conquest of new markets, and by the more thorough exploitation of the old ones. That is to say, by paving the way for more extensive and more destructive crises, and by diminishing the means whereby crises are prevented.

The weapons with which the bourgeoisie felled feudalism to the ground are now turned against the bourgeoisie itself.

But not only has the bourgeoisie forged the weapons that bring death to itself; it has also called into existence the men who are to wield those weapons—the modern working class—the proletarians.

In proportion as the bourgeoisie, *i. e.*, capital, is developed, in the same proportion is the proletariat, the modern working class, developed, a class of laborers who live only so long as they find work, and who find work only so long as their labor increases capital. These laborers, who must sell themselves piecemeal, are a commodity, like every other article of commerce, and are consequently exposed to all the vicissitudes of competition, to all the fluctuations of the market.

Owing to the extensive use of machinery and to division of labor, the work of the proletarians has lost all individual character, and, consequently, all charm for the workman. He becomes an appendage of the machine, and it is only

Proletariat.

the most simple, most monotonous, and most easily acquired knack that is required of him. Hence, the cost of production of a workman is restricted almost entirely to the means of subsistence that he requires for his maintenance and for the propagation of his race. But the price of a commodity, and therefore also of labor, is equal to its cost of production. In proportion, therefore, as the repulsiveness of the work increases, the wage decreases. Nay more, in proportion as the use of machinery and division of labor increase, in the same proportion the burden of toil also increases, whether by prolongation of the working hours, by increase of the work exacted in a given time, or by increased speed of the machinery, etc.

Modern industry has converted the little workshop of the patriarchal master into the great factory of the industrial capitalist. Masses of laborers, crowded into the factory, are organized like soldiers. As privates of the industrial army, they are placed under the command of a perfect hierarchy of officers and sergeants. Not only are they slaves of the bourgeois class and of the bourgeois State, they are daily and hourly enslaved by the machine, by the overseer, and, above all, by the individual bourgeois manufacturer himself. The more openly this despotism proclaims gain to be its end and aim, the more petty, the more hateful, and the more embittering it is.

The less the skill and exertion of strength implied in manual labor, in other words, the more modern industry becomes developed, the more is the labor of men superseded by that of women. Differences of age and sex have no longer any distinctive social validity for the working class. All are instruments of labor, more or less expensive to use, according to their age and sex.

No sooner is the exploitation of the laborer by the manufacturer, so far as an end, that he receives his wages in cash, than he is set upon by the other portions of the bourgeoisie—the landlord, the shopkeeper, the pawnbroker, etc.

The lower strata of the middle class—the small tradespeople, shopkeepers, and retired tradesmen generally, the handicraftsmen and peasants—all these sink gradually into the proletariat, partly because their diminutive capital does not suffice for the scale on which modern industry is carried on, and is swamped in the competition with the large capitalists, partly because their specialized skill is rendered worthless by new methods of production. Thus the proletariat is recruited from all classes of the population.

The proletariat goes through various stages of development. With its birth begins its struggle with the bourgeoisie. At first the contest is carried on by individual laborers, then by the work-people of a factory, then by the operatives of one trade, in one locality, against the individual bourgeois who directly exploits them. They direct their attacks not against the bourgeois conditions of production, but against the instruments of production themselves; they destroy imported wares that compete with their labor, they smash to pieces machinery, they set factories ablaze, they seek to restore by force the vanished status of the workman of the middle ages.

At this stage the laborers still form an incoherent mass scattered over the whole country, and broken up by their mutual competition. If anywhere they unite to form more compact bodies, this is not yet the consequence of their own active union, but of the union of the bourgeoisie, which class, in order to attain its own political ends, is compelled to set the whole proletariat in motion, and is, moreover, yet, for a time, able to do so. At this stage, therefore, the proletarians do not fight their enemies, but the enemies of their enemies, the remnants of absolute monarchy, the landowners, the non-industrial bourgeois, the petty bourgeoisie. Thus the whole historical movement is concentrated in the hands of the bourgeoisie; every victory so obtained is a victory for the bourgeoisie.

But with the development of industry the proletariat not only increases in number; it becomes concentrated in greater masses, its strength grows, and it feels that strength more. The various interests and conditions of life within the ranks of the proletariat are more and more equalized, in proportion as machinery obliterates all distinctions of labor, and nearly everywhere reduces wages to the same low level. The growing competition among the bourgeois, and the resulting commercial crises, make the wages of the workers ever more fluctuating. The unceasing improvement of machinery, ever more rapidly developing, makes their livelihood more and more precarious; the collisions between individual workmen and individual bourgeois take more and more the character of collisions between two classes. Thereupon the workers begin to form combinations (trades unions) against the bourgeois; they club together in order to keep up the rate of wages; they found permanent associations in order to make provision beforehand for these occasional revolts. Here and there the contest breaks out into riots.

Now and then the workers are victorious, but only for a time. The real fruit of their battles lies not in the immediate result, but in the ever-expanding union of the workers. This union is helped on by the improved means of communication that are created by modern industry, and that place the workers of different localities in contact with one another. It was just this contact that was needed to centralize the numerous local struggles, all of the same character, into one national struggle between classes. But every class struggle is a political struggle. And that union, to attain which the burghers of the Middle Ages, with their miserable highways, required centuries, the modern proletarians, thanks to railways, achieve in a few years.

This organization of the proletarians into a class, and consequently into a political party, is continually being upset again by the competition between the workers themselves. But it ever rises up again, stronger, firmer, mightier. It compels legislative recognition of particular interests of the workers by taking advantage of the divisions among the bourgeoisie itself. Thus the Ten Hours' Bill in England was carried.

Altogether collisions between the classes of the old society further, in many ways, the course of development of the proletariat. The bourgeoisie finds itself involved in a constant battle—at first with the aristocracy; later on, with those portions of the bourgeoisie itself whose interests have become antagonistic to the progress of industry; at all times, with the bourgeoisie of foreign countries. In all these battles it sees itself compelled to appeal to the proletariat, to ask for its help, and thus to drag it into the political arena. The bourgeoisie itself, therefore, supplies the proletariat with its own elements of political and general education; in other words, it furnishes the proletariat with weapons for fighting the bourgeoisie.

Further, as we have already seen, entire sections of the ruling classes are, by the advance of industry, precipitated into the proletariat, or are at least threatened in their conditions of existence. These also supply the proletariat with fresh elements of enlightenment and progress.

Finally, in times when the class struggle nears the decisive hour, the process of dissolution going on within the ruling class, in fact, within the whole range of old society, assumes such a violent, glaring character, that a small section of the ruling class cuts itself adrift, and joins the revolutionary class—the class that holds the future in its hands. Just as, therefore, at an earlier period a section of the nobility went over to the bourgeoisie, so now a portion of the bourgeoisie goes over to the proletariat, and in particular a portion of the bourgeois idealists, who have raised themselves to the level of comprehending theoretically the historical movement as a whole.

Of all the classes that stand face to face with the bourgeoisie to-day, the proletariat alone is a really revolutionary class. The other classes decay and finally disappear in the face of modern industry; the proletariat is its special and essential product.

The lower middle class, the small manufacturer, the shopkeeper, the artisan, the peasant, all these fight against the bourgeoisie, to save from extinction their existence as fractions of the middle class. They are therefore not revolutionary, but conservative. Nay more, they are reactionary, for they try to roll back the wheel of history. If by chance they are revolutionary, they are so only in view of their impending transfer into the proletariat; they thus defend not their present, but their future interests; they desert their own standpoint to place themselves at that of the proletariat.

The "dangerous class," the social scum, that passively rotting mass thrown off by the lowest layers of old society, may, here and there, be swept into the movement by a proletarian revolution; its conditions of life, however, prepare it far more for the part of a bribed tool of reactionary intrigue.

In the conditions of the proletariat, those of old society at large are already virtually swamped. The proletarian is without property; his relation to his wife and children has no longer anything in common with the bourgeois family relations; modern industrial labor, modern subjection to capital, the same in England as in France, in America as in Germany, has stripped him of every trace of national character. Law, morality, religion, are to him so many bourgeois prejudices, behind which lurk in ambush just as many bourgeois interests.

All the preceding classes that got the upper hand sought to fortify their already acquired status by subjecting society at large to their conditions of appropriation. The proletarians cannot become masters of the productive forces of society except by abolishing their own previous mode of appropriation, and thereby also every other previous mode of appropriation. They have nothing of their own to secure and to fortify; their mission is to destroy all previous securities for and insurances of individual property.

All previous historical movements were movements of minorities or in the interest of minorities. The proletarian movement is the self-conscious, independent movement of the immense majority in the interest of the immense majority. The proletariat, the lowest stratum of our present society, cannot stir, cannot raise itself up without the whole superincumbent strata of official society being sprung into the air.

The Struggle.

The not in substance, yet in form, the struggle of the proletariat with the bourgeoisie is at first a national struggle. The proletariat of each country must, of course, first of all settle matters with its own bourgeoisie.

In depicting the most general phases of the development of the proletariat, we traced the more or less veiled civil war, raging within existing society, up to the point where that war breaks out into open revolution, and where the violent overthrow of the bourgeoisie lays the foundation for the sway of the proletariat.

Hitherto, every form of society has been based, as we have already seen, on the antagonism of oppressing and oppressed classes. But in order to oppress a class, certain conditions must be assured to it under which it can, at least, continue its slavish existence. The serf, in the period of serfdom, raised himself to membership in the commune, just as the petty bourgeois, under the yoke of feudal absolutism, managed to develop into a bourgeois. The modern laborer, on the contrary, instead of rising with the progress of industry, sinks deeper and deeper below the conditions of existence of his own class. He becomes a pauper, and pauperism develops more rapidly than population and wealth. And here it becomes evident that the bourgeoisie is unfit any longer to be the ruling class in society, and to impose its conditions of existence upon society as an overriding law. It is unfit to rule because it is incompetent to assure an existence to its slave within his slavery, because it cannot help letting him sink into such a state, that it has to feed him, instead of being fed by him. Society can no longer live under this bourgeoisie; in other words, its existence is no longer compatible with society.

The essential condition for the existence and for the sway of the bourgeois class is the formation and augmentation of capital; the condition for capital is wage-labor. Wage-labor rests exclusively on competition between the laborers. The advance of industry,

whose involuntary promoter is the bourgeoisie, replaces the isolation of the laborers, due to competition, by their revolutionary combination, due to association. The development of modern industry, therefore, cuts from under their feet the very foundation on which the bourgeoisie produces and appropriates products. What the bourgeoisie therefore produces, above all, are its own grave-diggers. Its fall and the victory of the proletariat are equally inevitable.

II. PROLETARIANS AND COMMUNISTS.

In what relation do the communists stand to the proletarians as a whole?

The communists do not form a separate party opposed to other working-class parties.

They have no interests separate and apart from those of the proletariat as a whole.

They do not set up any sectarian principles of their own, by which to shape and mold the proletarian movement.

The communists are distinguished from the other working-class parties by this only: 1. In the national struggles of the proletarians of the different countries, they point out and bring to the front the common interests of the entire proletariat, independently of all nationality. 2. In the various stages of development which the struggle of the working class against the bourgeoisie has to pass through, they always and everywhere represent the interests of the movement as a whole.

The communists, therefore, are, on the one hand, practically, the most advanced and resolute section of the working-class parties of every country, that section which pushes forward all others; on the other hand, theoretically, they have over the great mass of the proletariat the advantage of clearly understanding the line of march, the conditions, and the ultimate general results of the proletarian movement.

The immediate aim of the communists is the same as that of all the other proletarian parties: formation of the proletariat into a class, overthrow of the bourgeois supremacy, conquest of political power by the proletariat.

The theoretical conclusions of the communists are in no way based on ideas or principles that have been invented or discovered by this or that would-be universal reformer.

They merely express, in general terms, actual relations springing from an existing class struggle, from a historical movement going on under our very eyes. The abolition of existing property relations is not at all a distinctive feature of communism.

All property relations in the past have continually been subject to historical change consequent upon the change in historical conditions.

The French Revolution, for example, abolished feudal property in favor of bourgeois property.

The distinguishing feature of communism is not the abolition of property generally, but the abolition of bourgeois property. But modern bourgeois private property is the final and most complete expression of the system of producing and appropriating products that is based on class antagonisms, on the exploitation of the many by the few.

In this sense, the theory of the communists may be summed up in the single sentence: Abolition of private property.

We communists have been reproached with the desire of abolishing the right of personally acquiring property as the fruit of a man's own labor, which property is alleged to be the groundwork of all personal freedom, activity, and independence.

Hard-won, self-acquired, self-earned property! Do you mean the property of the petty artisan and of the small peasant, a form of property that preceded the bourgeois form? There is no need to abolish that; the development of industry has to a great extent already destroyed it, and is still destroying it daily.

Or do you mean modern bourgeois private property?

But does wage-labor create any property for the laborer? Not a bit. It creates capital—*i.e.*, that kind of property which exploits wage-labor, and which cannot increase except upon condition of begetting a new supply of wage-labor for fresh exploitation. Property, in its present form, is based on the antagonism of capital and wage-labor. Let us examine both sides of this antagonism.

To be a capitalist is to have not only a purely personal, but a social *status* in production. Capital is a collective product, and only by the united action of many members, nay in the last resort, only by the united action of all members of society, can it be set in motion.

Capital is therefore not a personal, it is a social power.

When, therefore, capital is converted into common property, into the property of all members of society, personal property is not thereby transformed into social property. It is only the social character of the property that is changed. It loses its class character. Let us now take wage-labor.

The average price of wage-labor is the minimum wage—*i. e.*, that quantum of the means of subsistence which is absolutely requisite to keep the laborer in

bare existence as a laborer. What, therefore, the wage-laborer appropriates by means of his labor merely suffices to prolong and reproduce a bare existence.

Capital and Labor.

We by no means intend to abolish this personal appropriation of the products of labor, an appropriation that is made for the maintenance and reproduction of human life, and that leaves no surplus wherewith to command the labor of others. All that we want to do away with is the miserable character of this appropriation, under which the laborer lives merely to increase capital, and is allowed to live only in so far as the interest of the ruling class requires it.

In bourgeois society, living labor is but a means to increase accumulated labor. In communist society, accumulated labor is but a means to widen, to enrich, to promote the existence of the laborer.

In bourgeois society, therefore, the past dominates the present; in communist society, the present dominates the past. In bourgeois society capital is independent and has individuality, while the living person is dependent and has no individuality.

And the abolition of this state of things is called by the bourgeois abolition of individuality and freedom! And rightly so. The abolition of bourgeois individuality, bourgeois independence, and bourgeois freedom is undoubtedly aimed at.

By freedom is meant, under the present bourgeois conditions of production, free trade, free selling and buying.

But if selling and buying disappear, free selling and buying disappear also. This talk about free selling and buying, and all the other "brave words" of our bourgeoisie about freedom in general, have a meaning, if any, only in contrast with restricted selling and buying, with the fettered traders of the Middle Ages, but have no meaning when opposed to the communistic abolition of buying and selling, of the bourgeois conditions of production, and of the bourgeoisie itself.

You are horrified at our intending to do away with private property. But in your existing society private property is already done away with for nine tenths of the population; its existence for the few is solely due to its non-existence in the hands of those nine tenths. You reproach us, therefore, with intending to do away with a form of property, the necessary condition for whose existence is the non-existence of any property for the immense majority of society.

In one word, you reproach us with intending to do away with your property. Precisely so; that is just what we intend.

From the moment when labor can no longer be converted into capital, money or rent, into a social power capable of being monopolized, *i. e.* from the moment when individual property can no longer be transformed into bourgeois property, into capital, from that moment, you say, individuality vanishes.

You must, therefore, confess that by "individual" you mean no other person than the bourgeois, than the middle-class owner of property. This person must, indeed, be swept out of the way, and made impossible.

Communism deprives no man of the power to appropriate the products of society: all that it does is to deprive him of the power to subjugate the labor of others by means of such appropriation.

It has been objected, that upon the abolition of private property all work will cease and universal laziness will overtake us.

According to this, bourgeois society ought long ago to have gone to the dogs through sheer idleness; for those of its members who work acquire nothing, and those who acquire anything do not work. The whole of this objection is but another expression of the tautology: that there can no longer be any wage-labor when there is no longer any capital.

All objections urged against the communistic mode of producing and appropriating material products have, in the same way, been urged against the communistic modes of producing and appropriating intellectual products. Just as, to the bourgeois, the disappearance of class property is the disappearance of production itself, so the disappearance of class culture is

to him identical with the disappearance of all culture.

That culture, the loss of which he laments, is for the enormous majority a mere training to act as a machine.

But don't wrangle with us so long as you apply to our intended abolition of bourgeois property the standard of your bourgeois notions of freedom, culture, law, etc. Your very ideas are but the outgrowth of the conditions of your bourgeois production and bourgeois property, just as your jurisprudence is but the will of your class made into a law for all, a will whose essential character and direction are determined by the economical conditions of existence of your class.

The selfish misconception that induces you to transform into eternal laws of nature and of reason the social forms springing from your present mode of production and form of property—historical relations that rise and disappear in the progress of production—this misconception you share with every ruling class that has preceded you. What you see clearly in the case of ancient property, what you admit in the case of feudal property, you are of course forbidden to admit in the case of your own bourgeois form of property.

Abolition of the family! Even the most radical flare up at this infamous proposal of the communists.

On what foundation is the present family, the bourgeois family, based? On capital, on private gain. In its completely developed form this family exists only among the bourgeoisie. But this state of things finds its complement in the practical absence of the family among the proletarians and in public prostitution.

The bourgeois family will vanish as a matter of course when its complement vanishes, and both will vanish with the vanishing of capital.

Do you charge us with wanting to stop the exploitation of children by their parents? To this crime we plead guilty.

But, you will say, we destroy the most hallowed of relations when we replace home education by social.

And your education! Is not that also social and determined by the social conditions under which you educate by the intervention, direct or indirect, of society by means of schools, etc.?

The communists have not invented **The Family.**

They do but seek to alter the character of that intervention, and to rescue education from the influence of the ruling class.

The bourgeois clap-trap about the family and education, about the hallowed correlation of parent and child, becomes all the more disgusting, the more, by the action of modern industry, all family ties among the proletarians are torn asunder, and their children transformed into simple articles of commerce and instruments of labor.

But you communists would introduce community of women, screams the whole bourgeoisie in chorus.

The bourgeois sees in his wife a mere instrument of production. He hears that the instruments of production are to be exploited in common, and, naturally, can come to no other conclusion than that the lot of being common to all will likewise fall to the women.

He has not even a suspicion that the real point aimed at is to do away with the status of women as mere instruments of production.

For the rest, nothing is more ridiculous than the virtuous indignation of our bourgeois at the community of women which, they pretend, is to be openly and officially established by the communists. The communists have no need to introduce community of women; it has existed almost from time immemorial.

Our bourgeois, not content with having the wives and daughters of their proletarians at their disposal, not to speak of common prostitutes, take the greatest pleasure in seducing each other's wives.

Bourgeois marriage is in reality a system of wives in common, and thus, at the most, what the communists might possibly be reproached with is that they desire to introduce, in substitution for a hypocritically concealed, an openly legalized community of women. For the rest, it is self-evident that the abolition of the present system of production must bring with it the abolition of the community of women springing from that system—*i. e.*, of prostitution both public and private.

The communists are further reproached with desiring to abolish countries and nationality.

The working men have no country. We cannot take from them what they have not got. Since the proletariat must first of all acquire political supremacy, must rise to be the leading class of the nation, must constitute itself *the* nation, it is, so far, itself national, tho' not in the bourgeois sense of the word.

National differences and antagonisms between peoples are daily more and more vanishing, owing to the development of the bourgeoisie, to freedom of commerce, to the world-market, to uniformity in the mode of production and in the conditions of life corresponding thereto.

The supremacy of the proletariat will cause them to vanish still faster. United action of the leading civilized countries at least is one of the first conditions for the emancipation of the proletariat.

In proportion as the exploitation of one individual by another is put an end to, the exploitation of one nation by another will also be put an end to. In proportion as the antagonism between classes within the nation vanishes, the hostility of one nation to another will come to an end.

The charges against communism made from a religious, a philosophical, and, generally, from an ideological standpoint, are not deserving of serious examination.

Does it require deep intuition to comprehend that man's ideas, views, and conceptions—in one word, man's consciousness, changes with every change in the conditions of his material existence, in his social relations, and in his social life?

What else does the history of ideas prove than that intellectual production changes its character in proportion as material production is changed? The ruling ideas of each age have ever been the ideas of its ruling class.

When people speak of ideas that revolutionize society, they do but express the fact that within the old society the elements of a new one have been created, and that the dissolution of the old ideas keeps even pace with the dissolution of the old conditions of existence.

When the ancient world was in its last throes the ancient religions were overcome by Christianity. When Christian ideas succumbed in the eighteenth century to rationalist ideas, feudal society fought its death battle with the then revolutionary bourgeoisie. The ideas of religious liberty and freedom of conscience merely gave expression to the sway of free competition within the domain of knowledge.

"Undoubtedly," it will be said, "religious, moral, philosophical, and juridical ideas have been modified in the course of historical development. But religion, morality, philosophy, political science, and law constantly survived this change."

"There are besides eternal truths, such as freedom, justice, etc., that are common to all states of society. But communism abolishes eternal truths, it abolishes all religion and all morality, instead of constituting them on a new basis; it therefore acts in contradiction to all past historical experience."

What does this accusation reduce itself to? The history of all past society has consisted in the development of class antagonisms, antagonisms that assumed different forms at different epochs.

But whatever form they may have taken, one fact is common to all past ages—*viz.*, the exploitation of one part of society by the other. No wonder, then, that the social consciousness of past ages, despite all the multiplicity and variety it displays, moves within certain common forms or general ideas, which cannot completely vanish except with the total disappearance of class antagonisms.

The communist revolution is the most radical rupture with traditional property relations; no wonder that its development involves the most radical rupture with traditional ideas.

But let us have done with the bourgeois objections to communism.

We have seen above that the first step in the revolution by the working class is to raise the proletariat to the position of ruling class, to win the battle of democracy.

The proletariat will use its political supremacy to wrest, by degrees, all capital from the bourgeoisie, to centralize all instruments of production in the hands of the State—*i.e.*, of the proletariat organized as the ruling class; and to increase the total of productive forces as rapidly as possible.

Of course, in the beginning this cannot be effected except by means of despotic inroads on the rights of property and on the conditions of bourgeois production; by means of measures, therefore, which appear economically unjust and untenable, but which in the course of the movement outstrip themselves, necessitate further inroads upon the old social order, and are unavoidable as a means of entirely revolutionizing the mode of production.

Communism. These measures will of course be different in different countries.

Nevertheless, in the most advanced countries the following will be pretty generally applicable:

1. Abolition of property in land and application of all rents of land to public purposes.
2. A heavy progressive or graduated income tax.
3. Abolition of all right of inheritance.
4. Confiscation of the property of all emigrants and rebels.
5. Centralization of credit in the hands of the State, by means of a national bank with State capital and an exclusive monopoly.
6. Centralization of the means of communication and transport in the hands of the State.
7. Extension of factories and instruments of production owned by the State: the bringing into cultivation of waste lands, and the improvement of the soil generally in accordance with a common plan.
8. Equal liability of all to labor. Establishment of industrial armies, especially for agriculture.
9. Combination of agriculture with manufacturing industries; gradual abolition of the distinction between town and country, by a more equable distribution of the population over the country.
10. Free education for all children in public schools. Abolition of children's factory labor in its present form. Combination of education with industrial production, etc.

When, in the course of development, class distinctions have disappeared, and all production has been concentrated in the hands of a vast association of the whole nation, the public power will lose its political character. Political power, properly so called, is merely the organized power of one class for oppressing another. If the proletariat during its contest with the bourgeoisie is compelled, by the force of circumstances, to organize itself as a class, if, by means of a revolution, it makes itself the ruling class, and as such sweeps away by force the old conditions of production, then it will, along with these conditions, have swept away the conditions for the existence of class antagonisms, and of classes generally, and will thereby have abolished its own supremacy as a class.

In place of the old bourgeois society, with its classes and class antagonisms, we shall have an association in which the free development of each is the condition for the free development of all.

III. SOCIALIST AND COMMUNIST LITERATURE.

1. Reactionary Socialism.

a. Feudal Socialism.

Owing to their historical position, it became the vocation of the aristocracies of France and England to write pamphlets against modern bourgeois society. In the French revolution of July, 1830, and in the English reform agitation, these aristocracies again succumbed to the hateful upstart. Thenceforth, a serious political contest was altogether out of question. A literary battle alone remained possible. But even in the domain of literature the old cries of the restoration period* had become impossible.

In order to arouse sympathy, the aristocracy were obliged to lose sight, apparently, of their own interests, and to formulate their indictment against the bourgeoisie in the interest of the exploited working class alone. Thus the aristocracy took their revenge by singing lampoons on their new master, and whispering in his ears sinister prophecies of coming catastrophe.

In this way arose feudal socialism: half lamentation, half lampoon; half echo of the past, half menace of the future; at times, by its bitter, witty, and incisive criticism, striking the bourgeoisie to the very heart's core, but always ludicrous in its effect, through total incapacity to comprehend the march of modern history.

The aristocracy, in order to rally the people to them, waved the proletarian alms-bag in front of a banner. But the people, so often as it joined them, saw on their hindquarters the old feudal coats-of-arms, and deserted with loud and irreverent laughter.

One section of the French Legitimists and "Young England" exhibited this spectacle.

In pointing out that their mode of exploitation was different to that of the bourgeoisie, the feudalists forget that they exploited under circumstances and conditions that were quite different, and that are now antiquated. In showing that under their rule the

* Not the English Restoration, 1660-89, but the French Restoration, 1814-30.

proletariat never existed, they forget that the modern bourgeoisie is the necessary offspring of their own form of society.

For the rest, so little do they conceal the reactionary character of their criticism, that their chief accusation against the bourgeoisie amounts to this: that under the bourgeois *régime* a class is being developed which is destined to cut up root and branch the old order of society.

What they upbraid the bourgeoisie with is not so much that it creates a proletariat as that it creates a *revolutionary* proletariat.

In political practice, therefore, they join in all coercive measures against the working class; and in ordinary life, despite their highfalutin phrases, they stoop to pick up the golden apples dropped from the tree of industry, and to barter truth, love, and honor for traffic in wool, beet-root sugar, and potato spirit.*

Feudalism.

As the parson has ever gone hand in hand with the landlord, so has clerical socialism with feudal socialism.

Nothing is easier than to give Christian asceticism a socialist tinge. Has not Christianity declaimed against private property, against marriage, against the State? Has it not preached in the place of these charity and poverty, celibacy and mortification of the flesh, monastic life and mother Church? Christian socialism is but the holy water with which the priest consecrates the heart-burnings of the aristocrat.

b. Petty Bourgeois Socialism.

The feudal aristocracy was not the only class that was ruined by the bourgeoisie, not the only class whose conditions of existence pined and perished in the atmosphere of modern bourgeois society. The medieval bourgeois and the small peasant proprietors were the precursors of the modern bourgeoisie. In those countries which are but little developed industrially and commercially these two classes still vegetate side by side with the rising bourgeoisie.

In countries where modern civilization has become fully developed a new class of petty bourgeois has been formed, fluctuating between proletariat and bourgeoisie, and ever renewing itself as a supplementary part of bourgeois society. The individual members of this class, however, are being constantly hurled down into the proletariat by the action of competition, and as modern industry develops they even see the moment approaching when they will completely disappear as an independent section of modern society, to be replaced in manufactures, agriculture, and commerce by overlookers, bailiffs, and shopmen.

In countries like France, where the peasants constitute far more than half of the population, it was natural that writers who sided with the proletariat against the bourgeoisie should use in their criticism of the bourgeois *régime* the standard of the peasant and petty bourgeois, and from the standpoint of these intermediate classes should take up the cudgels for the working class. Thus arose petty bourgeois socialism. Sismondi was the head of this school, not only in France, but also in England.

This school of socialism dissected with great acuteness the contradictions in the conditions of modern production. It laid bare the hypocritical apologies of economists. It proved incontrovertibly the disastrous effects of machinery and division of labor; the concentration of capital and land in a few hands; overproduction and crises; it pointed out the inevitable ruin of the petty bourgeois and peasant, the misery of the proletariat, the anarchy in production, the crying inequalities in the distribution of wealth, the industrial war of extermination between nations, the dissolution of old moral bonds, of the old family relations, of the old nationalities.

In its positive aims, however, this form of socialism aspires either to restoring the old means of production and of exchange, and with them the old property relations and the old society, or to cramping the modern means of production and of exchange within the

* This applies chiefly to Germany where the landed aristocracy and squirearchy have large portions of their estates cultivated for their own account by stewards, and are, moreover, extensive beet-root sugar manufacturers and distillers of potato spirits. The wealthier British aristocracy are as yet rather above that; but they, too, know how to make up for declining rents by lending their names to floaters of more or less shady joint-stock companies.

framework of the old property relations that have been and were bound to be exploded by those means. In either case it is both reactionary and utopian.

Its last words are: corporate guilds for manufacture; patriarchal relations in agriculture.

Ultimately, when stubborn historical facts had dispersed all intoxicating effects of self-deception, this form of socialism ended in a miserable fit of the blues.

German or "True" Socialism.

The socialist and communist literature of France, a literature that originated under the pressure of a bourgeoisie in power, and that was the expression of the struggle against this power, was introduced into Germany at a time when the bourgeoisie in that country had just begun its contest with feudal absolutism.

German philosophers, would-be philosophers, and *beaux esprits* eagerly seized on this literature, only forgetting that when these writings immigrated from France into Germany French social conditions had not immigrated along with them. In contact with German social conditions, this French literature lost all its immediate practical significance, and assumed a purely literary aspect. Thus, to the German philosophers of the eighteenth century the demands of the first French Revolution were nothing more than the demands of "practical reason" in general, and the utterance of the will of the revolutionary French bourgeoisie signified in their eyes the laws of pure will, of will as it was bound to be, of true human will generally.

The work of the German *literati* consisted solely in bringing the new French ideas into harmony with their ancient philosophical conscience, or rather in annexing the French ideas without deserting their own philosophic point of view.

This annexation took place in the same way in which a foreign language is appropriated—*viz.*, by translation.

It is well known how the monks wrote silly lives of Catholic saints *over* the manuscripts on which the classical works of ancient heathendom had been written. The German *literati* reversed this process with the profane French literature. They wrote their philosophical nonsense beneath the French original. For instance, beneath the French criticism of the economic functions of money they wrote "Alienation of Humanity," and beneath the French criticism of the bourgeois State they wrote, "Dethronement of the Category of the General," and so forth.

The introduction of these philosophical phrases at the back of the French historical criticisms they dubbed "Philosophy of Action," "True Socialism," "German Science of Socialism," "Philosophical Foundation of Socialism," and so on.

The French socialist and communist literature was thus completely emasculated. And since it ceased in the hands of the German to express the struggle of one class with the other, he felt conscious of having overcome "French one-sidedness" and of representing not true requirements, but the requirements of truth; not the interests of the proletariat, but the interests of human nature, of man in general, who belongs to no class, has no reality, who exists only in the misty realm of philosophical phantasy.

This German socialism, which took its schoolboy task so seriously and solemnly, and extolled its poor stock-in-trade in such mountebank fashion, meanwhile gradually lost its pedantic innocence.

The fight of the German and, especially, of the Prussian bourgeoisie against feudal aristocracy and absolute monarchy, in other words, the liberal movement, became more earnest.

By this the long wished-for opportunity was offered to "true socialism" of confronting the political movement with the socialist demands, of hurling the traditional anathemas against liberalism, against representative government, against bourgeois competition, bourgeois freedom of the press, bourgeois legislation, bourgeois liberty and equality, and of preaching to the masses that they had nothing to gain and everything to lose by this bourgeois movement. German socialism forgot in the nick of time that the French criticism, whose silly echo it was, presupposed the existence of modern bourgeois society, with its corresponding economic conditions of existence, and the political constitution adapted thereto, the very things whose attainment was the object of the pending struggle in Germany.

To the absolute governments, with their following of parsons, professors, country squires, and officials, it

served as a welcome scarecrow against the threatening bourgeoisie.

It was a sweet finish after the bitter pills of floggings and bullets with which these same governments, just at that time, dosed the German working-class risings.

While thus "true" socialism thus served the governments as a weapon for fighting the German bourgeoisie, it, at the same time, directly represented a reactionary interest, the interest of the German Philistines. In Germany the *petty bourgeois* class, a *relique* of the sixteenth century, and since then constantly cropping up again under various forms, is the real social basis of the existing state of things.

To preserve this class is to preserve the existing state of things in Germany. The industrial and political supremacy of the bourgeoisie threatens it with certain destruction; on the one hand, from the concentration of capital; on the other, from the rise of a revolutionary proletariat. "True" socialism appeared to kill these two birds with one stone. It spread like an epidemic.

The robe of speculative cobwebs, embroidered with flowers of rhetoric, steeped in the dew of sickly sentiment, this transcendental robe in which the German socialists wrapped their sorry "eternal truths" all skin and bone, served to wonderfully increase the sale of their goods among such a public.

And on its part German socialism recognized more and more its own calling as the bombastic representative of the petty bourgeois Philistine.

It proclaimed the German nation to be the model nation, and the German petty Philistine to be the typical man. To every villainous meanness of this model the exact contrary of its real character. It went to the extreme length of directly opposing the "brutally destructive" tendency of communism, and of proclaiming its supreme and impartial contempt of all class struggles. With very few exceptions, all the so-called socialist and communist publications that now (1847) circulate in Germany belong to the domain of this foul and enervating literature.

2. Conservative or Bourgeois Socialism.

A part of the bourgeoisie is desirous of redressing social grievances, in order to secure the continued existence of bourgeois society.

To this section belong economists, philanthropists, humanitarians, improvers of the condition of the working class, organizers of charity, members of soperance fanatics, hole-and-corner reformers of every imaginable kind. This form of socialism has, moreover, been worked out into complete systems.

We may cite Proudhon's *Philosophie de la Misere* as an example of this form.

The socialistic bourgeois want all the advantages of modern social conditions without the struggles and dangers necessarily resulting therefrom. They desire the existing state of society minus its revolutionary geosie without a proletariat. They wish for a bourgeoisie conceives the world in which it is supreme to be the bourgeoisie socialism develops this comfortable conception into various more or less complete systems. In requiring the proletariat to carry out such a system, and thereby to march straightway into that the social New Jerusalem, it but requires in reality of existing society, but should cast away all its hateful ideas concerning the bourgeoisie.

A second and more practical, but less systematic form of this socialism sought to depreciate every revolutionary movement in the eyes of the working class, by showing that no mere political reform, but only a change in the material conditions of existence, in economical relations, could be of any advantage to them. By changes in the material conditions of existence, this form of socialism, however, by no means understands abolition of the bourgeois relations of production, an abolition that can be effected only by a revolution, but administrative reforms, based on the continued existence of these relations; reforms, therefore, that in no respect affect the relations between capital and labor, but at the best lessen the cost and simplify the administrative work of bourgeois government.

Bourgeois socialism attains adequate expression when, and only when, it becomes a mere figure of speech.

Free trade; for the benefit of the working class. Protective duties; for the benefit of the working class. Prison reform; for the benefit of the working class.

This is the last word and the only seriously meant word of bourgeois socialism.

It is summed up in the phrase: the bourgeois is a bourgeois for the benefit of the working class.

3. Critical-Utopian Socialism and Communism.

We do not here refer to that literature which, in every great modern revolution, has always given voice to the demands of the proletariat: such as the writings of Babeuf and others.

The first direct attempts of the proletariat to attain its own ends, made in times of universal excitement, when feudal society was being overthrown, for the time being necessarily failed, owing to the then undeveloped state of the proletariat, as well as to the absence of the economic conditions for its emancipation, conditions that had yet to be produced, and could be produced by the impending bourgeois epoch alone. The revolutionary literature that accompanied these first movements of the proletariat had necessarily a reactionary character. It inculcated universal asceticism and social leveling in its crudest form.

The socialist and communist systems properly so called, those of St. Simon, Fourier, Owen, and others, sprang into existence in the early undeveloped period, described above, of the struggle between proletariat and bourgeoisie. (See Section I. Bourgeoisie and Proletariat.)

The founders of these systems see, indeed, the class antagonisms, as well as the action of the decomposing proletariat in the prevailing form of society. But the spectacle of a class without any historical initiative or any independent political movement.

Since the development of class antagonism keeps even pace with the development of industry, the economic situation, as they find it, does not as yet offer to them the material conditions for the emancipation of the proletariat. They therefore search after a new social science, after new social laws, that are to create these conditions.

Historical action is to yield to their personal inventive action, historically created conditions of emancipation to fantastic ones, and the gradual, spontaneous organization of the proletariat to an organization of society specially contrived by these inventors. Future history resolves itself in their eyes into the propaganda and the practical carrying out of their social plans.

In the formation of their plans they are conscious of caring chiefly for the interests of the working class, as being the most suffering class. Only from the point of view of being the most suffering class does the proletariat exist for them.

The undeveloped state of the class struggle, as well as their own surroundings, cause socialists of this kind to consider themselves far superior to all class antagonisms. They want to improve the condition of every member of society, even that of the most favored. Hence, they habitually appeal to society at large, without distinction of class; nay, by preference, to the ruling class. For how can people, when once they understand their system, fail to see in it the best possible plan of the best possible state of society?

Hence, they reject all political, and especially all revolutionary action; they wish to attain their ends by peaceful means, and endeavor, by small experiments, necessarily doomed to failure, and by the force of example, to pave the way for the new social Gospel.

Such fantastic pictures of future society, painted at a time when the proletariat is still in a very undeveloped state, and has but a fantastic conception of its own position, correspond with the first instinctive yearnings of that class for a general reconstruction of society.

But these socialist and communist publications contain also a critical element. They attack every principle of existing society. Hence they are full of the most valuable materials for the enlightenment of the working class. The practical measures proposed in them, such as the abolition of the distinction between town and country, of the family, of the carrying on of industries for the account of private individuals, and of the wage system, the proclamation of social harmony, the conversion of the functions of the State into a mere superintendence of production—all these proposals point solely to the disappearance of class antagonisms which were, at that time, only just cropping up, and which, in these publications, are recognized under their earliest, indistinct and undefined forms only. These proposals, therefore, are of a purely utopian character.

The significance of critical-utopian socialism and communism bears an inverse relation to historical development. In proportion as the modern class struggle develops and takes definite shape, this fantastic standing apart from the contest, these fantastic attacks on it lose all practical value and all theoretical justification. Therefore, altho the originators of these systems were, in many respects, revolutionary, their disciples have, in every case, formed mere reactionary sects. They hold fast by the original views of their masters, in opposition to the progressive historical development of the proletariat. They, therefore, endeavor, and that consistently, to deaden the class struggle and to reconcile the class antagonisms. They still dream of experimental realization of their social utopias, of founding isolated "phalanstères," of establishing "home colonies," of setting up a "little Icaria"—duodecimo editions of the New Jerusalem, and to realize all these castles in the air, they are compelled to appeal to the feelings and purses of the bourgeois. By degrees they sink into the category of the reactionary conservative socialists depicted above, differing from these only by more systematic pedantry, and by their fanatical and superstitious belief in the miraculous effects of their social science.

They, therefore, violently oppose all political action on the part of the working class; such action, according to them, can only result from blind unbelief in the new Gospel.

The Owenites in England and the Fourierists in France respectively oppose the Chartists and the "Réformistes."

IV. POSITION OF THE COMMUNISTS IN RELATION TO THE VARIOUS EXISTING OPPOSITION PARTIES.

Section II. has made clear the relations of the communists to the existing working class parties, such as the Chartists in England and the agrarian reformers in America.

The communists fight for the attainment of the immediate aims, for the enforcement of the momentary interests of the working class; but in movement of the present, they also represent and take care of the future of that movement. In France the communists ally themselves with the social-democrats,* against the conservative and radical bourgeoisie, reserving, however, the right to take up a critical position in regard to phrases and illusions traditionally handed down from the great revolution.

In Switzerland they support the Radicals, without losing sight of the fact that this party consists of antagonistic elements, partly of democratic socialists, in the French sense, partly of radical bourgeois.

In Poland they support the party that insists on an agrarian revolution, as the prime condition for national emancipation, that party which fomented the insurrection of Cracow in 1846.

In Germany they fight with the bourgeoisie whenever it acts in a revolutionary way, against the absolute monarchy, the feudal squirearchy, and the petty bourgeoisie.

But they never cease, for a single instant, to instill into the working class the clearest possible recognition of the hostile antagonism between bourgeoisie and proletariat, in order that the German workers may straightway use, as so many weapons against the bourgeoisie, the social and political conditions that the bourgeoisie must necessarily introduce along with its supremacy, and in order that, after the fall of the reactionary classes in Germany, the fight against the bourgeoisie itself may immediately begin.

The communists turn their attention chiefly to Germany, because that country is on the eve of a bourgeois revolution, that is bound to be carried out under more advanced conditions of European civilization, and with a much more developed proletariat, than that of England was in the seventeenth, and of France in the eighteenth century, and because the bourgeois revolution in Germany will be but the prelude to an immediately following proletarian revolution.

In short, the communists everywhere support every revolutionary movement against the existing social and political order of things.

*The party then represented in Parliament by Ledru-Rollin, in literature by Louis Blanc, in the daily press by the *Réforme*. The name of social democracy signified, with these its inventors, a section of the democratic or republican party more or less tinged with socialism.

In all these movements they bring to the front, as the leading question in each, the property question, no matter what its degree of development at the time.

Finally, they labor everywhere for the union and agreement of the democratic parties of all countries.

The communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by the forcible overthrow of all existing social conditions. Let the ruling classes tremble at a communistic revolution. The proletarians have nothing to lose but their chains. They have a world to win.

Workingmen of all countries, unite!

As the preceding manifesto is the classical exposition of socialism or communism as it was held in the middle of the century, so the following manifesto may be taken as an authoritative representation of modern socialism, signed as it is by the leaders of societies representing all the phases of socialism held in England or indeed elsewhere, with the exception of Christian Socialism, for which see that article.

MANIFESTO OF THE JOINT COMMITTEE OF SOCIALIST BODIES (1893).

There is a growing feeling at the present time that, in view of the increasing number of socialists in Great Britain, an effort should be made to show that, whatever differences may have arisen between them in the past, all who can fairly be called socialists are agreed in their main principles of thought and action.

This is the more hopeful since, tho much has been made of those differences by the opponents of socialism, it is safe to say that they have been rather of less than more importance than similar disputes of the early days of great movements which have afterward become solid and irresistible. There has indeed been constant cooperation in propagandist work between the individual members of different organizations, and occasional cooperation between the organizations in political emergencies; but more than this is now needed if we are to make a serious advance in the work of gathering together and directing the great body of thought and feeling which is setting toward socialism.

Meanwhile, the necessity for the development of a new social order is getting more obvious to all thinking people, and without the growing aspirations toward socialism the outlook of modern civilization would be hopeless.

The vigorous propaganda which has been carried on for the last 12 years, and the complete change in the attitude of the working classes and the public generally toward socialism, could not but attract the notice, and perhaps excite the anxiety, of the politicians of the possessing classes; but they have shown hitherto that they have lacked both the will and the power to do anything effective toward meeting the evils engendered by our present system. In spite of factory acts and factory inspectors, in spite of sanitary legislation and royal commissions, the condition of the working people is, relatively to the increased wealth of the country, worse than it was 20 years ago. Children are still growing up among such surroundings and so insufficiently nourished that health and strength are for them an impossibility; dangerous and unwholesome trades, inflicting hideous diseases on those who work at them, are still carried on by the capitalists with impunity; overcrowding, accompanied by increasing rents, is the rule rather than the exception in all our great cities.

At the same time, the great and growing depression in the most vital of industries, agriculture, tends to drive the people more and more from the country into the towns, while it so narrows the field from which healthy and vigorous industrial recruits have been drawn in the past that the physical deterioration of our city population is more severely felt than ever before.

Moreover, the question of the unemployed is more pressing to-day than at any recent period. The incapacity of the capitalist class to handle the machinery of production without injury to the community has been demonstrated afresh by the crisis of 1890, itself following upon a very short period of inflation, since which time every department of trade and industry

The Situation.

has suffered from lack of initiative and want of confidence and ability among these "organizers of labor." As a result the numbers of the unemployed have increased rapidly; the prospect of any improvement is still remote; and the stereotyped official assurance that there is no exceptional distress only emphasizes the fact that it is prosperity, not distress, which is exceptional. Indeed, the greatest "prosperity" possible under the present system could only lessen the mass of those without occupation, and bring them down to a number manageable by the employers. Meantime, small improvements made in deference to the ill-formulated demands of the workers, tho for a time they seem almost a social revolution to men ignorant of their own resources and of their capacity for enjoyment, will not really raise the condition of the whole people.

In short, the capitalist system, by which we mean the established plan of farming out our national industries in private property lots, and trusting to the greed of the owners and

Capitalism. the competition between them to ensure their productive use, is the only arrangement possible in a society not organized enough to administer its own industry as a national concern. This shiftless method has indeed kept the shop open, so to speak, but at a frightful cost in human degradation, as might have been expected from its basis. All the investigations undertaken with a view to convicting socialists of exaggeration and one-sidedness in their attacks upon it have shown that the facts are worse than any socialist dared to surmise, and that half a century of ameliorative regulation by means of factory legislation and the like has failed to weaken the force of former exposures of capitalism.

Among recent anti-socialist statisticians Mr. Robert Giffen has been led by his own counterblast to socialism into the exclamation, "That no one can contemplate the present condition of the masses without desiring something like a revolution for the better." And the facts as to London poverty, laid bare by Mr. Charles Booth, dispose of the possibility of leaving things as they are; altho Mr. Booth, who is a conservative in politics, undertook his great inquiry expressly to confute what he then thought to be socialist overstatements. The horrible revelations concerning English home life made by the Society for the Prevention of Cruelty to Children have effectually dispelled the illusion that the cruelty and selfishness of the factory and mine have not infected the household, or that society can safely abandon its children to irresponsible private ownership any more than its land and capital.

Under these circumstances of a continued degradation of the really useful part of the population—a consequence as inherent in the present system of ownership as it was in the system of chattel slavery—the need for a new social order is obvious. Some constructive social theory is asked for, and none are offered except the feudal or Tory theory, which is incompatible with democracy; the Manchester or Whig theory, which has broken down in practice, and the socialist theory. It is, therefore, opportune to remind the public once more of what socialism means to those who are working for the transformation of our present un-socialist state into a collectivist republic, and who are entirely free from the illusion that the amelioration or "moralization" of the conditions of capitalist private property can do away with the necessity for abolishing it. Even those readjustments of industry and administration which are socialist in form will not be permanently useful unless the whole state is merged into an organized commonwealth. Municipalization, for instance, can only be accepted as socialism on the condition of its forming a part of national and at last of international socialism, in which the workers of all nations, while adopting within the borders of their own countries those methods which are rendered necessary by their historic development, can federate upon a common basis of the collective ownership of the great means and instruments of the creation and distribution of wealth, and thus break down national animosities by the solidarity of human interests throughout the civilized world.

On this point all socialists agree. Our aim, one and all, is to obtain for the whole community complete ownership and control of the means of transport, the means of manufacture, the mines, and the land. Thus we look to put an end forever to the wage-system, to sweep away all distinctions of class, and eventually to establish national and international communism on a sound basis.

To this end it is imperative on all members of the socialist party to gather together their forces in order

to formulate a definite policy and force on its general acceptance.

But here we must repudiate both the doctrines and tactics of anarchism. As socialists we believe that those doctrines and the tactics necessarily resulting from them, tho advocated as revolutionary by men who are honest and single-minded, are really reactionary both in theory and practice, and tend to check the advance of our cause. Indeed, so far from hampering the freedom of the individual, as anarchists hold it will, socialism will foster that full freedom which anarchism would inevitably destroy.

As to the means for the attainment of our end, in the first place we socialists look for our success to the increasing and energetic promulgation of our views among the whole people, and next to the capture and transformation of the great social machinery. In any case the people have increasingly at hand the power of dominating and controlling the whole political, and through the political, the social forces of the empire.

The first step toward transformation and reorganization must necessarily be in the direction of the limitation of class robbery, and the consequent raising of the standard of life for the individual.

In this direction certain measures have been brought within the scope of practical politics; and we name them as having been urged and supported originally and chiefly by socialists, and advocated by them still, not, as above said, as solutions of social wrongs, but as tending to lessen the evils of the existing régime: so that individuals of the useful classes, having more leisure and less anxiety, may be able to turn their attention to the only real remedy for their position of inferiority—to wit, the supplanting of the present state by a society of equality of condition. When this great change is completely carried out the genuine liberty of all will be secured by the free play of social forces with much less coercive interference than the present system entails.

The following are some of the measures spoken of above: An eight-hour law; prohibition of child labor for wages; free maintenance of all necessitous children; equal payment of men and women for equal work; an adequate minimum wage for all adults employed in the Government and Municipal services, or in any monopolies, such as railways, enjoying State privileges; suppression of all sub-contracting and sweating; universal suffrage for all adults, men and women alike; public payment for all public service.

The inevitable economic development points to the direct absorption by the State, as an organized democracy, of monopolies which have been granted to or constituted by companies, and their immediate conversion into public services. But the railway system is of all the monopolies that which could be most easily and conveniently so converted. It is certain that no attempt to reorganize industry on the land can be successful so long as the railways are in private hands, and excessive rates of carriage are charged. Recent events have hastened on the socialist solution of this particular question, and the disinclination of boards of directors to adopt improvements which would cheapen freight prove that in this, as in other cases, English capitalists, far from being enlightened by competition, are blinded by it even to their own interests.

In other directions the growth of combination, as with banks, shipping companies, and huge limited liability concerns, organized both for production and distribution, show that the time is ripe for socialist organization. The economic development in this direction is already so far advanced that the socialization of production and distribution on the economic side of things can easily and at once begin, when the people have made up their minds to overthrow privilege and monopoly. In order to effect the change from capitalism to cooperation, from unconscious revolt to conscious reorganization, it is necessary that we socialists should constitute ourselves into a distinct political party with definite aims, marching steadily along our own highway without reference to the convenience of political factions.

We have thus stated the main principles and the broad strategy on which, as we believe, all socialists may combine to act with vigor. The opportunity for deliberate and determined action is now always with us, and local autonomy in all local matters will still leave the fullest outlet for national and international socialism. We therefore confidently appeal to all socialists to sink their individual crotchets in a business-like endeavor to realize in our own day that complete communization of industry for which the economic

Program.

forms are ready and the minds of the people are almost prepared.

The Joint Committee of the Social-Democratic Federation, the Fabian Society, and the Hammersmith Socialist Society.

Signed on behalf of the undermentioned bodies :
H. W. LEE, Secretary Social-Democratic Federation.
EDWARD R. PEASE, Secretary Fabian Society.
EMERY WALKER, Secretary Hammersmith Socialist Society.

MANN, HORACE, was born in 1796 in Franklin, Mass His father was a farmer in limited circumstances, and the son was early taught self-reliance and independence by a severe and frugal life. He graduated at Brown University in 1819. He was admitted to the bar in 1823, elected to the Legislature in 1827, and in that body was active in the interests of education, public charities, and laws for the suppression of lotteries and intemperance. In the practice of his profession he adopted the principle never to take the unjust side of any case, and he is said to have gained four fifths of the cases entrusted to him, as all juries felt perfect confidence in the honesty of his purpose. From 1837-48 he was Secretary of the Massachusetts Board of Education. He introduced a thorough reform into the school system of the State, establishing normal schools, and instituting county educational conventions. He opposed corporal punishment in school discipline. He visited Europe, investigated the condition of the schools, and embodied his observations in a published report. By his lectures and writings he awakened an interest in the cause of education that had never been so strongly felt before. For 11 years he labored 15 hours a day in the interests of a completer education. In 1848 he was elected to Congress. His first speech, in that body was in advocacy of its right and duty to exclude slavery from the territories. "I consider no evil as great as slavery," he said. Opposing Webster on this question, he was defeated by one vote ; but on appealing to the people as an independent anti-slavery candidate, he was re-elected and served till 1853. He was nominated for Governor of Massachusetts by the Free Soil Party, but was unsuccessful. He was chosen President of Antioch College, Yellow Springs, O., accepted the office, and continued in it until his death in 1859.

MANN, TOM, was born at Foleshill, Warwickshire, April 15, 1856, the son of a colliery clerk. At the early age of nine he worked in coal mines, dragging on his hands and knees heavy trollies through low, dark passages. Gradually, however, he worked his way up, coming to serve an apprenticeship as machinist in Birmingham, and in 1877 going to London as an engineer. He also had a short experience

of work in the United States. He early became interested in social movements, and manifested a religious bent. Brought up in the Church of England, he left it for a while to try other churches. At Birmingham he was connected with the Quakers, and attended one of their Bible classes, as well as night schools of science and art. When he came to London he took a Sunday-school class at St. Stephen's, Westminster, but left it for Mr. Voysey's church, and later for the Swedenborgians at Argyle Square, where he was married to his devoted wife. He became an ardent teetotaler at Birmingham, and started "A Mutual Improvement Society." He read Spencer and Ruskin, and gave lectures to working men on astronomy ; but gradually became more and more especially interested in the labor movement. He commenced as a Henry George man, but soon became a socialist, and in 1885 joined the Social Democratic Federation, for which he worked as a lecturer and organizer, taking also a prominent part in the eight-hour agitation. While an engineer he had become interested in the Thames docks, and so in the terrible condition of the dockers, who, on account of irregularity of work and lowness of pay, were among the lowest class of London laborers. (See DOCK STRIKE.) Among these Mr. Mann especially worked, and a trades-union was formed, of which Mr. Mann, tho not a docker, was elected President. In the great London Dock Strikes (*q. v.*), which almost marks an epoch in the English labor movement, he was one of the chief leaders, and contributed largely to its satisfactory result. He also became a member of the Amalgamated Society of Engineers and of the London Trades Council. In 1891 he was appointed by the Conservative administration a member of the Royal Commission of Labor and signed the minority report. He was later chosen first secretary of the London Reform Union. He left this post, however, in a year to become the active and popular general secretary of the Independent Labor Party (*q. v.*), to which organization the efforts of his last years have been directed. In 1894 he was the Independent Labor Party candidate for Colne Valley, and again in 1895. In both cases he was defeated, but polled a large vote.

MANOR (from Latin *manere*, to remain) was the name given in medieval England to a landed estate. The exact nature of the English manor is, however, in dispute. Mr. E. Nasse, a German scholar, argues in a work on *Agricultural Communities of the Middle Ages in England*, that down to the Norman Conquest agricultural England was tilled by communities of free peasant proprietors, similar to the communal conception of the German *mark* (*q. v.*), and similar to the conception of the holding of primitive property advocated by De Laveleye and many others. Mr. F. Seebohm, in his *The English Village Communities* and the *English Manor*, has contested this opinion, and argues that the manor, as the estate of a lord or thane with villeins under him, was the original and universal system in England. Both views find defenders. (See PRIMITIVE PROPERTY.) Authorities, however, at present seem to incline to the views of Seebohm, with,

however, some modifications. The *marks*, even in Germany (see MARK), were probably not communities of absolute equals. There seem to have been from the earliest times *ceorls* or *eorls*, the latter being nobler blood, and from them being elected the ealdormen or rulers in peace and leaders in war. They led in council, tho the final decision seems to have been by the clash of arms of the ceorls. Gradually, however, the power of the eorl seems to have grown, and that of the ceorls to have lessened. As England under Alfred and others developed more settled unity, the power of the king was exalted, and the *eorl* becomes his *thegn* or representative, and the *ceorl*, the vassal or feudal inferior of the *eorl*, the ceorl losing his vote and becoming a serf of the soil. This change seems to have been gradual; the French *manor* of the conquest simply recognized changes long developed. Says Seebohm (*English Village Communities*, p. 76):

"These manors were, in fact, in their simplest form, estates of manorial lords, each with its village community in villenage upon it. The land of the lord's demesne—the home farm belonging to the manor-house—was cultivated chiefly by the services of the villata—i.e., of the village community or tenants in villenage. The land of this village community—i.e., the land in villenage—lay round the village in open fields. In the villages were the messuages or homesteads of the tenants in villenage, and their holdings were composed of bundles of scattered strips in the open fields, with rights of pasture over the latter for their cattle after the crops were gathered, as well as on the green commons of the manor or township."

These strips were due, according to Professor W. L. Birbeck (*Distribution of Land in England*), not to requirements of tenure, but the requirements of drainage, it being the custom to throw the land by means of the rude plows into ridges rising from the side to the middle. This view thus finds in the manor no trace of communal holding, but rather of a feudalism by no means light. See FEUDALISM.

MANUAL TRAINING. See INDUSTRIAL EDUCATION.

MANUFACTURES.—We give, under this heading, some general statistics of the growth and present development of manufacturing in the United States. (For other countries, see those countries. For details as to important industries, see those industries; for various other points, see FACTORY SYSTEM; LABOR LEGISLATION; MACHINERY; PRODUCTION; WAGES, etc.) American manufacturing during the colonial period was checked by the unwillingness of England to allow machines to be introduced into this country; but after the Revolution and the establishment of the Government, manufacturing developed fast. How it has recently gained on other industries is seen by the fact that in 1870 the agricultural product of the United States was \$333; manufacturing, \$680, and mining, \$717. In 1890 the figures were \$290, \$893 and \$740. Mr. Carroll D. Wright, in his *Industrial Evolution of the United States*, gives the following comparison between 1810 and 1860:

"For the first year the marshals employed in taking the census reported the value of goods manufactured by the loom, of cotton, wool, flax, hemp, and silk, with stockings, as stated, at \$39,497,957; other goods of these five materials, spun, \$2,052,120; instruments and

machinery manufactured, \$186,650; carding, fulling, and floor-cloth stamping by machinery, \$5,957,816; hats of wool, fur, etc., and of mixtures of them, \$4,323,744; manufactures of iron, \$14,364,520; manufactures of gold, silver, set work, mixed metals, etc., \$2,483,912; manufactures of lead, \$325,560; soap, tallow candles, wax, and spermaceti, spring oil and whale oil, \$1,766,292; manufactures of hides and skins, \$179,935,477; manufactures from seeds, \$88,509; grain, fruit, and case liquors, distilled and fermented, \$16,528,207; dry manufactures from grain, exclusively of flour, meal, etc., \$75,766; manufactures of wood, \$5,554,708; manufactures of essences and oils, of and from wood, \$179,150; refined or manufactured sugars, \$1,415,724; manufactures of paper, pasteboard, cards, etc., \$1,939,285; manufactures of marble, stone, and slate, \$462,115; glass manufactures, \$1,047,004; earthen manufactures, \$259,720; manufactures of tobacco, \$1,260,378; drugs, dye-stuffs, paints, etc., and dyeing, \$509,382; cables and cordage, \$4,243,168; manufactures of hair, \$129,731; various and miscellaneous manufactures, \$4,347,601.

"Mr. Tench Coxe, acting under the directions of the Secretary of the Treasury, Mr. Albert Gallatin, made a valuable analysis of the manufacturing products of the United States, and the foregoing figures are taken from his statement. His report was completed in May, 1813, and published by Congress. The total value of all the manufactures of the country in 1810, as given by Mr. Coxe, was \$127,694,602. By estimating the omitted products, Mr. Coxe extended this amount to \$172,762,676, and by adding some doubtful articles, embracing such manufactures as from their nature were nearly allied to agriculture, as, for example, cotton-pressing, flour and meal, productions of grain and saw-mills, the manufacture of bricks, tiles, and some other articles, he concluded that the aggregate value of the manufactures of every description in the United States in 1810 was \$198,613,474.

"The distribution of this vast product over the States shows that Pennsylvania stood at the head, with \$33,691,111, New York coming next with over \$25,000,000; then Massachusetts, with nearly \$22,000,000; Virginia, with \$15,250,000, in round numbers; Maryland, with nearly \$11,500,000; Connecticut, with over \$7,750,000; New Jersey, with over \$7,000,000; North Carolina, with over \$6,500,000; Kentucky, with over \$6,000,000, while Vermont, New Hampshire, Rhode Island, South Carolina, Georgia, and Maine manufactured products varying from \$3,500,000 to \$5,500,000, in round numbers.

"In 1860 the value of the products of American mechanical industries had reached \$1,885,861,676, but the statement by industries for that year cannot be given in detail. The values may be given for some of the principal industries, however. The total value of all kinds of cotton goods was \$115,681,774. The value of woollen goods was \$61,895,217. Clothing had by this time become a great industry. It had grown up within a few years of the close of the first period, and in all the principal cities had become an industry of magnitude and importance, the value of the product being \$73,219,765. The great industry of boots and shoes, which is closely allied to that of clothing, and which was, at the period being considered, beginning to feel the influence of the factory system of labor, represented, in 1860, a product worth \$91,891,498. . . .

"The distribution of the manufactures over the States and Territories in 1860 was, of course, far more general than in 1810, not only through the increase in the number of States and the extension of manufactures in consequence, but also over the States that were named for 1810. New York, however, led all the States in 1860, the value of her manufactures for the year being \$379,000,000. Pennsylvania came second, with over \$290,000,000, Massachusetts being third, with over \$255,000,000. These three States are the only ones which passed the \$200,000,000 line; and there was only one State coming between \$100,000,000 and \$200,000,000, Ohio, which produced \$122,000,000 worth of goods, while in 1810 her productions were too insignificant for mention. The States passing the \$50,000,000 line were Connecticut, with nearly \$82,000,000; New Jersey, with over \$76,000,000; California, with over \$68,000,000; Illinois, with over \$75,500,000; Virginia, with over \$50,500,000. All the other States came below the \$50,000,000 line."

For recent years, the abstract of the Eleventh Census gives the following statistics:

Products in 1810.

Products in 1813.

Products in 1860.

† North and South Dakota combined for 1890, to compare with Dakota Territory for 1880.

‡ See Dakota.

§ Part of Indian Territory in 1880.

The census abstract gives the following important cautions in drawing comparisons :

"First. The great increase shown in the reports for those industries coming under the head of 'hand trades' is largely due to the fact that no previous census has so fully reported such industries as carpentering, blacksmithing, painting and paper hanging, and plumbing and gas fitting. The following industries were omitted at the census of 1880, but are included in the totals presented for 1890—*viz.*, bottling; cars and general shop construction and repairs by steam railroad companies; china, decorating; clothing, women's, dressmaking; coffins and burial cases, trimming and finishing; cotton, cleaning and rehanding; cotton, ginning; cotton waste; drug grinding; druggists' preparations, not including prescriptions; gas, illuminating and heating; hay and straw, baling; and millinery, custom work. Petroleum, refining, formed part of a separate report at the census of 1880, and the statistics were not included in the report on manufactures. At the census of 1880 'mixed textiles' appeared as a distinct classification, but the data were largely duplicated under other heads of textile manufacture.

"Second. The questions respecting employees and wages used at the Eleventh Census required the average number and total wages of males, females, and children, respectively, to be reported by classes of officers or firm members, clerks, operatives, and skilled, unskilled, and pieceworkers. The questions used in the schedules on which the majority of the industries were reported at the Tenth Census called only for the 'greatest number of hands employed at any one time during the year,' also 'the average number of hands employed, males, females, and children, and the total wages,' without designating the different classes of employees. It is believed the questions used at the Eleventh Census have more fully developed the true average number of employees and total wages. The tendency of the questions used at 1880 was to obtain a number in excess of the average number of employees, while it is believed the questions used at 1890 obtained the average number. The questions at 1890 also tended to increase the amount of wages as compared with 1880. Therefore, the average annual wages per employee as obtained from the reports for the two censuses are not comparable, nor should the amounts be used to ascertain the percentage of increase.

"Third. With the exception of a number of selected industries, the questions respecting the cost of materials and value of products used at the Tenth Census were as follows: 'Value of materials (including mill

supplies and fuel),' 'Value of products (including jobbing and repairing),' 'Value of products (including jobbing and repairing).' The corresponding questions used at the Eleventh Census required separate statements as to the cost of the 'principal materials,' 'fuel,' 'mill supplies,' and 'all other materials,' also the value of the 'principal product' and 'all other products, including amounts received from custom work and repairing.' The cost of materials used is the reported cost at the place of consumption. The value of products is the reported value at the factory of the total product for the year, not including any allowance for commissions or expenses of selling.

"The difference between the sum of the wages and cost of materials and the value of manufactured product cannot be taken as indicating profit, because miscellaneous expenses are not included in these tables, and many items of expense enter into the mercantile portion of the business, which branch is not within the scope of the census inquiry. The data furnished in the reports of the Eleventh Census relating to depreciation of manufacturing plants are not sufficient to form a basis for correct computations, and therefore are omitted from these tables."

MARGIN OF CULTIVATION. See RICARDO.

MARK, THE, was, in the Middle Ages, in Germany, a tract of land belonging in common to a community of freemen who divided the cultivated portion or *arable mark* among their individual members, used the *common* or *ordinary mark* together for pasturage or general purposes, and dwelt in the village *mark* or central portion. (For a discussion of the question whether the *mark* system ever existed in England, see MANOR.) Whether it did or not, the *mark* seems to evidence the early organization of the Germanic tribes, from whence the English came, as they are described by Tacitus. According to Green's *History of the English People*, the members of the community holding the *mark* were freeholders, or *eorls*, tho there were among them *eorls*, distinguished by nobler blood, and from whom the *ealdormen* were

chosen as rulers in peace or leaders in war. The choice, however, was purely voluntary, and the *eorls* had no special legal privileges; and the preliminary discussions rested with the *eorls*, the clash of arms of the *eorls* was the final decision. The *witen*, or wise men, of the village met and settled disputes, and later, in England, came together as the *witenagemot*, the origin of Parliament. (For the much-discussed question whether these *marks* indicate an original communal holding of soil, see PRIMITIVE PROPERTY.) The probability seems to be that the organization was communal, not individualistic;

but the communities were more patriarchal than those of equal freemen.

MARRIAGE.—(For a discussion of the social problems connected with marriage, see FAMILY; DIVORCE.) We give here statistics as to marriage. (See also DIVORCE; POPULATION.)

I. UNITED STATES.

The population, according to conjugal condition, is given by the Census of 1890 as follows:

	Total.	Single.	Married.	Widowed.	Divorced.	Unknown.
Males.....	32,067,880	19,945,576	11,205,228	815,437	49,101	52,538
Females.....	39,554,470	17,183,988	11,126,196	2,154,615	71,895	17,676

In the following table the statistics for 1870 and 1880 are from the Report of the United

States Commissioner of Labor on marriage and divorce (1889) and for 1890 from the census:

STATES AND TERRITORIES.	POPULATION.			ESTIMATED MARRIED COUPLES.		FAMILIES.
	1870.	1880.	1890.	1870.	1880.	1890.
Alabama.....	996,992	1,262,505	1,513,017	188,431	238,613	287,292
Arizona.....	9,658	40,440	59,620	1,690	7,077	13,495
Arkansas.....	484,471	802,525	1,128,179	91,565	151,077	213,620
California.....	560,247	864,694	1,208,130	105,887	163,427	245,710
Colorado.....	39,864	194,327	419,198	6,976	34,007	84,276
Connecticut.....	537,454	622,700	746,258	101,579	117,690	165,890
Dakotas.....	14,181	135,177	511,527	2,482	23,056	34,578

Oregon.....	90,923	174,768	313,767	15,912	30,584	63,791
Pennsylvania.....	3,521,951	4,282,891	5,258,014	665,649	809,466	1,061,626
Rhode Island.....	217,353	216,551	246,531	34,550	52,264	75,010
South Carolina.....	705,606	995,577	1,151,149	133,366	188,164	222,941
Tennessee.....	1,258,520	1,542,359	1,767,518	237,860	291,506	334,194
Texas.....	818,579	1,591,749	2,235,523	154,711	300,841	411,251
Utah.....	86,786	143,993	207,905	15,188	25,194	38,816
Vermont.....	330,551	332,422	332,422	62,474	62,802	75,869
Virginia.....	1,225,163	1,512,565	1,655,980	231,556	285,875	304,673
Washington.....	23,955	75,116	349,390	4,192	13,145	70,977
West Virginia.....	442,014	618,457	762,794	83,544	116,888	140,359
Wisconsin.....	1,054,679	1,315,497	1,686,880	199,333	248,629	335,546
Wyoming.....	9,118	20,789	60,705	1,596	3,638	12,065
Total.....	38,558,371	50,155,783	62,007,880	7,281,310	9,464,908	12,690,152

This does not show the number of marriages which occur in the United States, because of the large number of married immigrants. As to the marriages occurring in the United States, there are no reliable statistics. The Report on

Marriage and Divorce quoted above gives Massachusetts, Connecticut, Rhode Island, and Ohio as the only States in which the number are fully reported. In these States the number of marriages were as follows :

YEARS.	Connecticut.	Massachu- setts.	Ohio.	Rhode Island.	Vermont.
1867.....	4,779	14,451	29,230	2,345	1,857
1868.....	4,734	13,856	28,231	2,285	2,061
1869.....	4,754	14,826	23,910	2,280	2,621
1870.....	4,971	14,721	22,459	2,362	2,928
1871.....	4,882	15,746	24,627	2,336	2,742
1872.....	5,023	16,142	26,303	2,537	2,749
1873.....	4,841	16,437	26,460	1,630	2,714
1874.....	4,694	15,564	26,678	2,531	2,724
1875.....	4,385	13,663	26,445	2,485	2,710
1876.....	4,320	12,749	26,183	2,253	2,642
1877.....	4,319	12,758	25,156	2,282	2,635
1878.....	4,315	12,893	25,706	2,323	2,770
1879.....	4,373	13,802	26,399	2,396	2,708
1880.....	4,745	15,538	27,805	2,769	2,697
1881.....	4,850	16,768	28,566	2,750	2,763
1882.....	5,329	17,684	30,528	2,634	2,883
1883.....	5,441	18,194	30,659	2,620	2,836
1884.....	5,394	17,333	28,720	2,528	2,676
1885.....	5,091	17,052	28,773	2,488	2,709
1886.....	5,497	18,018	28,634	2,750	2,588
1887.....	5,788	19,533
1888.....	5,969	19,739
1889.....	5,744	20,397
1890.....	6,284	20,838
1891.....	6,486	21,675
1892.....	6,596	22,507
1893.....	6,459	22,814
1894.....	5,830

II. EUROPE.

According to the Report of the Registrar of England, quoted in Professor Mayo-Smith's *Statistics and Sociology* (p. 95), the number of persons annually married per 1000 of the population was as follows :

COUNTRY.	Average. 1871-90.	1891.	1892.	1893.
Hungary (15 years).....	19.1	17.2	18.4	18.6
Prussia.....	16.7	16.3	16.1	16.1
German Empire.....	16.4	16.1	15.9	15.8
Austria.....	16.3	15.4	15.6
England and Wales.....	15.6	15.6	15.4	14.7
Italy.....	15.6	15.0	15.0	14.7
France.....	15.4	15.0	15.2
Denmark.....	15.2	13.6	13.6	14.1
Holland.....	15.1	14.2	14.4	14.6
Switzerland.....	14.7	14.4	14.8	14.7
The United Kingdom.....	14.4	14.6	14.5	13.9
Belgium.....	14.2	14.8	15.4	15.2
Scotland.....	13.9	13.9	14.1	13.2
Norway.....	13.7	13.2	12.7	12.8
Sweden.....	13.1	11.7	11.4
Ireland.....	9.0	9.2	9.3	9.4

III. VARIOUS STATISTICS.

Statistics of age at marriage differ very much between men and women in different countries and between different occupations. Professor Mayo-Smith (*Statistics and Sociology*, p. 104) quotes the following figures for England for the year 1884-85 :

	Age of Bachelors Marrying.	Age of Spinsters Marrying.
Miners.....	24.06	22.46
Textile hands.....	24.38	23.43
Shoemakers, tailors.....	24.02	24.31
Artisans.....	25.35	23.70
Laborers.....	25.56	23.66
Commercial clerks.....	26.25	24.43
Shopkeepers, etc.....	26.67	24.22
Farmers and sons.....	29.23	26.91
Professional and independent class.....	31.22	26.40

There seems to be a general tendency in England to defer marriage, for while in 1891 the average age of bachelors marrying was 26.4 and of spinsters 24.8, in 1880 it was only 25.8 and 24.4. The number of under-age marriages in England has steadily declined since 1874 from 8.4 per cent. for men and 22.7 per cent. for women down to 5.9 per cent. for men and 19 per cent. for women. In Prussia, in 1891, only 1.26 per cent. of the men and 16.5 per cent. of the women were under 20 years of age. In Prussia, the lowest average age at marriage was found among miners, printers, factory hands and day laborers; the highest among artists, literary men, inn-keepers, clergymen, and soldiers.

The cause for this is undoubtedly in the more expensive style of family living demanded by the more educated classes. Late marriages usually imply more early immorality, reduced population, etc. (See PROSTITUTION; MALTHUSIANISM.)

Concerning the fecundity of marriage, Professor Mayo-Smith quotes the following table (p. 113) :

COUNTRIES.	1876.	1888.
	Births to Marriages Six Years.	Births to Marriages of the Same Year.
Italy	5.15	4.5
Ireland	5.00	4.8
Prussia	4.92	4.1
Sweden	4.84	4.3
Holland	4.83	4.1
England	4.63	3.9
Belgium	4.48	3.9
Spain	4.47	4.5
Denmark	4.24	3.7
Austria	3.73	3.9
France	3.42	3.0

Reference : see FAMILY.

MARSHALL, ALFRED, was born in 1842 in England ; was educated in London, and at St. John's College, Cambridge. He was elected Fellow of his college in 1865, and Lecturer on Moral Science in 1868, which post he held till 1877, when he was appointed Principal of University College, Bristol. In 1879 he published his *Economics of Industry*, in connection with his wife (*née* Paley), whom he married in 1877. In 1881 ill health sent him abroad, but in 1883 he was appointed Lecturer on Political Economy at Balliol College, Oxford, and in 1884 he was elected to the Chair of Political Economy at Cambridge University, formerly held by Professor Fawcett. His new work, *The Principles of Economics*, published in 1890-91, is considered by many economists the most important recent English treatise on the subject.

MARSON, CHARLES LATIMER, now Vicar of Hambridge, Somersetshire, Eng., has held eight curacies and lost them largely for his activities in Christian Socialism. He was one of the first members of the Fabian Society, and in 1884 editor of the *Christian Socialist*. He went to Australia, and there founded the Australian Fabian Society. He is on the council of the Guild of St. Matthew, and trustee of the Busmen's Union. He has written brilliantly on the socialism of the Fathers, also *The Psalms at Work* (1894), and *Fairy Stories*, besides contributing to *Vox Clamantium* (1894); *The New Party* (1894) ; and regularly to *Goodwill* and *The Church Reformer*, etc.

MARX, KARL, was born in Treves, in 1818, of Jewish parentage. Studying at Jena, Bonn, and Berlin, he attracted early attention by his attainments in philosophy, and became a devoted Hegelian. He married a sister of a Prussian minister of state, and in 1842 edited the *Rheinische Zeitung*, of Cologne, till it was suppressed a year later for its radical utterances. He then went to Paris and made the acquaintance and friendship of Heine, Bakounin, Proudhon, Ruge, above all, of Engels. The two formed an intellectual partnership, and until Marx's death in 1883 they worked together in communistic agitation.

In Paris Marx undertook, with Arnold Ruge, the publication of an edition of Hegel's *Philosophy of Jurisprudence*, besides other literary

labors ; but having employed a paper, *Vorwärts*, to attack Prussia, the Prussian Government in 1846 asked his expulsion from France, which was granted, and he went to Brussels. Here Engels joined him, and the two formed a German Working Men's Association, having as its organ the *Deutsche Brüsseler Zeitung*. Their activity attracted the notice of a German communist league of Paris, which sent in 1847 to Marx in Brussels, and to Engels in Paris, asking them to enter the organization, and promising that a congress should be convened in London. The congress was held in the summer of 1847. As a result of this congress, and of another held at the end of the year, the theories of Marx were generally accepted, and he was asked to undertake with Engels the drawing up of a communist manifesto, which appeared early in the following year. (See MANIFESTO.) The manifesto was later adopted as the creed of the communists or socialists.
